BIOGRAPHICAL NOTE

SIGMUND FREUD 1856–1939

FREUD was born May 6, 1856, at Freiberg in what is now Czechoslovakia. When he was four the family moved to Vienna, and his father continued his trade as a small merchant. While following the usual course of studies at the *Gymnasium* where for seven years he was first in his class, Freud was attracted by Darwin's theories to the study of science. Although he had no "particular predilection for the career of physician," Freud later noted that it was upon hearing Goethe's beautiful essay *On Nature* ... just before I left school that I decided to become a medical student. In 1873 he entered the University of Vienna where, he records in his autobiographical sketch, he experienced the effects of anti-Semitic prejudice.

While pursuing his medical studies Freud began experimental investigation by studying the nervous system of the fish in the physiological laboratory of Ernst Brücke. After taking his medical degree in 1881 financial reasons compelled him to become an interne at the General Hospital. With the little spare time he had as an interne he pursued research at the Institute of Cerebral Anatomy on the subject of nervous diseases. The publication of several monographs on cerebral paralysis in children won him the post of lecturer in neuropathology at the university, and in 1885 he was awarded a traveling fellowship to advance his studies. Having become interested the previous year in Breuer's treatment of hysteria by hypnosis, during which the patient was induced to recollect his past, Freud now chose to pursue such investigation under Charcot, the neurologist, at the Sorbonne. Freud studied with him several months and was strengthened in his determination to take the then revolutionary step of investigating hysteria from a psychological point of view. Before returning home in 1886 he spent a few months at a children's clinic in Berlin and made extensive observations of the nervous disorders of children.

Upon his return to Vienna, Freud married [illegible] suggestion. He resumed his friendship with Breuer and in collaboration with him published in 1895 the *Studies in Hysteria*. The partnership was dissolved after the book was completed, and soon afterwards Freud took the decisive step of replacing hypnotism by the method of "free association." Largely as a result of his extensive clinical practice he turned to the analysis of dreams, and in 1900 provided the first statement of his doctrine in *The Interpretation of Dreams*.

Except for his brief collaboration with Breuer Freud for more than a decade "stood completely isolated" from the medical world, and his theories when not completely ignored, were the object of ridicule. It was not until 1902 that several young doctors began to gather around him with the intention of learning and practicing psycho-analysis, and from this group grew the Viennese Psycho-Analytic Society. Although his *Psychopathology of Everyday Life* (1904) received more favorable public notice, the opposition to his theories increased as soon as he began publishing his views on the sexual life of children. His work, however, soon began to receive international attention from the medical profession. The Burghölzli Clinic in Zurich, in 1906, was the first institution outside of Austria to adopt the method of psycho-analysis. By 1908 Freud had colleagues throughout Europe, including Adler, Brill, Ferenczi, Ernest Jones, Jung, Sadger, and Stekel, and in that year the first International Congress of Psycho-Analysis was held at Salzburg. In the following year at the invitation of Clark University Freud visited the United States and gave five lectures on his discoveries which were later published as the *Origin and Development of Psycho-Analysis*. With the establishment of the International Psycho-Analytic Association in 1910 Freud devoted his efforts with increasing success to the development of the psycho-analytic movement. Disagreement later led to a severance of relations between Freud and several of his closest associates, including Adler, Stekel, Rank, and Jung, but Freud was the acknowledged founder of psycho-analysis and the leader of the movement.

After 1912 Freud gave most of his time to directing the Psycho Analytic Society editing its various journals and writing many mono graphs Although his clinical practice was not as extensive as in previous years he still re mained active as an analyst and his records of the case histories of his patients cover almost fifty years At the University of Vienna during the two winter sessions between 1915 and 1917 he again explained his theories before a general public as he had in the United States in lec tures afterwards published as the *General In troduction to Psycho Analysis*

Until the end of the first World War Freud was mainly occupied with special problems concerning the unconscious and it was not until 1920 that he began to deal with the more general problems raised by his studies par ticularly with the factors making for what he called repression In 19 0 he published *Beyond the Pleasure Principle* and three years later the *Ego and the Id* As early as 1913 Freud had attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origin of religions and morality He now returned to the cultural problems which had fascinated me long before and published *The Future of an Illusion* (19 7) *Civili ation and its Discontents* (19 9) and *Moses and Monotheism* (1939) which was his last book

With the award of the Goethe Prize in 1930 when he was also given the freedom of the city of Vienna Freud reached what he described as the climax of my life as a citizen But soon afterwards Freud notes the boundaries of our country narrowed and the nation would know of us no more Upon the Nazi invasion of Austria in 1938 Freud s books were burned the *Psychoanalytische Verlag* directed by his son was destroyed and his passport con fiscated For years Freud had lived in virtual seclusion largely because of the development of a cancer of the mouth which cau ed him great pain He was finally allowed to leave Austria in 1938 after the payment of a large ransom With his wife a nephew and hi daughter Anna he went to England where another of his sons lived He died on September 23 1939 in Hampstead London

The Origin and Development of Psycho-Analysis

FIRST LECTURE[1]

LADIES AND GENTLEMEN It is a new and some what mbarras ing experience f r me to appear a lecture before students of the New World. I a..me that I we this ho our to the association o m name with the theme f psycho-analysis and consequently t is of psycho-analysis that I s..all am t speak. I shall attempt to give you in very brief form ..n historical survey of the ori gin a..d further development of this new method of resea ch and cur

Grant d that it s a merit to ha e created psy cho-a..al sis t is n t my merit. I was a student busy with th passing of my last examinations when anoth r physician of V enna Dr Joseph Breuer made the first applicatio of this method to the case f an hysterical girl (1880-82) W must now examine the history of this case a..d ts treatment, which can be found in detail in *Studie ber Hysterie* later published by Dr Breuer and myself

But first one word. I ha e noticed, with con siderab..e satisfacti that the majority of my hearers do not bel ng t the medi al p fes.. n Now do t fea that a medical ed cation is nec essary to follow what I shall have t say We shall now cc mpany the doctors a little way but soon we shall take lea e of them and fol low Dr Breuer on a way which is quite his own

Dr B euer's patient was a girl of twenty-one of a high degree of intelligence She had devel oped in th course of h r two years illness se ries of phys cal and ment l disturba es which well deserved to be taken seriously She had a seve e paralysis of both right ext emities with anaesthesia, and t times th same affectu n f the members f th l ft side of the body dis turban e f eye mo ements d much impai ment f vis on difficulty in maintain g the po s tion of th head an intense *Tussis n rr sa* nausea when sh attempted to take no n..h ment and at on time f r everal w eks a loss f th pow to drink, in p t f t rmenting thirst Her power of peech was also dimini hed and this progres..ed so f r that she could ne ther speak nor understand her mother tongue and finally she was subject to states of absence of confusion delirium alteration of her whole per onality These states will later claim our at te tion

Wh o e hears of such a ca e one does not need to be a physician to incline to the op nion that we re concerned h re with a serious injury us however that in one type of cases w th just as unf ourable sympt ms an ther far more favourable opinion is justified. When one finds such a series of symptoms in the case of a young girl whose vital organs (heart, kid eys) are sh wn by objective tests to be normal but who has suff red from stro g emotional disturb ances and when the symptoms differ in certain fine characteristics from what ne m ght logi cally expect, *in a case like this the doctors* are not too much disturbed. They consider that there is present no organic les on of th brain but that enigm t cal state known since the time of the G eek phys cians as hysteria which can *simulate a whole series of symptoms of arious* diseases They cons der in uch a ca..e that the life of the patient is not in danger and that a res toration to health will probably c me abo t f t..elf The differentiation of such an hysteria from a severe rganic lesion is not always very easy B t we d not need to know how a differ ential diagnosis of this kind is made you may be u that the case of B eue s pat ent was such that no skillful physician could f il t diag nose an hyst ria W may also add a wo d here from th history f th case. The illness first ap peared while the patient was caring f her fa th wh m she *tend rly lo* ed during the evere illn ss which led to hi d th a task which he was compelled to aband n because she herself fell ill.

So f t has eemed best to go with the doc tors but we shall soon part company with them

[1] These lectures were delivered Cla k University in 909

powerless but also in the case of hysterical af fections the doctor can do nothing He must leave it to benign nature when and how his hopeful prognosis will be realized [1] Accordingly with the recognition of the disease as hysteria little is changed in the situation of the patient but there is a great change in the attitude of the doctor We can observe that he acts quite dif ferently toward hystericals than toward patients suffering from organic diseases He will not bring the same interest to the former as to the latter since their suffering is much less serious and yet seems to set up the claim to be valued *just as seriously*

But there is another motive in this action The physician who through his studies has learned so much that is hidden from the laity can realize in his thought the causes and altera tions of the brain disorders in patients suffering from apoplexy or dementia a representation which must be right up to a certain point for by it he is enabled to understand the nature of each symptom But before the details of hyster ical symptoms all his knowledge his anatomi cal physiological and pathological education desert him He cannot understand hysteria He is in the same position before it as the layman And that is not agreeable to any one who is in the habit of setting such a high valuation upon his knowledge Hystericals accordingly tend to lose his sympathy he considers them persons who overstep the laws of his science as the or thodox regard heretics he ascribes to them all possible evils blames them for exaggeration and intentional deceit simulation and he punish es them by withdrawing his interest

Now Dr Breuer did not deserve this reproach in this case he gave his patient sympathy and interest although at first he did not understand how to help her Probably this was easier for him on account of those superior qualities of the patient s mind and character to which he bears witness in his account of the case

His sympathetic observation soon found the means which made the first help possible It had been noticed that the patient in her states of absence of psychic alteration usually mum bled over several word to herself These seemed to spring from associations with which her thoughts were busy The doctor who was able to get these words put her in a sort of hypnosis and repeated them to her over and over in order to bring up any associations that they might have The patient yielded to his suggestion and reproduced for him those psychic creations which controlled her thoughts durin, her ab sences and which betrayed themselves in the e single spoken words These were fancies deep ly sad often poetically beautiful day dreams we might call them which commonly took as their starting point the situation of a girl beside the sick bed of her father Whenever she had re lated a number of such fancies she was as it were freed and restored to her normal mental life This state of health would last for several hours and then give place on the next day to a new absence which was removed in the same way by relating the newly created fancies It was impossible not to get the impression that the psychic alteration which was expressed in the absence was a consequence of the excita tions originating from these intensely emotion al fancy images The patient herself who at this time of her illness strangely enou^h understood and spoke only English gave this new kind of treatment the name talking cure or jokingly designated it as chimney sweeping

The doctor soon hit upon the fact that through such cleansing of the soul more could be accomplished than a temporary removal of the constantly recurring mental clouds Symp toms of the disease would disappear when in hypnosis the patient could be made to remem ber the situation and the associative connexions under which they first appeared provided free vent was given to the emotions which they aroused There was in the summer a time of in tense heat and the patient had suffered very much from thirst for without any apparent reason she had suddenly become unable to drink She would take a glass of water in her hand but as soon as it touched her lips she would push it away as though suffering from hy drophobia Obviously for these few seconds she was in her absent state She ate only fruit mel ons and the like in order to relieve this torment ing thirst When this had been going on about six weeks she was talking one day in hypnosis about her English governess whom she disliked and finally told with every sign of disgust how she had come into the room of the governess and how that lady s little dog that she abhorred had drunk out of a glass Out of respect for the

[1] I k w that this w no l ger h lds tod y b t th l t I tak my lf d my h rs b k t th t m bef re 188 If th gs h bec m d ff t si th t t m t h bee l g ly d t th w k th h t ry of wh ch I m sk tch g

conventions the patient had remained silent Now after she had gi en energetic exp es o to her restrained anger he ked for a dri k drank a large quantity of water without trouble and woke f om hypnosis with the glass at her lips The symptom thereupon vanished perma nently

Permit me to dwell f r a moment on this ex perience. No one had ev cu ed an hysterical

hard to suppress her tears so that the sick man might not see them

All the pathogenic impressions sprang from the time when she shared in the care of her s ck father Once she was watching at night in the greatest anxiety for the patient, who was in a high fe er and in suspense for a surgeon was expected from V enna to operate on the pa tient Her mother had gone out for a little while and Anna sat by the sick bed her right arm

t symptoms originated in this way an to d be removed by the same method Breuer spared no pains to nce himself of this and in esti gated the pathogenesis of the other more erious symptoms in a more o de ly way Such was in deed the case almost all the symptoms origi nated in exactly this way as remnants as pre cipitates, if you like of aff ct ely to ed expe rien es which for that rea on we later called *psych c traum ta* The natu e of the symptoms became clear through their relation to the scene which caus d them They were to use the tech nical term *d term ned* (*determiniert*) by the scene whose memory traces they embodied and so could no longer be d cribed as arbitrary or enigmatical functions of the neurosis

Only one variation from what might be ex pected must be mentioned It was not always a single experience which occas oned the symp tom but usually several perhaps many similar repeated traumata cooperat d in this effect It was necessary to repeat the whole series of path ogenic memori s in chro ological equence and of course, in reverse o der the last first and the first last It was quit impossible to reach th first and often most essential trauma directly without first clearing away those coming later

You will, of course want to hea me speak of th r examples f the causation f hysterical symptoms beside this of inab lity *to dri k on* account of the disgust caused by th dog drink ing from th glass I must h wever f I hold to my p ogram limit myself to v ry few examples. Breuer relates fo instance that his pati t s visual disturbances could be traced back t ex ternal causes in the f llowing way "The pa t ent w h

meadow behind the house that she had already been frightened by them a d that these former experiences furnished the material for the hallu cination) She tried to dri e off the creature but was as though paralyzed. Her right arm which was hanging o er the back of the chair had gone to sleep become anaesthetic and paret c a d as she was looking at it, the fingers changed into little snakes with deaths heads (The nails) Probably she attempted to drive away the snake with her paralyzed right hand and so the anaesthesia and paralys s of this member f rmed associations with the sn ke hal lucinati When this had an shed she tried in her anguish to speak but could not. She could not express herself in any language until finally she thought f the words of an English nursery

ment ended.

When a number of years later I began to use Bre er s resea ches and treatment on my own pati t my experie ces completely coincided with his In the c e of a woman of about forty *there was a tic peculiar smacking* noise which manifested it elf whenever he was labouring under any exc tement without any obvious ca se It had its rigin in two experiences which had this common element that she attempted to make n n se b t that by a sort of counter will thi no se broke the stillness On the fi st occas o he had finally after much trouble put her s ck child to sleep and she tried to be very quiet s a not to awaken it On the s cond oc cas on during a ride with both her children in a thunderst rm the h rses took fright and he

You must not think that the outlook of a patient with regard to medical aid is essentially bettered when the diagnosis points to hysteria rather than to organic disease of the brain Against the serious brain diseases medical skill is in most cases powerless but also in the case of hysterical affections the doctor can do nothing He must leave it to benign nature when and how his hopeful prognosis will be realized [1] Accordingly with the recognition of the disease as hysteria little is changed in the situation of the patient but there is a great change in the attitude of the doctor We can observe that he acts quite differently toward hystericals than toward patients suffering from organic diseases He will not bring the ame interest to the former as to the latter since their suffering is much less serious and yet seems to set up the claim to be valued *just as seriously*

But there is another motive in this action The physician who through his studies has learned so much that is hidden from the laity can realize in his thought the causes and alterations of the brain disorders in patients suffering from apoplexy or dementia a representation which must be right up to a certain point for by it he is enabled to understand the nature of each symptom But before the details of hysterical symptoms all his knowledge his anatomical physiological and pathological education desert him He cannot understand hysteria He is in the same position before it as the layman And that is not agreeable to any one who is in the habit of setting such a high valuation upon his knowledge Hystericals accordingly tend to lose his sympathy he considers them persons who overstep the laws of his science as the orthodox regard heretics he ascribes to them all possible evils blames them for exaggeration and intentional deceit simulation and he punishes them by withdrawing his interest

Yo e that we are in a fair way to arrive at a *pu ely psycholog cal theory of hysteri* in which we ass gn th fi st ra k to the affective p o esses A s cond ob rv tion of Bre er com pels us to ascr be to the alte ed conditio f con c o ess a great part i determ n ng the characteristics of the di as His pat e t show d m y so ts of mental tates c ndit ons of absence c fu on a d alter tion of char a ter bes d s her ormal state In her n rm l state she was entirely igno ant of the pathogen c sce s and of the connecti with her symp toms She h d *forgotten th se sc nes* r at any rate had dis ociated them from the path genic connect on Whe the pati t w s hyp otized t was poss ble afte co s d rable difficulty to e c ll th s enes to her memory a d by this means f e all the symptoms were removed It ld have bee extremely perplexing to know how t interpret thi fact if hypnot c pract e and experiments had not po ted out the way Th gh th tudy of hypn tic phenomena the co ceptio st ge though t was t first has be me f milia that in o e a d the same i di vidual eve l ment l gr p gs a e po ble hi h m y main elati ely independent f ea h oth *k w tl* g of each other nd h h m y ause a plitting of co sciousnes al ng li es which they l y d wn Ca es of s h a s rt kn wn *d bl pe sonal ty* (*double consc en e*) ccas nally appea spo ta eously

If such a div sion of per onality conscious h one of *us men* In the ost hyp given in te as

symptoms originated in such peculiar mental states which he called *hypnoidal states* (*hypno de Zustande*) Experiences of an emotional nature which occur during such hypnoidal states easily become pathogenic since such states do not present the conditions for a normal drai ng off of the emotion of the exciting proc esses And as a re ult there arises a peculiar product of this exciting process that is the

orig ated

I am fra d that this portion of my treatment will not seem very clear but you must remem ber th t we are deal ng here with new a d diff cult v ws wh ch perhaps could not be made much cle rer This all goes to show that our knowledge in this field is not yet very far ad vanced *Breue s idea of the hypno dal states* has mor over been shown to be superfluous and a h d a ce to further investigat on and

wh ch B eue limited the caus l moment

Y u ha e probably lso felt a d rightly that B euer s i vestigat ons gave you nly a very inc mplete theory a d insuffic ent explanat on of the phe omena which w have observed But c mplete theories d ot fall f om Heaven a d

of an unp ejud ced i e t g t o of the facts

carefully avoided any noise for fear of frighten ing them still more [1] I give this example instead of many others which are cited in the *Studien uber Hysterie*

Ladies and gentlemen if you will permit me to generalize as is indispensable in so brief a presentation we may express our results up to this point in the formula *Our hysterical pa tients suffer from reminiscences* Their symptoms are the remnants and the memory symbols of certain (traumatic) experiences

A comparison with other memory symbols from other sources will perh ps enable us better to understand this symbolism The memorials and monuments with which we adorn our great cities are also such memory symbols If you walk through London you will find before one of the greatest railway stations of the city a richly decorated Gothic pillar—Charing Cross One of

of this ad journey [2] In another part of the city you will see a high pillar of more modern con *struction which is merely called* the Monu ment This is in memory of the great fire which broke out in the neighborhood in the year 1666 and destroyed a great part of the city These monuments are memory symbols like the hys

the funeral of Queen Eleanor instead of going

er who before the Monument bemoaned the burning of his loved native city which long since has arisen again so much more splendid than before?

Now hystericals and all neurotics behave like these two unpractical Londoners not only in that they remember the painful experiences of the distant past but because they are still strongly affected by them They cannot escape from the past and neglect present *reality in its* favour This fixation of the mental life on the

pathogenic traumata is an essential and prac tically a most significant characteristic of the neurosis I will willingly concede the objection which you are probably formulating as you think over the history of Breuer s patient All her traumata originated at the time when she was caring for her sick father and her symp toms could only be regarded as memory sym bols of his sickness and death They corre pond to mourning and a fixation on thoughts of the dead so short a time after death is certainly not pathological but rather corresponds to normal emotional behavior I concede this there is nothing abnormal in the fixation of feeling on the trauma shown by Breuer s patient But in other cases like that of the tic that I have men tioned the occasions for which lay ten and fif teen years back the characteristic of this ab normal clinging to the past is very clear and Breuer s patient would probably have developed it if she had not come under the cathartic treatment such a short time after the trauma tic experiences and the beginning of the disease

We have so far only explained the relation of the hysterical symptoms to the life history of the patient now by considering two further factors which Breuer observed we may get a *hint as to the processes of the beginning of the* illness and those of the cure With regard to the first it is especially to be noted that Breuer s patient in almost all pathogenic situations had to suppress a strong excitement instead of giv ing vent to it by appropriate words and deeds In the little experience with her governess dog she suppressed through regard for the conven tions all manifestations of her very intense dis gust While she was seated by her father s sick bed she was careful to betray nothing of her anxiety and her painful depression to the pa tient When later she reproduced the same scene before the physician the emotion which she had suppressed on the occurrence of the scene burst out with especial strength as though it had been pent up all along The symptom which had been caused by that scene reached its greatest intensity while the doctor was striv ing to revive the memory of the scene and van ished after it had been fully laid bare On the

some peculiar chance there is no development of emotion It is apparently these emotional processes upon which the illness of the patient and the restoration to health are dependent We feel justified in regarding *emotion* as a quantity

which may become increased d n ed and d s pa ed S we are f ced to the conclusion that the patient fell ill becau.e the emotio d el oped in the pathogenic situation was pre ented from e.cap g normally and that the essence of t.e sickness lies in the f ct that these *mprıs ord (engeklemmt)* em tio s undergo a series of abnormal changes. I part they are preserved as a lasting charge and as a source of constant d. urbance in psychical life in part they under go a change into unusual bodily innervations a.d i.hibitions which present themselves as t.e phys cal sympt ms of the case We ha e coi.ed the name *hysterical conv sion* for the la t r process Part of our mental energy is un der rmal conditions co ducted ff by way of ph s cal innervati n and g es what we call *the exp e sion of em t ons* Hysterical convers on exag sates this part of the course of a mental process which is emotionally col ured it corre sponds to a f r m e intense em t onal expres sion, which finds utlet by new paths If a s ream flows in two channels an erflow of o e will take pla as soon as the curre t in the oth meets with an bstacle

Yo see that we are in a fair way to arri e at a purely psychological theory of hy teria in which we as gn th first rank to the affecti e processes. A second bservation of Breuer c m pe.s us to ascribe to the altered condition of consciousness a great part in determining the ch.racteristics of the disease His pati nt i.owed m

had dissocia ed them from thei pathogenic connection. When the patient was hypnotized, it was possible, after considerabl difficulty to e call those cenes to her memory and by this means of recall, th symptoms were removed. It would ha been extremely perplexing to kn w how t interpret this f ct if hypnotic practice a.d experiments had not pointed out the way Through the study f hypnotic phenomena, the conception, s.ra... though t was at first, has becom familar that in one and the sam indi vidual several mental groupings are possible w...ch may remain relatively independent of each oth know nothing of each other and w..ich may caus a splitting f consciousness along lines which th y lay down. Cases of su h a sort k own as *d bl per onal ty (double con sc ne*) o asionally appear spontaneously If in such a division of personal ty consci us- ne s remains con tantly bound up with o e of the two states this is called the *conscious* men tal state and the other the *unconscious* In the

though by an imperative suggest o we have an excellent basis for understanding how the un conscious state can influe ce the conscious al though the latter is ignorant of the existence of the former In the same way it is quite possible to explain the facts in hysterical cases. Breuer came to the conclusion that the hysterical symptoms originated in such peculiar mental states which he called *hypn idal states (hyp noide Zust nde)* Experiences of an emotional nature which occur during such hypno dal tates e sily become path genic since such states do not present the conditions for a normal draining off of the emotion of the exciting proc es es And as a result there ari.es a peculiar p oduct of this exciting process, that is the symptom and this is projected like a foreign body int the normal state The latter has, then no conception of the s gnificance of the hyp- no dal pathogenic situation Where a symptom ari.es we al.o find an amnesia a memory gap and the filling of this gap includes the removal of the conditions under which the symptom originat d.

I am afraid that this portion of my treatment will not seem very clea but you must remem ber that we are dealing here with new and diffi

vanced Breuer s idea of the hypno dal states has mo eo er been shown to be superfl ous and a hindrance to further investigation a d has been dropped from present co ceptions of psycho-analysis. Later I shall at least suggest what ther influences and p oces.es ha e been disclo ed besides that of the hypno dal states to whi h B eue limited the causal moment.

Yo ha e p obably also felt, and rightly that B euer' investigations gave you only a very incompl te theory and insufficient explanati n of the phen mena which we have observed. But complete theories d not fall f m Hea en, and yo would have had still greate reason to be distrustful, had any one ffered yo at th be- ginning f his bservations a well rounded the ory without any gaps such a theory could only be the child f his specu.ati ns d n t th fruit of an unprejudi ed investiga.ion of the f cts

SECOND LECTURE

LADIES AND GENTLEMEN At about the same time that Breuer was using the talking cure *with his patient M Charcot began in Paris* with the hystericals of the Salpetrière those researches which were to lead to a new understanding of the disease These results were however not yet known in Vienna But when about ten years later Breuer and I published our preliminary communication on the psychic mechanism of hysterical phenomena which grew out of the cathartic treatment of Breuer s first patient we were both of us under the spell of Charcot s investigations We made the pathogenic experiences of our patients which acted as psychic traumata equivalent to those physi*cal traumata whose influence on hysterical pa*ralyses Charcot had determined and Breuer s hypothesis of hypnoidal states is itself only an echo of the fact that Charcot had artificially reproduced those traumatic paralyses in hypnosis

The great French observer whose student I was during the years 1885–86 had no natural bent for creating psychological theories His student *P Janet was the first to attempt to* penetrate more deeply into the psychic processes of hysteria and we followed his example when we made the mental splitting and the dissociation of personality the central points of our theory Janet propounds a theory of hysteria which draws upon the principal theories of heredity and degeneration which are current in France According to his view hysteria is a

[illegible]

hysterical patient is from the start incapable of *correlating and unifying the manifold of his* mental processes and so there arises the tendency to mental dissociation If you will permit me to use a banal but clear *illustration Janet s* hysterical reminds one of a weak woman who has been shopping and is now on her way home laden with packages and bundles of every description She cannot manage the whole lot with her two arms and her ten fingers and soon she drops one When she stoops to pick this up another breaks loose and so it goes on

Now it does not *agree very well with* this assumed mental weakness of hystericals that there can be observed in hysterical cases besides the phenomena of lessened functioning examples of a partial increase of functional capacity as a sort of compensation At the time when Breuer s patient had forgotten her moth

er tongue and all other languages save En lish her control of English attained such a level that if a German book was put before her she could give a fluent perfect translation of its contents at *sight When later I undertook* to continue on my own account the investigations begun by Breuer I soon came to another view of the origin of hysterical dissociation (or splitting of consciousness) It was inevitable that my views should diverge widely *and radically for my* point of departure was not like that of Janet laboratory researches but attempts at therapy Above everything else it was practical needs that urged me on The cathartic treatment as Breuer had made use of it presupposed that the patient should be put in deep hypnosis for only in hypnosis was available the knowled e of his *patho enic associations which were unknown* to him in his normal state Now hypnosis as a fanciful and so to speak mystical aid I soon came to dislike and when I discovered that in spite of all my efforts I could not hypnotize by any means all of my patients I resolved to give up hypnotism and to make the cathartic method independent of it

Since I could not alter the psychic state of most of my patients at my wish I directed my efforts to working with them in their normal state This seems at first sight to be a particularly senseless and aimless undertaking The problem was this to find out something from the patient that the doctor did not know and the patient himself did not know How could *one hope to make such a method succeed? The* memory of a very noteworthy and instructive proceeding came to my aid which I had seen

[illegible]

periences had only apparently lost the memory of those somnambulic experiences and that *their memory of them could be awakened even* in the normal state If he asked them about their experiences during somnambulism they said at first that they did not remember but if he persisted urged assured them that they did know then every time the forgotten memory came back

Accordingly I did this with my patients When I had reached in my procedure with them a point at which they declared that they knew nothing more I would assure them that they *did know that they must just tell it out and* I would venture the assertion that the memory which would emerge at the moment that I laid my hand on the patient s *forehead would be the*

right one In this way I ucceeded with ut hypnos.s in learning from the patient all that was ecessary for a con truction of the connection between the f rg tten pathogenic scenes and the sym oms which they had left behind. This was a tro blesome and in its length an exhaustin proceeding a d did not lend itself to a fin hed techn que B t I did not gi e t up without drawing definit conclusions from the data which I had gained. I had ubstantiated the fact that the f rgotten memories w re not lost. They were in the po essi n of the patient ready to emerge and form as ciations with his other men al con ent but hindered from becoming consci us and for ed to remain in the uncon ci us by som sort of a force. The existence of this f rce could be assumed with certainty for in ttempting to drag up th unconscious mem ories into the consciousness of the patient in opposition to this force one got the sensation of his own personal effort stri ing to overcome it. On could get an dea f this force which main tained the pathological situati n, from the re si tance of th patient.

... that I based my

ess, mu t themselves ha e caused the forg t ting and repressed from onsciousnes the pathogenic experiences I called this hypothet cal process *ep ssion* (*Verd a gung*) and co side ed that it was pro ed by the undeni ble ex istence f esistance

But now the question arose what were tho e f ces and what were the co diti ns of this re pression, in which we were now ble to rec gnize the pa hogenic mechanism f hysteria? A com parati e tudy of the pathogenic situations which th cathartic treatment has m d possi bl llows us t answer this quest on. In ll those experiences t had happened that a wish

tient pers nality The had been h rt con fl t and th end f this inn truggle was th repression of the de which present d t elf t con cio ess as the bearer of this irreconcil able wi h. This was the ep essed f om n sc ousness and forgotten. The incompatibility of the idea in question with the *ego* of the pa tient was the mot e of the repression the eth cal and other preten ions of the indi dual were the repre sing forces. The presence of the in compatible wi h or the duration of the confl ct, had gi en ri e to a high degree of mental pain this pain was a o ded by the repres ion This latter process is ev dently in such a case a d vice for the protection of the personality

I will not multiply examples but will gi e you th hi tory of a ingle one of my cases in which

ca a d omit many valuable in erat o s It is that of a young gi l who was deeply attached to her father who had died a hort time bef re and in whose care she had sh red—a ituation analogous to that of Breu er s patient. When her older sister married the girl grew to feel a peculiar sympathy for her new brother in law which easily passed with he f r family tenderness. This sister soon fell ill and d ed, while the patient and her mother were away The absent ones were hastil re called without being told fully of the pa ful

... by the beds de of her

me We may be sure that this dea which betrayed to h r consciousness her intense love for her brothe in law of which she had not been consci us was the next moment consigned to repress on by her revolted feelings The girl fell ill with severe hysterical symptoms and when I came to treat the ca e it appeared that she had entirely forgotten that scene at her s ter s bed de and the unn tural egoistic desire wh ch had arisen in he She remembered t durin the treatment, reproduced the pathogenic mome t with every sign f intense emotional excitement and was cured by this treatment.

Pe haps I can m ke the process of repression and its necessary elation to the resistance f the patient m re co crete by a rough llu tra tion which I will derive f m ou present s tua tion

distracts my ttention from my task. I explain

See *Selected P per on Hy teria* p 53 below

that I cannot go on with my lecture under these conditions and thereupon several stron men among you get up and after a short struggle eject the disturber of the peace from the hall He is now *repressed* and I can continue my lecture But in order that the disturbance may not be repeated in case the man who has just been thrown out attempts to force his way back into the room the gentlemen who have executed my suggestion take their chairs to the door and establish themselves there as a *resistance* to keep up the repression Now if you transfer both locations to the psyche calling this *consciousness* and the outside the *unconscious* you have a tolerably good illustration of the process of repression

We can see now the difference between our theory and that of Janet We do not derive the psychic fission from a congenital lack of capacity on the part of the mental apparatus to synthesize its experiences but we explain it dynamically by the conflict of opposing mental forces we recognize in it the result of an active striving of each mental complex against the other

New questions at once arise in great number from our theory The situation of psychic conflict is a very frequent one an attempt of the ego to defend itself from painful memories can be observed everywhere and yet the result is not a mental fission We cannot avoid the assumption that still other conditions are necessary if the conflict is to result in dissociation I willingly concede that with the assumption of *repression* we stand not at the end but at the very beginning of a psychological theory But we can advance only one step at a time and the completion of our knowledge must await further and more thorough work

Now do not attempt to bring the case of Breuer s patient under the point of view of repression This history cannot be subjected to such an attempt for it was gained with the help of hypnotic influence Only when hypnosis is excluded can you see the resistances and repressions and get a correct idea of the pathogenic process Hypnosis conceals the resistances and so makes a certain part of the mental field freely accessible By this same process the resistances on the borders of this field are heaped up into a rampart which makes all beyond inaccessible

The most valuable things that we have learned from Breuer s observations were his conclusions as to the connection of the symptoms with the pathogenic experiences or psychic traumata and we must not neglect to evaluate this result properly from the standpoint of the repression theory It is not at first evident how we can get from the repression to the creation of the symptoms Instead of giving a complicated theoretical derivation I will return at this point to the illustration which I used to typify repression

Remember that with the ejection of the rowdy and the establishment of the watchers before the door the affair is not necessarily ended It may very well happen that the ejected man now embittered and quite careless of consequences gives us more to do He is no longer among us we are free from his presence his scornful laugh his half audible remarks but in a certain sense the repression has miscarried for he makes a terrible uproar outside and by his outcries and by hammering on the door with his fists interferes with my lecture more than before Under these circumstances it would be hailed with delight if possibly our honoured president Dr Stanley Hall should take upon himself the role of peacemaker and mediator He would peak with the rowdy on the outside and then turn to us with the recommendation that we let him in again provided he would guarantee to behave himself better On Dr Hall s authority we decide to stop the repression and now quiet and peace reign again This is in fact a fairly good presentation of the task devolving upon the physician in the psycho analytic therapy of neuroses To say the same thing more directly we come to the conclusion from working with hysterical patients and other neurotics that they have not fully succeeded in repressing the idea to which the incompatible wish is attached They have indeed driven it out of consciousness and out of memory and apparently saved themselves a great amount of psychic pain *but in the unconscious the suppressed wish still exists* only waiting for its chance to become active and finally succeeds in sending into consciousness instead of the repressed idea a disguised and unrecognizable surrogate creation (*Ersat bildung*) to which the same painful sensations associate themselves that the patient thought he was rid of through his repression This surrogate of the suppressed idea—the symptom—is secure against further attacks from the defenses of the ego and instead of a short conflict there originates now a permanent suffering We can observe in the symptom besides the tokens of its disguise a remnant of traceable similarity with the originally repressed idea the way in which the surrogate is built up can be discovered during the psycho analytic treatment of the patient and for his cure the symptom must

be traced back over the same route to the re pre sed idea If this repressed material is once more mad part of the conscious mental func t ns— process which suppo es the overcom ing of considerable resi ta ce—the psychic con flict which then arises the same which the pa tient wished to a o d is made capable of a happier termin tion under the guidance of the phy sician than is off red by represst n There are several pos ble suitable decis ons which can bring onflict and n u osis to a happy end in particula ca es the attempt m y be made to combine everal of these E ther the personal ty of the patient may be co vinced that he has been wrong in rej ctin the pathogenic wish d h may be mad t accept it either wholly or in part or this wi h may itself be directed to a higher goal which is f ee from object on by

tal faculties one s ce ds in ma tering his w hes by co cious thought

F rg e me if I ha e not been able to present mo e clea ly these main points f the t eatment which is tod y known as *psycho-analysis* The difficulties d not lie m ely in the newness of the bje t

R g ding the natu e of the unacceptable ishes whi h s eed n making the r influence f it out of th unc sci us in sp te of repres- s and regarding the question of what subjec t e and c tit t onal factors must be p esent fo h fa lur of ep ession a d ch a sur rogate or sympt m creat on to take place we will speak in later rem ks

THIRD LECTURE

LADIES AND GENTLEME It s not always easy to tell th truth e pec ally when o e must be b ef d so today I m t c rrect an incorrect tatement that I mad in my l st lecture

I t ld yo h w when I ga e up using hypnosis I p e sed my patients to tell me what came into th r m ds that had t d with the p oblem we w w ki g on I t ld them that they would remember what they had appa ently forg tten a d that th thought whi h rrupted into c n sci usness (*Einfall*) w uld ly embody the memory for wh ch we w re se king I claimed that I b tanti ted the fact that the first idea of my patients b ought the right clew and could be h wn t be the forgotte o ti ati of the mem ry Now this is not always s I ep esent ed it as being so s mple only for purposes of abbreviation In fact it would only happen the fi st time that the right forg tten material would emerge through simple pressure on my part. If the experience was continued, deas emerged in every case which *could not be the right ones* for they were not to the purpose and the patients themselves rejected them as incorrect Pres ure was of no further serv ce here and one could only egret again havi g given up hypnosis In this state of perplexity I clung to a prejudice which years later was proved by my frie d C G Jung of the University of Zurich and his pupils

latter could be satisfactorily explained by the hypothet cal psychological situatio In the pa

a d on the other hand the resistance which we have seen which set tself against the emer gence of the suppressed idea or ts associates in to co sciousness In case this resistance was

the greater the resistance to the emergence of the idea Thoughts which broke into the pa

c mpletely di gu sed under the influ ce of the resistances These surrogates must howeve show a certain similarity with the ideas which a e the object of our search by virtue of the r nature as symptoms and when the resistance is not too intensi e it is possible from the nature of these irruptions to di cove the hidd n bject of our sea ch. Th s mu t be el ted to the re p essed thought as a sort of allus as a state me t of the same thing in *direct terms*

We know cases in normal psy h logy in which an logou s t t s to the one which we h e assum d gi e rise to simila experiences Such

a case is that of wit By my study of psycho analytic technique I was necessarily led to a consideration of the problem of the nature of wit I will give one example of this sort which too is a story that originally appeared in English

The anecdote runs [1] Two unscrupulous business men had succeeded by fortunate speculations in accumulating a large fortune and then directed their efforts to breaking into good society Among other means they thought it would be of advantage to be painted by the most famous and expensive artist of the city a man whose paintings were considered as events The costly paintings were first shown at a great soirée and both hosts led the most influential connoisseur and art critic to the wall of the salon on *which the portraits were hung to elicit his admiring* judgment The critic looked for a long time looked about as though in search of something and then merely asked pointing out the vacant space between the two pictures And where is the Saviour?

I see that you are all laughing over this good example of wit which we will now attempt to analyse We understand that the critic means to say You are a couple of malefactors like those between whom the Saviour was crucified But he does not say this he expresses himself instead in a way that at first seems not to the purpose and not related to the matter in hand but which at the next moment we recognize as an *allusion* to the insult at which he aims and as a perfect surrogate for it We cannot expect to find in the case of wit all those relations that our theory supposes for the origin of the irruptive ideas of our patients but *it is my desire to lay stress* on the similar motivation of wit and irruptive idea Why does not the critic say directly what he has to say to the two rogues? Because in addition to his desire to say it straight out he is actuated by strong opposite motives It is a proceeding which is liable to be dangerous to offend people who are one s hosts and

duces the irruptive idea as a surrogate for the forgotten idea which is the object of the quest

Ladies and gentlemen it is very useful to designate a group of ideas which belong together and have a common emotive tone according to the custom of the Zurich school (Bleuler Jung and others) as a *complex* So we can say that if we set out from the last memories of the patient to look for a repressed complex that we have every prospect of discovering it if only the patient will communicate to us a sufficient number of the ideas which come into his head So we let the patient speak along any line that he desires and cling to the hypothesis that nothing can occur to him except what has some indirect bearing on the complex that we are seeking If this method of discovering the repressed complexes seems too circumstantial I can at least assure you that it is the only available one

In practising this technique one is further bothered by the fact that the patient often stops is at a standstill and considers that he has nothing to say nothing occurs to him If this were really the case and the patient were right our procedure would again be proven inapplicable Closer observation shows that such an absence of ideas never really occurs and that it only appears to when the patient holds back or rejects the idea which he perceives under the influence of the resistance which disguises itself as critical judgment of the value of the idea The patient can be protected from this if he is warned in advance of this circumstance and told to take no account of the critical attitude He must say anything that comes into his mind fully laying aside such critical choice even though he may think it unessential irrelevant nonsensical especially when the idea is one *which is unpleasant to dwell on By following* this prescription we secure the material which sets us on the track of the repressed complex

These irruptive ideas which the patient himself values little if he is under the influence of the resistance and not that of the physician are for the psychologist like the ore which by simple methods of interpretation he reduces from its crude state to valuable metal If one desires to gain in a short time a preliminary knowledge of the patient s repressed complexes without going into the question of their arrangement and associations this examination may be conducted with *the help of the association* experiments as Jung[2] and his pupils have perfected

tients but is indispensable in the investigations of the psychoses which have been begun by the Zurich school with such valuable results

This method of work with whatever comes into the patient's head when he submits to psy ... v ... hn cal ... e

serve the same purpose ... if his dreams and the evaluation of acts which he bungles or does without intending it (*Fehl und Z... handlungen*)

I might say, esteemed hearers, that for a long time I hesitated whether instead of this hurried survey of the whole field of psycho-analysis I should not rather offer you a thorough consideration of the analysis of dreams ... purely subjective and apparently secondary motive decided me against this. It seemed rather an impropriety ... devoted to practical ... rns ... n.

In erp tation of dreams is in fact the ... ra re pa t the interpretation of the unconscious the surest ground of psycho-analysis and a field in which every worker must win his convictions and gain his education. If I were asked how one could become a psycho-analyst, I should answer through the study of his own dreams. With great tact all opponents of the psycho-analytic theory have so far either evaded any criticism of *The Interpretation of Dreams* or have attempted to pass over it with the most superficial objections. If ... the contrary you will undertake the solution of the problems of dream life, the novelties which psycho-analysis present to your thoughts will no longer be difficulties.

ful health during waking life. It does not sound at all absurd to say that whoever regards these normal sense illusions these delusions and alterations of character as matter for amazement instead of understanding has not the least prospect of understanding the abnormal creations of diseased mental states in any other than the lay sense. You may with confidence place in this lay group all the psychiatrists of today. Follow me now on a brief excursion through the field of dream problems.

In our waking state we usually treat dreams with as little consideration as the patient treats the irruptive ideas which the psycho-analyst demands from him. It is evident that we reject them, for we forget them quickly and completely. The slight valuation which we place on them is based, with those dreams that are not confused and nonsensical, on the feeling that they are foreign to our personality, and, with other dreams, on their evident absurdity and senselessness. Our rejection derives support from the unrestrained shamelessness and the immoral longings which are obvious in many dreams. Antiquity, as we know, did not share this light valuation of dreams. The lower classes of our people today stick close to the value which they set on dreams; they, however, expect from them, as did the ancients, the revelation of the future. I confess that I see no need to adopt mystical hypotheses to fill out the gaps in our present knowledge, and so I have never been able to find anything that supported the hypothesis of the prophetic nature of dreams. Many other things, which are wonderful enough, can be said about them.

And first, not all dreams are so foreign to the d... re in... comprehensible

ple and easy to interpret. The young child always dreams of the fulfilment of wishes which were aroused in him the day before and were not satisfied. You need no art of interpretation to discover this simple solution, you only need to inquire into the experiences of the child on the day before ("the dream day"). Now it ... f ... ctory solution

analysis of the dream.

these dreams have undergone a process of disguise; the psychic content which underlies them was originally meant for quite different verbal expression. You must differentiate between the *manifest dream-content* which we remember in the morning only confusedly and with difficulty clothe in words which seem arbitrary, and the *latent dream-thoughts*, whose presence in the unconscious we must assume. This distortion of the dream (*Traumentstellung*) is the same proc

a case is that of wit By my study of psycho analytic technique I was necessarily led to a consideration of the problem of the nature of wit I will give one example of this sort which too is a story that originally appeared in English

The anecdote runs [1] Two unscrupulous business men had succeeded by fortunate speculations in accumulating a large fortune and then directed their efforts to breaking into good society Among other means they thou ht it would be of advantage to be painted by the most famous and expensive artist of the city a man whose paintings were considered as events The costly paintings were first shown at a great soiree and both hosts led the most influential connoisseur and art critic to the wall of the salon on which the portraits were hung to elicit his admiring judgment The critic looked for a long time looked about as though in search of some thing and then merely asked pointing out the vacant space between the two pictures And where is the Saviour?

psycho-analytic treatment of neuroses. From what has been said, you can easily understand how the interpretation of dreams, if it is not made too difficult by the resistance of the patient, can lead to a knowledge of the patient's secreted and repressed wishes and the complexes which he is nourishing. I may now pass to that group of everyday mental phenomena whose study has become a technical help for psycho-analysis.

These are the bungling of acts (*Fehlhandlungen*) among normal men as well as among neurotics, to which no significance is ordinarily attached; the forgetting of things which one is supposed to know and at other times really does know (...

reading (*Verlesen*), the automatic execution of purposive acts in wrong situations (*Vergreifen*) and the loss or breaking of objects, etc. These are trifles, for which no one has ever sought a psychological determination, which have passed unchallenged as chance experiences, as consequences of absent-mindedness, inattention and similar conditions. Here, too, are included the acts and gestures executed without being noticed by the subject, to say nothing of the fact that he attaches no psychic importance to them; as playing and trifling with objects, humming melodies, handling one's person and clothing, and the like.

These little things, the bungling of acts, like the symptomatic and chance acts (*Symptom- und Zufallshandlungen*) are not so entirely without meaning as is generally supposed by a sort of tacit agreement. They have a meaning, generally easy and sure to interpret from the situation in which they occur, and it can be demonstrated that they either express impulses and purposes which are repressed, hidden if possible from the consciousness of the individual, or that they spring from exactly the same sort of repressed wishes and complexes which we have learned to know already as the creators of symptoms and dreams.

It follows that they deserve the rank of symptoms, and their observation, like that of dreams, can lead to the discovery of the hidden complexes of the psychic life. With their help one will usually betray the most intimate of his secrets. If these occur so easily and commonly among people in health, with whom repression has on the whole succeeded fairly well, this is due to their insignificance and their inconspicuous nature. But they can lay claim to high theoretic value, for they prove the existence of repression and surrogate creations even under the conditions ...

... arbitrary and lawless, he expects everywhere a ... whose causal need is satisfied with a single psychic cause.

Now, keeping in mind the means which we possess for the discovery of the hidden, forgotten, repressed things in the soul life, the study of the irrupting ideas called up by free association, the patient's dreams, and his bungled and symptomatic acts; and adding to these the evaluation of other phenomena which emerge during the psycho-analytic treatment, on which I shall later make a few remarks under the heading of *transfer* (*Übertragung*), you will come with me to the conclusion that our technique is already sufficiently efficacious for the solution of the problem of how to introduce the pathogenic psychic material into consciousness, and so to do away with the suffering brought on by the creation of surrogate symptoms.

The fact that by such therapeutic endeavours our knowledge of the mental life of the normal and the abnormal is widened and deepened can, of course, only be regarded as an especial attraction and superiority of this method.

I do not know whether you have gained the impression that the technique through whose arsenal I have led you is a peculiarly difficult one. I consider that, on the contrary, for one who has mastered it, it is quite adapted for use. But so much is sure, that it is not obvious, that it must be learned no less than the histological or the surgical technique.

You may be surprised to learn that in Europe we have heard very frequently judgments passed on psycho-analysis by persons who knew nothing of its technique and had never practised it, but who demanded scornfully that we show the correctness of our results. There are among these people some who are not in other things unacquainted with scientific methods of thought, who, for example, would not reject the result of a microscopical research because it cannot be

This subject is ... treated in *The Psychopathology of Everyday Life*.

ess which has been revealed to you in the inves tigations of the creations (*symptoms*) of hys terical subjects it points to the fact that the same opposition of psychic forces has its share in the creation of dreams as in the creation of symptoms

The manifest dream content is the disguised surrogate for the unconscious dream thou hts and this disguising is the work of the defensive forces of the ego of the resistances These pre vent the repressed wishes from entering con sciousness during the waking life and even in the relaxation of sleep they are still strong enough to force them to hide themselves by a sort of masquerading The dreamer then knows just as little the sense of his dream as the hys terical knows the relation and significance of his symptoms That there are latent dream thoughts and that between them and the manifest dream content there exists the relation just described —of this you may convince your elves by the analysis of dreams a procedure the technique of which is exactly that of psycho analysis You must abstract entirely from the apparent con nection of the elements in the manifest dream and seek for the irruptive ideas which arise through free association according to the psy cho analytic laws from each separate dream element From this material the latent dream thoughts may be discovered exactly as one di vines the concealed complexes of the patient from the fancies connected with his symptoms and memories From the latent dream thoughts which you will find in this way you will see at once how thoroughly justified one is in inter preting the dreams of adults by the same rubrics as those of children What is now subtituted for the manifest dream content is the real sense of the dream is always clearly comprehensible as ociated with the impressions of the day before and appears as the fulfilling of an unsatisfied wish The manifest dream which we remember after waking may then be described as a *dis*

— 1

thoughts as the manifest dream content We call this process *dream work* (*Traumarbeit*) This de erves our fullest theoretical interest since here as nowhere else we can study the un suspected psychic processes which are existent in the unconscious or to express it more exact ly *between* two such separate systems as the conscious and the unconscious Among these newly discovered psychic processes two con densation *(Verdichtung)* and displacement or transvaluation change of psychic accent (*Verschiebung)* stand out most prominently Dream work is a special case of the reaction of different mental groupings on each other and as such is the consequence of psychic fission In all essen tial points it seems identical with the work of disguise which changes the repres ed complex in the case of failing repression into symptoms

You will furthermore discover by the analysis of dreams most convincingly your own the un suspected importance of the role which impres sions and experiences from early childhood exert on the development of men In the dream life the child as it were continues his existence in the man with a retention of all his traits and wishes including those which he was obliged to allow to fall into disuse in his later years With irresisti ble might it will be impressed on you by what processes of development of repression sub limation and reaction there arises out of the child with its peculiar gifts and tendencies the so called normal man the bearer and partly the victim of our painfully acquired civilization I will also direct your attention to the fact that we have discovered from the analysis of dreams that the unconscious makes use of a sort of sym bolism especially in the pre entation of exual complexes This symbolism in part varies with the individual but in part is of a typical nature and seems to be identical with the symbolism which we suppose to lie behind our myths and legends It is not impossible that these latter creations of the people may find their explana tion from the study of dreams

Finally I must remind you that you must not be led astray by the objection that the occur rence of anxiety dreams *(Angsttraume)* con tradicts our idea of the dream as a wish fulfil ment Apart from the consideration that anxiety dreams also require interpretation before judg ment can be passed on them one can sav quite generally that the anxiety does not depend in such a simple way on the dream content as one might suppose without more knowledge of the facts and more attention to the conditions of neurotic anxiety Anxiety is one of the ways in which the ego relieves itself of repressed wishes which have become too strong and so is easy to explain in the dream if the dream has gone too *far towards the fulfillin of the objectionable* wish

You see that the investigation of dreams was justified by the conclusions which it has gi en us concerning things otherw se hard to under stand But we came to it in connection with the

ecly when these memory traces which almost always are forgotten are discovered and made conscious is the power developed to banish the symptoms. We arrive here at the same conclusion as in the investigation of dreams—that it is the incompatible repressed wishes of childhood which lend their power to the creation of symptoms. Without these the reactions upon later traumata discharge normally. But we must consider these mighty wishes of childhood very generally as sexual in nature.

Now I can at any rate be sure of your astonishment. Is there an infantile sexuality you will ask. Is childhood not rather that period of life which is distinguished by the lack of the sexual impulse. No gentlemen it is not at all true that the sexual impulse enters into the child at puberty as the devils in the gospel entered into the swine. The child has his sexual impulses and activities from the beginning, he brings them with him into the world and from these the so-called normal sexuality of adults emerges by a significant development through manifold

—

whose walls we now stand. In this ... es titled A Preliminary Study of the Emotion of Love between the Sexes, which appeared three years before my *Three Contributions to the Theory of Sex* the author says just what I have been saying to you "The emotion of sex love does not make its appearance for the first time at the period of adolescence as has been thought. He has as we should say in European work ... by the American method and has gathered not less than 2500 positive observations in the course of fifteen years among them 800 of his own. He says of the signs by which this amorous condition manifest itself. The unprejudiced mind in observing these manifestations in hundreds of couples of children cannot escape referring them to sex origin. The most exacting mind ... satisfied when to these observations are added the confessions of those who have as children experienced the emotion to a marked degree of intensity and whose memories of childhood are relatively distinct. Those of you who are unwilling to believe in infantile sexuality will be most astonished to hear that among those children who fell in love so early not a few are of the tender ages of three, four and five years.

It would not be surprising if you should believe the observations of a fellow-countryman ... short time

ago in this room an observation ... er girl who from the same cause as my patient —the birth of a little child in the family—be... almost the same secret excite... ngly ... end ... that was so strange at first. I might also ... the remarkable example of the Zurich psychiatrist E. Bleuler who said a few years ago openly that he faced my sexual theories incredulous and bewildered and since that time by his own observations had substantiated them in their whole scope. If it is true that most men medical observers and others do not want to know anything about the sexual life of the child, the fact is capable of explanation only too easily. They have forgotten their own infantile sexual activity under the pressure of education for civil...

sis-analysis by an interpretation of your own childhood memories.

Lay aside your doubt and let us evaluate the infantile sexuality of the earliest years. The sexual impulse of the child manifests itself as a very complex one, it permits of an analysis into many components which spring from different sources. It is entirely disconnected from the function of reproduction which it is later to serve. It permits the child to gain different sorts of pleasure sensations which we include by the anal gues and connections which they show under the term sexual pleasures. The great source

Coll... d P... per ... III; Bleuler, Sexuelle Abnormitäten der Kinder ... IX, 98 ... *Three Contributions to the Theory of Sex*.

confirmed with the naked eye in anatomical preparations and who would not pass judgment until they had used the microscope But in matters of psycho analysis circumstances are really more unfavourable for gaining recognition Psycho analysis will bring the repressed in mental life to conscious acknowledgment and every one who judges it is himself a man who has such repressions perhaps maintained only with difficulty It will consequently call forth the same resistances from him as from the patient and this resistance can easily succeed in di guising itself as intellectual rejection and bring forward arguments similar to those from which we protect our patients by the basic principles of psycho analysis It is not difficult to substantiate *in our opponents the same impairment of in*telligence produced by emotivity which we may observe every day with our patients The arrogance of consciousness which for example rejects dreams so lightly belongs—quite generally—to the strongest protective apparatus which guards us against the breaking through of the unconscious complexes and as a result it is hard to convince people of the reality of the unconscious and to teach them anew what their conscious *knowledge contradicts*

FOURTH LECTURE

LADIES AND GENTLEMEN At this point you will be asking what the technique which I have described has taught us of the nature of the pathogenic complexes and repressed wishes of neurotics

One thing in particular psycho analytic in

ponents (*Triebkomponente*) and necessitate the assumption that to disturbances of the erotic sphere must be ascribed the greatest significance among the aetiological factors of the disease This holds of both sexes

think that I overestimate the aetiological share of the sexual moments They ask me why other *mental excitations* should not lead to the phenomena of repression and surrogate creation which I have described I can give them this answer that I do not know why they should not do this I have no objection to their doing it but experience shows that they do not possess such a significance and that they merely support the effect of the sexual moments without being able to supplant them This conclusion was not a theoretical postulate in the *Studien uber Hysterie* published *in 1895* with Dr Breuer I did not stand on this ground I was converted to it when my experience was richer and had led me deeper into the nature of the case Gentlemen there are among you some of my closest friends and adherents who have travelled to Worcester with me Ask them and they will tell you that they all were at first completely skeptical of the assertion of the determinative significance of the exual aetiology until they were compelled by their own analytic labors to come to the same conclusion

The conduct of the patients does not make it *any easier to convince one s self of the correct*ness of the view which I have expressed Instead of willingly giving us information concerning their sexual life they try to conceal it by every means in their power Men generally are not candid in sexual matters They do not show their sexuality freely but they wear a thick overcoat —a fabric of lies—to conceal it as though it were bad weather in the world of sex And they

erotic life to his neighbor But when your patients see that in your treatment they may disregard the conventional restraints they lay aside this veil of lies and then only are you in a position to formulate a judgment on the question in dispute Unfortunately physicians are not favoured above the rest of the children of

ness which determines the behavior of most *Kulturmenschen* in affairs of sex

Now to proceed with the communication of our results It is true that in another series of ca es psycho analysis at first traces the symp

ough explanation and complete cure of a case of sickness does not stop in any case with the experience of the time of onset of the disease but in every case it goes back to the adolescence and the early childhood of the patient Here only do we hit upon the impressions and circumstances which *determine the later sickness Only* the childhood experiences can give the explanation for the sensitivity to later traumata and

mother way from an injury to the development of the sex life. The neuroses are related to the perversions as the negative to the positive. In them we find the same impulse-components as in perversions, as bearers of the complexes and as creators of the symptoms, but here they work out from the unconscious. They have undergone a repression, but in spite of this they maintain themselves in the unconscious. Psycho-analysis teaches us that ... strong expression of the impulse in very early life leads to a sort of fixation (*Fixierung*), which then offers a weak point in the articulation of the sexual function. If the exercise of the normal sexual function meets with hindrances in later life, this repression, dating from the time of development, is broken through at just that point at which the infantile fixation took place.

You will now perhaps make the objection: "But all that is not sexuality." I have used the word in a very much wider sense than you are accustomed to understand it. This I willingly concede. But it is a question whether you do not rather use the word in much too narrow a sense when you restrict it to the realm of procreation. You sacrifice by that the understanding of perversions, of the connection between perversion, neurosis, and normal sexual life, and have no means of recognizing in its true significance, the easily observable beginnings of the somatic and mental sexual life of the child. But however you decide about the use of the word, remember that the psycho-analyst understands sexuality in that full sense to which he is led by the evaluation of infantile sexuality.

Now we turn again to the sexual development of the child. We still have much to say here, since we have given more attention to the somatic than to the mental expressions of the sexual life. The primitive object-choice of the child, which is derived from his need of help, demands our further interest. It first attaches to all persons to whom he is accustomed, but soon these give way in favor of his parents. The relation of the child to his parents is, as both direct ... on, he wishes himself in the place of his father, as daughter in the place of the mother. The feelings awakened in these relations between parents and children, and, as a resultant of them, those among the children in relation to each other, are not only positively of a tender ... negatively of an inimical sort. The complex ... much repress... effect ... the ... resents ... and so we are prepared to ... less effectual way in the other fields of mental life. The myth of King Œdipus, who kills his father and wins his mother as a wife is only the slightly altered presentation of the infantile wish, re... by the opposing barriers of incest. ... by the still unrepressed nuclear complex ... begins a very significant part of his mental activity which serves sexual interest. He begins to investigate the question of where children come from and guesses more than adults imagine of the true relations by deduction from the signs ... in this ... ture in him he arrives at a number ... sexual theories, as that the same male genitals belong to both sexes, that children are conceived by eating and born through the opening of the intestine, and that sexual intercourse is to be regarded as an inimical act, a sort of overpowering.

But just the unfinished nature of his sexual constitution and the gaps in his knowledge brought about by the hidden condition of the feminine sexual canal, cause the infant investigator to discontinue his work as a failure. The facts of this childish investigation itself as well as the infantile sex theories created by it are of determinative significance in the building of the child's character, and in the content of his later neuroses.

... normal that the ...

must take them merely as a prototype and transfer from these to other persons in the time of definite object-choice. The breaking loose (*Ablösung*) of the child from his parents is thus

of infantile sexual pleasure is the auto excitation of certain particularly sensitive parts of the body besides the genitals are included the rectum and the opening of the urinary canal and also the skin and other sensory surfaces Since in this first phase of child sexual life the satisfaction is found on the child s own body and has nothing to do with any other object we call this phase after a word coined by Havelock Ellis that of *auto eroticism* The parts of the body significant in giving sexual pleasure we call *erogenous ones* The thumb sucking (*Ludeln*) or passionate sucking (*Wonnesaugen*) of very young children is a good example of such an auto erotic satisfaction of an erogenous zone The first scientific observer of this phenomenon a specialist in children s diseases in Budapest by the name of Lindner interpreted these rightly as sexual satisfaction and described exhaustively their transformation into other and higher forms of sexual gratification[1] Another sexual satisfaction of this time of life is the excitation of the genitals by masturbation which has such a great significance for later life and in the case of many individuals is never fully overcome Besides this and other auto erotic manifestations we see very early in the child the impulse components of *sexual pleasure* or as we may say of the *libido* which presupposes a second person as its object These impulses appear in opposed pairs as active and passive The most important representatives of this group are the pleasure in inflicting pain (sadism) with its passive opposite (masochism) and active and passive exhibition pleasure (*Schaulust*) From the first of these later pairs splits off the curiosity for knowledge as from the latter the impulse toward artistic and theatrical representation Other sexual manifestations of the child can already be regarded from the viewpoint of object choice in which the second person plays the prominent part The significance of this was primarily based upon motives of the impulse of self preservation The difference between the sexes plays however in the child no very great role

[illegible]

ated in which each single impulse goes about the business of arousing pleasure independently of every other is later correlated and organized in two general directions so that by the close of pubert [illegible] he in dividu [illegible] The single [illegible] o the overlordship of the genital zone so that the whole sexual life is taken over into the service of procreation and their gratification is now significant only so far as they help to prepare and promote the true sexual act On the other hand object choice prevails over auto eroticism so that now in the sexual life all components of the sexual impulse are satisfied in the loved person But not all the original impulse components are given a share in the final shaping of the sexual life Even before the advent of puberty certain impulses have undergone the most energetic repression under the impulse of education and mental forces like shame disgust and morality are developed which like sentinels keep the repressed wishes in subjection When there comes in puberty the high tide of sexual desire it finds dams in this creation of reactions and resistances These guide the outflow into the so called normal channels and make it impossible to revivify the impulses which have undergone repression

The most important of these repressed impulses are coprophilism that is the pleasure in children connected with the excrements and further the tendencies attaching themselves to the persons of the primitive object choice

Gentlemen a sentence of general pathology says that every process of development brings with it the germ of pathological dispositions in so far as it may be inhibited delayed or incompletely carried out This holds for the development of the sexual function with its many complications It is not smoothly completed in all individual and may leave behind either abnormalities or disposition to later diseases by the way of later falling back or *regression* It may happen that not all the partial impulses subordinate themselves to the rule of the genital zone Such an impulse which has remained disconnected brings about what we call a perversion which may replace the normal sexual goal by one of its own It may happen as has been said before that the auto eroticism is not fully overcome as many sorts of disturbances testify The originally equal value of both sexes as sexual objects may be maintained and an inclination to homosexual activities in adult life result from this which under suitable conditions rises to the level of exclusive homosexuality This series of disturbances corresponds to the direct inhibition of development of the sexual function it includes the perversions and the general *infantilism* of the sex life that are not seldom met with

The disposition to neuroses is to be derived in

[1] *Jah b ch f K nde l lk nde* 879

Jung has expressed neurotics fall ill of the same complexes with which we sound people struggle. It depends on quantitative relationships, on the relations of the forces wrestling with each other whether the struggle leads to health, to neurosis or to compensatory over functioning (*Überleistung*)

Ladies and gentlemen I have still withheld most remarkable experience which

e

ours in him the so-called ... s fer (*Übertragung*) that is, he applies to the person of the physician great amount of tender emotion, often mixed with enmity which has no foundation in any real relation and must be derived in every respect from the old wish fancies of the patient, which have become unconscious. Every fragment of his emotive life which can ... reco d-

existence and the power of these ... s sexual excitations The symptoms which to use a simile from chemistry are the precipitates of earlier love experiences (in the widest sense) can only be dissolved in the higher temperature of the experience of transfer and transformed into other psychic products The physician plays in this reaction to use an excellent expression of S Ferenczi the rôle of a *catalytic ferment* which temporarily attracts to itself the affection which has become free in the course of the process

The study of transfer can also give you the key to the understanding of hypnotic suggestion, which we at first used with our patients as technical means of investigation of the unconscious Hypnosis showed itself at that time to be therapeutic help but a hindrance to the scientific knowledge of the real nature of the case since it cleared away the psychic resistances ...

arises spontaneously in all human relations and in the relations of the patient to the physician It is everywhere the especial bearer of therapeutic influences and the ... ks the ... stronger th

less one knows of its presence. Accordingly psycho-analysis does not create it, it merely discloses it to consciousness and avails itself of it in order to direct the psychic processes to the ... I But I cannot leave the theme of

e

I

know that all my audience ... d of the correctness of my views through their experience with transfer and I can very well conceive that one may not win such a surety of judgment so long as he makes no psycho-analysis, and so has not himself observed the effects of transfer

Ladies and gentlemen I am of the opinion that there are on the intellectual side two hindrances to acknowledging the value of the psycho-analytic viewpoint first the fact that we are not accustomed to reckon with a strict de ... without

mental processes ... s ... ones with which we are familiar One of the most widespread resistances against the work of psycho-analysis with patients as with persons in health reduces to the latter of the two moments. One is afraid of doing harm by psycho-analysis, one is anxious about calling up into consciousness the repressed sexual impulses of the patient as though there were danger that they could overpower the higher ethical strivings and rob him of his cultural acquisitions. One can see

Of course, better not to touch diseased places when one can only cause pain But we know that the surgeon does not refrain from the investigation and examination of the seat of illness if his intervention has as its aim the restoration of lasting health Nobody thinks of blaming him for the unavoidable difficulties of the investigation or the phenomena of reaction from the operation if these only accomplish their purpose and gain for the patient final cure by temporarily making his condition worse The case is similar in psycho-analysis It can lay claim to the same things as surgery the increase of pain which takes place in the patient during the treatment is very much less than that which the ur ...

S Ferenczi, Introjektion und Übertragung, Jahrbuch f Psychoanal. u. Psychopath. Forschungen, Vol. I, No. ... 09

a problem impossible to escape if the social virtue of the young individual is not to be impaired During the time that the repressive activity is making its choice among the partial sexual impulses and later when the influence of the parents which in the most essential way has furnished the material for these repressions is lessened great problems fall to the work of education which at present certainly does not always solve them in the most intelligent and economic way

Gentlemen do not think that with these explanations of the sexual life and the sexual development of the child we have too far departed from psycho analysis and the cure of neurotic disturbances If you like you may regard the psycho analytic treatment only as a continued education for the overcoming of childhood remnants (*Kindheitsresten*)

FIFTH LECTURE

LADIES AND GENTLEMEN With the discovery of infantile sexuality and the tracing back of the neurotic symptoms to erotic impulse components we have arrived at several unexpected formulae for expressing the nature and tendencies of neurotic diseases We see that the individual falls ill when in consequence of outer hindrances or inner lack of adaptability the satisfaction of the erotic needs in the sphere of reality is denied We see that he then flees to sickness in order to find with its help a surrogate satisfaction for that denied him We recognize that the symptoms of illness contain fractions of the sexual activity of the individual or his whole sexual life and we find in the turning away from reality the chief tendency and also the chief injury of the sickness We may guess that the resistance of our patients against the cure is not a simple one but is composed of many motives Not only does the ego of the patient strive against the giving up of the repression by which it has changed itself from its original constitution into its present form but also the sexual *impulses may not renounce their surrogate satis*faction so long as it is not certain that they can be offered anything better in the sphere of reality

The flight from the unsatisfying reality into

tient takes place over the path of regression the return to earlier phases of the sexual life when satisfaction was not lacking This regression is seemingly a twofold one a *temporal* in so far as the *libido* or erotic need falls back to a temporally earlier stage of development and a *formal* since the original and primitive psychic means of expression are applied to the expression of this need Both sorts of regression focus in childhood and have their common point in the production of an infantile condition of sexual life

The deeper you penetrate into the pathogenic of neurotic diseases the more the connexion of *neuroses with other products of human mentality* even the most valuable will be revealed to you You will be reminded that we men with the high claims of our civilization and under the pressure of our repressions find reality generally quite unsatisfactory and so keep up a life of fancy in which we love to compensate for what is lacking in the sphere of reality by the production of wish fulfilments In these phantasies is often contained very much of the particular constitutional essence of personality and of its tendencies repressed in real life The energetic and successful man is he who succeeds by dint of labour in transforming his wish fancies into reality Where this is not successful in consequence of the resistance of the outer world and the weakness of the individual there begins the turning away from reality The individual takes refuge in his satisfying world of fancy Under certain favourable conditions it still remains possible for him to find another connecting link between these fancies and reality instead of permanently becoming a stranger to it through the regression into the infantile If the individual who is displeased with reality is in possession of that *artistic talent* which is still a psychological riddle he can transform his fancies into artistic creations So he escapes the fate of a neurosis and wins back his connection with reality by this roundabout way Where this opposition to the real world exists but this valuable talent fails or proves insufficient it is unavoidable that the *libido* following the origin of the fancies succeeds by means of regression in revivifying the infantile wishes and so producing a neurosis The neurosis takes in our time the place of the cloister in which were accustomed to take ref

rived by the psycho analytic investigation of neurotics namely that neuro es have no peculiar psychic content of their own which is not also to be found in healthy states or as C G

u l P ych l g 56 pp H ll & C V n 9 7

Selected Papers on Hysteria

impulse which has been freed from repression is wholly impossible *In relation to this anxiety* we must consider what our experiences have taught us with certainty that the somatic and mental power of a wish if once its repression has not succeeded is incomparably stronger when it is unconscious than when it is con scious so that by being made conscious it can only be weakened The unconscious wish cannot be influenced is free from all strivings in the contrary direction while the conscious is inhibited by those wishes which *are also con* scious and which strive against it The work of psycho analysis accordingly presents a better substitute in the service of the highest and most valuable cultural strivings for the repression which has failed

Now what is the fate of the wishes which have become free by psycho analysis by what means shall they be made harmless for the life of the individual? There are several ways The general consequence is that the wish is consumed during the work by the correct mental activity of those

posal This is possible since for the most part we have to abolish only the effects of earlier de velopmental stages of the ego The individual for his part only repressed the useless impulse because at that time he was himself still incom pletely organized and weak in his present ma turity and strength he can perhaps conquer without injury to himself that which is inimical to him A second issue of the work of psycho analysis may be that the revealed unconscious impulses can now arrive at those useful applica tions which in the case of undisturbed develop ment they would have found earlier The extir pation of the infantile wishes is not at all the ideal aim of development The neurotic has lost by his repressions many sources of mental en ergy whose contingents would have been very valuable for his character building and his life activities We know a far more purposive proc ess of development the so called ***sublimation*** ***(Sublimirung)*** by which the energy of infantile wish excitations is not secluded but remains capable of application while for the particular excitations instead of becoming useless a high er eventually no longer sexual goal is set up The components of the sexual instinct are es pecially *distinguished* by such a capacity for the sublimation and exchange of their sexual goal for one more remote and socially more valuable To the contributions of the energy won in such a way for the functions of our mental life we *probably owe the highest cultural* consequences A repression taking place at an early period ex cludes the sublimation of the repressed impulse after the *removal of the repression the way to* sublimation is again free.

We must not neglect also to glance t the third of the possible issues A certain part of the suppressed libidinous excitation has a right to direct satisfaction and ought to find it in life The claims of our civilization make life too hard *for the greater part of humanity and so further* the aversion to reality and the origin of neuro ses without producing an excess of cultural gain by this excess of sexual repression We ought not to go so far as to fully neglect the original animal part of our nature we ought not to for get that the happiness of individuals cannot be dispensed with as one of the aims of our culture The plasticity of the sexual components mani fest in their capacity for sublimation may cause *a great temptation to accomplish greater* cul ture effects by a more and more far reaching sublimation But just as little as with our ma chines we expect to change more than a certain fraction of the applied heat into useful mechani cal work just as little ought we to strive to sep arate the sexual impulse in its whole extent of energy from its peculiar goal This cannot suc ceed and if the narrowing of sexuality is pushed too far it will have all the evil effects of a rob bery

I do not know whether you will regard the ex hortation with which I close as a presumptuous one I only venture the indirect presentation of my conviction if I relate an old tale whose ap plication you may make yourselves German lit erature knows a town called *Schilda* to whose inhabitants were attributed all sorts of clever pranks The wiseacres so the story goes had a horse with whose powers of work they were well satisfied and against whom they had only one grudge that he consumed so much expen

day until he had learned to do without them al together Things went finely for a while the

not understand why he had died We should be inclined to believe that the horse had starved and that without a certain ration of oats no work could be expected from an animal

CHAPTER I

The Psychic Mechanism of Hysterical Phenomena (Preliminary Communication)

Acte ted by a umbe of cidental observa tions, we have investigated over a period of years the different forms and symptoms of hysteria for the purpose of disco ering the cause and th process which first pro oked the phenomena in question and which in great many of our cases frequently ppeared years before. In the great majority of cases we did not succeed in el cidating this starting point from the mere history no matter how detailed it might have been partly because we had to deal with experiences about which discus on was disagreeable to th patie ts but mainly because they really could not recall anything Often they had no inkling of the causal connecti n between the traumatic process and th pathological phenomenon. It was generally necessary to hypnotize the patients and reawaken the memory of the time in which the ymptom first appeared but we thus succeeded in xposing that connec tion in a most precise and c ncing manner

This method f *examination in a great num*ber of cases has furnished us with results which seem t be f theoretical as well as of practical value.

It is f *theoretical value* because t has shown us that in the d termination of the path logy of h st ria, the accidental fact plays a m ch great part than is generally known and cog nized. It is quite ev dent that in *tr m t c* hysteria it is the accident which evokes the syn dr me. M reove in hyst rical crises if the pa tients ate that in each attack they hall cinate the sam process which ev ked the first ttack, here too th ausal connect on eems quite c ear B t the u iati n is more bscure in the other phen mena.

Our experiences have shown us *that th most v d symp oms which pass as s on aneous or as wer as idiopathic attainments f hysteria t nd t just as ringent connec ion with the causal t auma as th transparent phenomena mentioned* To such causal factors we are able to refer neuralgias as well as the different kind of anesthesias often of years duration contrac tures and paralyses hysterical attacks and epi leptif rm con ulsions which every ob erver has taken for real epileps *petit mal* and the like af fections persistent vomiting and anorexia even up to the refusal of nourishment all kinds of v recurring usual

the traumatic neurosis. Very oft n th a e periences of childhood which ha e establi hed m re o *less intensi e morbid* phenomena for all ucceeding years

Th connecti n is often so clear that it is per fectly manifest how the causal event produced just this and no othe phenomenon It is quite clearly determined by the cause. Thus l t us take the most banal example if a painful af fect originates while eating and is repressed it m y produce na sea and vomiting and then co inue f r months as an hysterical symptom. Th f llowing examples will illustra e what we mean

A very distressed young girl, while anxiously watching at s ck bed, fell into a dream tate had t rrifying hallucinations and he right arm which was at the time hangi o er the back of the chair became numb This resulted in a pa ral s co tracture and anaesthesia of that arm. She wanted to pra but c uld find n words but finally ucceeded in uttering an English childre s praye Lat r on deve oping a very gra e and most complicated hysteria he spoke wrot and understood only English whe eas her native to gu was in omprehen ble to her f a ear and half

A ery k h ld fi ally fell a leep The m her exerted all her will power t make no no se t awaken it, but because h resol ed to do be em tted a clickin sound with her to gue (h ste ical counte w ll) Th w s la er repeated on a oth cas on when she wi hed to be bsol ly qu and developed in t a t c wh h in th form of t ngue clicking accompanied every excitement for years.

W tten in collabora w th Joseph Breuer Vorle ke Zentr l tt s 3 Nos. and later published in Studien über Hysterie 895

in some way even after years, not indirectly by means of a chain of causal links but directly as provoking cause, just perhaps as in the wakeful consciousness where the memory of a psychic pain may later call forth tears. In other words: *The hysteric suffers mostly from reminiscences.*

II

It would seem at first rather strange that long forgotten experiences should exert so intensive an influence, and that their recollection should not be subject to the decay into which all our memories sink. We will perhaps gain some understanding of these facts by the following examinations.

The blurring or loss of an affect of memory depends on a great many factors. In the first place it is of great consequence whether there was an energetic reaction to the affectful experience or not. By reaction we here understand a whole series of voluntary or involuntary reflexes ranging from crying to an act of revenge, through which, according to experience, affects are discharged. If the success of this reaction is of sufficient strength, it results in the disappearance of a great part of the affect. Language attests this fact of daily observation in such expressions as "to give vent to one's feeling," to be "relieved by weeping," etc. If the reaction is suppressed, the affect remains united with the memory. An insult retaliated, be it only in words, is differently recalled than one that had to be taken in silence. Language also recognizes this distinction between the psychic and physical results, and designates most characteristically the silently endured suffering as *grievance*. The reaction of an injured person to a trauma has really only then a perfect cathartic effect if it is expressed in an adequate reaction like revenge. But man finds a substitute for this action in speech through which help the affect can well nigh be ab-reacted ("abreagirt"). In other cases, talking in the form of deploring and giving vent to the torments of the secret (confession) is in itself an adequate reflex. If such reaction does not result through deeds, words, or in the most elementary case through weeping, the memory of the occurrence retains above all an affective accentuation.

The ab-reaction, however, is not the only form of discharge at the disposal of the normal psychic mechanism of the healthy person who has experienced a psychic trauma. The memory of the trauma, even where it has not been ab-reacted, enters into the great complex of the associations. It joins the other experiences which [illegible]

[illegible] ger and [illegible] is accompanied by the recollection of the further course, the rescue and the consciousness of present security. The memory of a grievance may be corrected by a rectification of the state of affairs, by reflecting upon one's own dignity and similar things. A normal person is in this way capable of dissipating the accompanying affect by means of association.

In addition, there appears that general blurring of impressions, that fading of memories which we call *forgetting* and which above all wears out the affective ideas no longer active.

It follows from our observations that those memories which become the causes of hysterical phenomena have been preserved for a long time with wonderful freshness and with their perfect emotional tone. As a further striking and a later realizable fact, we have to mention that the patients do not perhaps have the same control of these as of their other memories of life. On the contrary *these experiences are either completely lacking from the memory of the patient in their usual psychic state or are present in greatly abridged form*. Only after the patients are questioned in the hypnotic state do these memories appear with the undiminished vividness of fresh occurrences.

Thus one of our patients in a hypnotic state reproduced with hallucinatory vividness throughout half a year everything that excited her during an acute hysteria on the same days of the preceding year. Her mother's diary which was unknown to the patient proved the faultless accuracy of the reproductions. Partly in hypnosis and partly in spontaneous attacks, another patient lived through with hallucinatory distinctness all experiences of a hysterical psychosis which she went through ten years be-

We are unable to distinguish in this preliminary communication what there is new in this concept, and what can be found in such other authors as Moebius and Strümpell, who present similar views on hysteria. The greatest similarity to our theoretic and therapeutic accomplishments we accidentally found in some published observations of Benedikt, which we shall discuss later on.

The German "abreagiren" has no exact English equivalent. It will therefore be rendered throughout the text by ab-react. The literal meaning is [illegible] or to act off. It is the act of giving vent in speech and action to repressed experiences, and thereby discharging [illegible]. It has different shades of meaning, from [illegible], which can be discerned from the context.—T.

A very intelligent man was present while his brother was anaesthetized and his ankylosed hip stretched At the moment when the joint yielded and crackled he perceived severe pain in his own hip which continued for almost a year

In other cases the connection is not so simple there being only as it were a symbolic relation between the cause and the patholo ical phenomenon just as in the normal dream Thus psychic pain may result in neuralgia or the affect of moral di gust may cause vomiting We have studied patients who were wont to make the most prolific use of such symbolization In still other cases such a determination is at first sight incomprehensible yet in this group we find the typical hysterical symptoms such as hemianaesthesia contraction of the visual field epileptiform convulsions and similar symptoms The explanation of our views concerning this group must be deferred for a more detailed discussion of the subject

Such observations seem to demonstrate the pathogenic analogy between simple hysteria and traumatic neurosis and justify a broader conception of traumatic hysteria The active aetiological factor in traumatic neurosis is really not the insignificant bodily injury but the affect of the fright that is the *psychic trauma* In an analogous manner our investigations show that the causes of many if not of all cases of hysteria can be designated as psychic traumas Every experience which produces the painful affect of fear anxiety shame or of psychic pain may act as a trauma Whether an experience becomes of traumatic importance naturally depends on the person affected as well as on the condition which will be mentioned later In ordinary hysterias we frequently find instead of one large trauma many partial traumas grouped causes which can be of traumatic significance only when summarized and which belong together insofar as they form small frag

after its penetration must be considered as an agent of the present the proof of which we see in a most remarkable phenomenon which at the same time adds to our discoveries a distinctly practical interest

We found at first to our greatest surpri e that the *individual hysterical symptoms immediately disappeared without returning if we succeeded in thoroughly awakening the memories of the causal process with its accompanying affect and if the patient circumstantially discussed the process in the most detailed manner and gave verbal expression to the affect* Recollections without affects are almost utterly useless The psychic process which originally elapsed must be reproduced as vividly as possible so as to bring it back into the *statum nascendi* and then thoroughly talked out If it concerns such irritating manifestations as convulsions neuralgias and hallucinations they are once more brought to the surface with their full intensity and they then vanish forever Functional attacks like paralyses and anaesthesias likewise disappear but naturally without any appreciable distinctness of their momentary aggravation

It would be quite reasonable to suspect that one deals here with an unintentional suggestion. The patient expects to be relieved of his suffering and it is this expectation and not the discussion that is the effectual factor But this is not so The first observation of this kind in which a most complicated case of hysteria was analysed and the individual causal symptoms separately abrogated occurred *in the year* 1881 that is in a *pre suggestive* period It was brought about through a spontaneous auto hypnosis of the patient and caused the examiner the greatest surprise

In reversing the sentence *cessante causa cessat effectus* we may conclude from this observation that the causal process continues to act

eemingly indifferent situations to traumatic dignity which they would not have attained otherwise but which they retain ever after

But the causal connexion of the causative psychic trauma with the hysterical phenomena does not mean that the trauma as an *agent provocateur* would release the symptom which would then become independent and continue as such On the contrary we must maintain that the psychic trauma of the memory of the same acts like a foreign body which even long

esses, as do the various states of hypnosis which range from light somnolence to somnambulism, and from perfect memory to absolute amnesia.

If such hypnoid states have already existed before the manifest disease they prepare the soil upon which the affect establishes the pathogenic memories with their resulting somatic manifestations. This behavior corresponds to hysteria, based on a predisposition. But our observations show that a severe trauma (like a traumatic neurosis) or a severe suppression (perhaps of sexual affect) may bring about a splitting of ideas even in persons without predispositions. This represents the mechanism of the psychically acquired hysteria. Between these two extremes we have a series in which the facility of dissociation in a particular individual and the magnitude of the affective trauma vary inversely.

We are unable to say anything new as to the determination of the predisposed hypnoid states. We presume that they often develop from reveries which are so frequent even in normal persons, for which, for example, feminine handwork offers so much opportunity. The questions why "the pathological associations formed in such states are so firm, and why they exert a stronger influence on the somatic processes than other ideas, are all indissolubly linked with the problem of the effectiveness of hypnotic suggestions in general. Our experiences in this matter do not show us any thing new. But they rather throw light on the contradiction between the statement, "Hysteria is a psychosis," and the fact that among hysterics one may meet persons of the clearest intellects, the strongest wills, greatest principles and of the subtlest minds. In these cases such characteristics hold true only in the person's waking thought; in his hypnotic state he is alienated just as we all are in our dreams. Yet whereas our dream psychoses do not influence our waking state, the products of hypnotic states are projected into the waking state as hysterical phenomena.

IV

Almost the same assertions that we have advanced about hysterical symptoms we may also repeat concerning hysterical attacks. As is known, we have Charcot's schematic description of the major hysterical attack, which in complete form shows four phases: (1) The epileptoid, (2) the major movements, (3) the *attitudes passionelles* (hallucinatory phase) and (4) the concluding delirium. By shortening or prolonging the attack, and by isolating the individual phases Charcot obtained all those forms of the hysterical attack which are really observed more frequently than the complete *grande attaque*.

Our tentative explanation refers to the third phase, the *attitudes passionelles*. Wherever it is prominent it contains the hallucinatory reproduction of a memory which was significant for the hysterical onset. It is the memory of a major trauma, the κατ' ἐξοχήν of the so-called traumatic hysteria, or of a series of partial traumas belonging together as they are found at the basis of the ordinary hysteria. Or finally the attack may bring back those occurrences which, because of their encounter with a factor of a special predisposition, have become raised to traumas.

But there are also other attacks which ostensibly consist only of motor phenomena and lack the *passionelle* phase. If it is possible during such an attack of general twitching, cataleptic rigidity or an *attaque de sommeil* to put oneself *en rapport* with the patient, or still better if one succeeds in evoking the attack in a hypnotic state, it will then be found that here too the root of it is the memory of a psychic trauma, or of a series of traumas which make themselves otherwise prominent in an hallucinatory phase. Thus a little girl had suffered for years from attacks of general convulsions, which could be and were taken for epilepsy. For differential diagnostic reasons she was hypnotized and she immediately lapsed into one of her attacks. On being asked what she saw she said, "The dog, the dog is coming," and it actually turned out that the first attack of this kind appeared after she was pursued by a mad dog. The success of the therapy then verified our diagnostic decision.

An official who became hysterical as a result of ill treatment by his employer suffered from attacks during which he fell to the floor raging furiously without uttering a word or displaying any hallucination. The attack was provoked in a state of hypnosis and he then stated that he lived through the scene during which his employer insulted him in the street and struck him with his cane. A few days later he came to me complaining that he had the same attack, but was shown in the hypnosis this time that he went through the scene which was really connected with the onset of his disease; it was the scene in the court room, when he was unable to

fore and for the greatest part of which she had been amnesic until its reappearance Also some individual memories of aetiological importance showed surprising integrity and sentient force of fifteen to twenty five years duration and on their return exerted the full affective force of new experiences

The reason for this we can seek only in the fact that these memories occupy an exceptional position in all the above mentioned relations as far as vividness is concerned For it *was really shown that these memories correspond to traumas which were not sufficiently ab reacted* and on closer investigation of the reasons for this hindrance we can find at least two series of determinants throu h which the reaction to the trauma was omitted

To the first group we add those cases in which the patient had not reacted to psychic traumas because the nature of the trauma precluded a reaction or because social relations made the reaction impossible or because it concerned things which the patient wished to forget and which he therefore intentionally inhibited and repressed from his conscious memory It is just such painful things which are found in the hypnotic state as the basis of hysterical phenomena (hysterical delirium of saints nuns abstinent women and well bred children)

The second series of determinants is not conditioned by the content of the memories but by the psychic states with which the corre ponding experiences in the patient have united As a cause of hysterical symptoms one finds in hypnosis even ideas which are insignificant in themselves but which owe their preservation to the fact that they originated during a evere paralyzing affect like fright or directly in abnormal psychic conditions as in the semi hypnotic twilight states of day dreaming in auto hypnosis and similar states Here it is the nature of these conditions which makes a reaction to the incident impossible

To be sure both determinants can naturally unite and as a matter of fact they often do This is the case when a trauma in itself effectual occurs in a state of a severely paralyzing affect or from a transformed consciousness But it may also happen that the psychic trauma evokes in many persons one of these abnormal states which in turn makes the reaction impossible

What is common to both groups of determinants is the fact that those psychic traumas which are not adjusted by reaction are also prevented from adju tment by associative elaboration In the first group it is the resolution of the patient which strives to forget the painful experiences and in this way if possible to exclude them from association in the second group the associative elaboration does not uc ceed because between the normal and pathological state of consciousness in which these ideas originated there is no productive associative relationship We shall soon have occasion to discuss more fully these relationships

Hence we can ay *that the reason why the pathogenically formed ideas retain their freshness and affective force is because they are not subject to the normal fading through ab reaction and through reproduction in states of uninhibited association*

III

When we discussed the conditions which according to our experience are decisive in the development of hysterical phenomena from psychic traumas we were forced to peak of abnormal states of consciousness in which such pathogenic ideas originate and we had to emphasize the fact that the recollection of the effectual psychic trauma is not to be found in the normal memory of the patient but in the hypnotized memory The more we occupied ourselves with these phenomena the more certain became our convictions *that the splitting of consciousness so striking in the familiar classical cases of double consciousness exists rudimentarily in every hysteria and that the tendency to this dissociation and with it the appearance of abnormal states of consciousness which we comprise as* hypnoid *is the basic phenomenon of this neurosis* In this view we agree *with Binet and Janet though we had no experi*ence with their remarkable findings in anaethetic patients

Hence to the often cited axiom 'Hypnosis is artificial hysteria we should like to add another The existence of hypnoid states is the basis and determination of hysteria The e hypnoid states agree *in all their diversities* among them elves and with hypnosis in the one point namely that the ideas arising in them are very intensive but are excluded from associative relations with the rest of the content of consciousness These hypnoid states are as ociable amon themselves and their ideation may thus attain various high degrees of psychic organization In other respects the nature of the e tates and the degree of their exclusiveness differ from the rest of the conscious proc

esses as d the various states of hypnosis, which range from light somnolence to somnam b lism and from pe fect memory to absolute amnesia.

If uch hypno d states have already existed before the manifest d ease they prepare the soil upon whi h the ffect establ shes the pathogenic memories w th the r resulting somatic manifestat ons This beha ior corresponds to hysteria, based on a pred spos tion But our observa ons show that a severe trauma (like a traum tic neurosis) or a severe uppres on (perhaps of a sexual affect) may bring about a spli ting of ideas even in persons without predispositions Th s represents th mechanism of the psy hically acquired hysteria Between these two extremes we ha e a series in which the fa cility of dissociation in a particul r ind v dual and the magnitude of the aff cti e trauma vary in ersely

III

When we discussed the conditions which according to our experience are decisive in the development of hysterical phenomena from psychic traumas we were forced to peak of abnormal states of consciousness in which such patho enic ideas originate and we had to emphasize the fact that the recollection of the effectual psychic trauma is not to be found in the normal memory of the patient but in the hypnotized memory The more we occupied ourselves with these phenomena the more certain became our convictions *that the splitting of consciousness so striking in the familiar classical cases of double consciousness exists rudimentarily in every hysteria and that the tendency to this dissociation and with it the appearance of abnormal states of consciousness which we comprise as* hypnoid *is the basic phenomenon of this neurosis* In this view we agree with Binet and Janet though we had no experience with their remarkable findings in anaesthetic patients

Hence to the often cited axiom Hypnosis is artificial hysteria we should like to add another The existence of hypnoid states is the basis and determination of hysteria The e hypnoid states agree in all their diversities among themselves and with hypnosis in the one point namely that the ideas arising in them are very intensive but are excluded from associative relations with the rest of the content of consciousness These hypnoid states are as ociable amon themselves and their ideation may thus attain various high degrees of psychic organization In other respects the nature of these states and the degree of their exclusiveness differ from the rest of the conscious proc

esses as do the various states of hypnosis which range from light somnolence to somnambulism, and from perfect memory to absolute amnesia.

If such hypnoid states have already existed before the manifest disease they prepare the soil upon which the affect establishes the pathogenic memories with their resulting somatic manifestations. This behavior corresponds to hysteria based on a predisposition. But our observations show that a severe trauma (like a traumatic neurosis) or a severe suppression (perhaps of a sexual affect) may bring about a splitting of ideas even in persons without predispositions. This represents the mechanism of the psychically acquired hysteria. Between these two extremes we have a series in which the facility of dissociation in a particular individual and the magnitude of the affective trauma vary inversely.

We are unable to say anything new as to the determination of the predisposed hypnoid states. We presume that they often develop from "reveries" which are so frequent even in normal persons, for which, for example, feminine handwork offers so much opportunity. The questions why "the pathological associations" formed in such states are so firm, and why they exert a stronger influence on the somatic processes than other ideas, are all indissolubly linked with the problem of the effectiveness of hypnotic suggestions in general. Our experiences in this matter do not show us anything new but they rather throw light on the contradiction between the statement "Hysteria is a psychosis" and the fact that among hysterics one may meet persons of the clearest intellects, the strongest wills, greatest principles and of the subtlest minds. In these cases such characteristics hold true only in the person's waking thought; in his hypnotic state he is alienated just as we all are in our dreams. But, whereas our dream psychoses do not influence our waking state, the products of hypnotic states are projected into the waking state as hysterical phenomena.

IV

Almost the same assertions that we have advanced about hysterical symptoms we may also repeat concerning hysterical attacks. As is known we have Charcot's schematic description of the *major* hysterical attack which in complete form shows four phases: (1) The epileptoid, (2) the major movements, (3) the *attitudes passionelles* (hallucinatory phase) and (4) the concluding delirium. By shortening or prolonging the attack, and by isolating the individual phases Charcot obtained all those forms of the hysterical attack, which are really observed more frequently than the complete *grande attaque*.

Our tentative explanation refers to the third phase the *attitudes passionelles*. Wherever it is h ll el ators repro-

jor trauma the x ‘ox+ oi the ma d traumatic hysteria or of a series of partial traumas belonging together as they are found at the basis of the ordinary hysteria. Or finally the attack may bring back those occurrences which, because of their encounter with a factor of a special predisposition have become raised to traumas.

But there are also other attacks which ostensibly consist only of motor phenomena and lack the *passionelle* phase. If it is possible during such an attack of general twitching, cataleptic rigidity or an *attaque de sommeil* to put one's *self en rapport* with the patient, or still better if one succeeds in evoking the attack in a hypnotic state, it will then be found that here too the root of it is the memory of a psychic trauma or of a series of traumas which make themselves otherwise prominent in an hallucinatory phase. Thus a little girl had suffered for years from attacks of general convulsions which could be and were taken for epilepsy. For differential diagnostic reasons she was hypnotized and she immediately lapsed into one of her attacks. On being asked what she saw she said, "The dog, the dog is coming", and it actually turned out that the first attack of this kind appeared after she was pursued by a wild dog. The success of the therapy then verified our diagnostic decision.

An official who became hysterical as a result of ill treatment by his employer suffered from attacks during which he fell to the floor raging furiously without uttering a word or displaying any hallucination. The attack was provoked in a state of hypnosis and he then stated that he lived through the scene during which his employer insulted him in the street and struck him with his cane. A few days later he came to me complaining that he had the same attack, but it was shown in the hypnosis this time that he went through the scene which was really connected with the onset of his disease. It was the scene in the court room when he was unable to

get satisfaction for the ill treatment which he received etc

The memories which appear in hysterical attacks or which can be awakened in them correspond in all other respects to the causes which we have found as the basis of *continuous hysterical symptoms* Like these they refer to psychic traumas which were prevented from adjustment through ab reaction or through associative elaboration like these they were absent entirely or in their essential components in the total memory of normal consciousness and showed themselves as parts of the ideation content of hypnoid states of consciousness with restricted associations Finally they were also amenable to the therapeutic test Our observations have often taught us that a memory which has hitherto provoked attacks becomes incapable of it when it is brought to reaction and associative correction in a hypnotic state

The motor phenomena of the hysterical attack can *in part be interpreted as the memory* of general forms of reaction of the accompanying affect (like the fidgeting of the whole body to which the infant already resorts) in part as a direct motor expression of this memory and in other parts they like the hysterical stigmata in the permanent symptoms elude this explanation

A special estimation of the hysterical attack is obtained if one also takes into account the fact that in hysteria there are groups of ideas *which originated in hypnoid states which are* excluded from associative activity with the rest but are associable among themselves and thus represent a more or less highly organized rudimentary second consciousness a *condition seconde* A persistent hysterical symptom therefore corresponds to an impingement of this second state upon a bodily innervation otherwise controlled by the normal consciousness But an hysterical attack gives evidence of a higher organization of this second state and if *of recent origin signifies a moment in which* this hypnoid consciousness has gained control of the whole existence that is we have an acute hysteria but if it is a recurrent attack containing a memory we simply have a repetition of the same Charcot has already given utterance to the thought that the hysterical attack must be the rudiment of a *condition seconde* During the attack the control of the whole bodily innervation passes over to the hypnoid consciousness As familiar experiences show the normal consciousness is not always entirely repressed by it it may even perceive the motor phenomenon of the attack while the psychic processes of the same escape all knowledge of it

The typical course of a grave hysteria as is well known is as follows At first an ideation is *formed in the hypnoid state* which after sufficient growth gains control in a period of *acute hysteria* of the bodily innervation and the existence of the patient and creates permanent symptoms and attacks and with the exception of some residuum then ends in recovery If the normal personality can regain the upper hand all that has survived the hypnoid ideation content then returns in hysterical attacks and now and then it brings the person back into similar states which are again amenable to influences and eligible for traumas Frequently a sort of equilibrium is then established between the psychic groups which are united in the same person attack and normal life go hand in hand without influencing each other The attack *then comes spontaneously just as memories are* wont to come but just like memories it can also be provoked by the laws of association The provocation of the attack results either through stimulating a hysterogenic zone or through a new experience which by similarity recalls the pathogenic experience We hope to be able to show that there is no essential difference between the apparently two diverse determinants and that in both cases a hyperæsthetic memory is touched In other cases this equi*librium shows a marked lability the attack ap*pears as a manifestation of the hypnoidal remnant of consciousness as often as the normal person becomes exhausted and functionally incapacitated We cannot disregard the fact that in such cases the attack becomes stripped of its original significance and may return as a contentless motor reaction

It remains a task for future investigation to discover what conditions are decisive in determining whether an hysterical individuality *should manifest itself in* attacks in persistent symptoms or in a mingling of both

V

We can now understand in what manner the psycho therapeutic method propounded by us exerts its curative effect *It abrogates the efficacy of the original non-ab reacted ideas by affording an outlet to their strangulated affects through speech It brings them to associative correction by drawing them into normal consciousness (in mild hypnosis) or by eliminating them through medical suggestion in the same*

... as ... hallucinations of hysteria.

We maintain that the therapeutic gain obtained by applying this process is quite considerable. To be sure, we do not cure the hysteria so far as it represents a predisposition, for we surely do not block the way for the recurrence of hypnoid states. Nor is our procedure capable of preventing the replacement of the laboriously abrogated phenomena by new ones. But once this acute stage has run its course and its remnants continue as permanent hysterical symptoms and attacks, our radical method can frequently remove them forever, and herein it seems to surpass the efficacy of direct suggestion, as practised at present by psycho-therapists.

In thus disclosing the psychic mechanisms of hysterical phenomena, we have taken a step forward on the path so successfully started by Charcot with his explanation and experimental imitation of hystero-traumatic paralyses, we are well aware that in so doing we have only advanced our knowledge in the mechanisms of hysterical symptoms and not in the subjective causes of hysteria. We have grazed only the aetiology of hysteria, and can only throw light on the causes of the acquired forms, i.e. on the significance of the accidental factors of the process.

CHAPTER 2

CASE HISTORY OF MISS LUCY R.

Towards the end of 1892 a friendly colleague recommended to me a young lady whom he had been treating for chronic recurrent purulent rhinitis. It was later found that the obstinacy of her trouble was caused by a caries of the ethmoid. She finally complained of new symptoms which this experienced physician could no longer refer to local affections. She had lost all perception of smell and was almost constantly bothered by one or two subjective sensations of smell. This she found very irksome. In addition to this she was depressed in spirits, weak, and complained of a heavy head, loss of appetite, and an incapacity for work.

This young lady visited me from time to time during my office hours—she was governess in the family of a factory superintendent living in the suburbs of Vienna. She was an English lady of rather delicate constitution, anemic, and, with the exception of her nasal trouble, was in good health. Her first statements concerned with those of her physician.

Breuer & Freud, Studies on Hysteria (1895) Case III.

She suffered from mild depression and lassitude and was tormented by subjective sensations of smell. Of hysterical signs, she showed a quite distinct general analgesia without tactile impairment, the fields of vision showed no narrowing on coarse testing with the hand. The nasal mucous membrane was totally analgesic and reflexless. Tactile sensation was absent, and the perception of this sense organ was abolished for specific as well as for other stimuli, such as ammonia or acetic acid. The purulent nasal catarrh was just then in a period of improvement.

On first attempting to understand this case we felt the subjective sensations of smell must represent recurrent hallucinations interpreting persistent hysterical symptoms that the mild depression was perhaps the affect belonging to the trauma, and that there must have been an episode during which the present subjective sensations were objective. This episode must have been the trauma, the symbols of which recurred in her memory as sensations of smell. Perhaps it would have been more correct to consider the recurring hallucinations of smell with the accompanying depression as equivalents of hysterical attacks. For the nature of recurrent hallucinations really makes them unsuitable for the role of chronic symptoms, which was hardly the question in this rudimentary case. But it was absolutely necessary that the subjective sensations of smell should show a specialization that could correspond to a very definite and real objective origin.

This expectation was soon fulfilled, for on being asked what odour troubled her most she stated that it was an odour of burned pastry. I could then assume that the odour of burned pastry really occurred in the traumatic event. It is quite unusual to select sensations of smell as memory symbols of traumas but it is quite obvious why these were here selected. She was afflicted with purulent rhinitis, hence the nose and its perception were in the foreground of her attention. All I knew about the life of the patient was that she took care of two children whose mother died a few years ago from a grave and acute disease.

As a starting point of the analysis I decided to use the odour of burned pastry. I will now relate the history of this analysis. It could have occurred under more favourable conditions, but, as a matter of fact, what should have taken place in one session was extended over a number of them. She could only visit me during my office hours during which I

get satisfaction for the ill treatment which he received etc

The memories which appear in hysterical at tacks or which can be awakened in them cor respond in all other respects to the causes which we have found as the basis of continuous hys terical symptoms Like these they refer to psychic traumas which were prevented from ad justment through ab reaction or through asso ciative elaboration like these they were ab *sent entirely or in their essential components* in the total memory of normal consciousness and showed themselves as parts of the ideation content of hypnoid states of consciousness with restricted associations Finally they were also amenable to the therapeutic test Our obser vations have often taught us that a memory which has hitherto provoked attacks becomes incapable of it when it is brought to reaction *and associative correction in a hypnotic state*

The motor phenomena of the hysterical at tack can in part be interpreted as the memory of general forms of reaction of the accompany ing affect (like the fidgeting of the whole body to which the infant already resorts) in part as a direct motor expression of this memory and in other parts they like the hysterical stigmata in the permanent symptoms elude this expla nation

A special estimation of the hysterical attack is obtained if one also takes into account the *fact that in hysteria there are groups of ideas* which originated in hypnoid states which are

mentary second consciousness a *condition se conde A persistent hysterical symptom* there fore corresponds to an impingement of this second state upon a bodily innervation other wi e controlled by the normal consciousness But an hysterical attack gives evidence of a higher organization of this second state and if *of recent origin* signifies a moment in which this hypnoid consciousness has gained control of the whole existence that is we have an acute hysteria but if it is a recurrent attack containing a memory we simply have a repe tition of the same Charcot has already given utterance to the thought that the hysterical at tack must be the rudiment of a *condition se conde* During the attack the control of the whole bodily innervation passes over to the hypnoid consciousness *As familiar experiences* show the normal consciou ness is not always entirely repressed by it it may even perceive *the motor phenomenon of the attack while the* psychic processes of the same escape all knowl edge of it

The typical course of a grave hysteria as is well known is as follows At first an ideation is formed in the hypnoid state which after suffi cient growth gains control in a period of *acute hysteria of the bodily innervation and the ex* istence of the patient and creates permanent symptoms and attacks and with the exception of some residuum then ends in recovery If the normal personality can regain the upper hand all that has survived the hypnoid ideation con tent then returns in hysterical attacks and now and then it brings the person back into similar states which are again amenable to influences and eligible for traumas Frequently a sort of equilibrium is then established between the psychic groups which are united in the same per *son attack and normal life go hand in hand* without influencing each other The attack then comes spontaneously just as memories are wont to come but just like memories it can also be provoked by the laws of association The provocation of the attack results either through stimulating a hysterogenic zone or through a new experience which by similarity recalls the pathogenic experience We hope to be able to show that there is no essential differ ence between the apparently two diverse deter minants and that in both cas s a hyperæsthetic *memory is touched In other cases this equi* librium shows a marked lability the attack ap pears as a manifestation of the hypnoidal rem nant of consciousness as often as the normal person becomes exhausted and functionally in capacitated *We cannot disregard the fact that in such cases the attack becomes stripped of its* original significance and may return as a con tentless motor reaction

It remains a task for future investigation to discover what conditions are decisive in deter mining whether an hysterical individuality should manifest itself in attacks in persistent symptoms or in a mingling of both

V

We can now understand in what manner the psycho therapeutic method propounded by us exerts its curative effect *It abrogates the effi cacy of the original non-ab reacted ideas by af fording an outlet to their st angulated affects through speech It brings them to associative correction by drawing them into normal con sciousness (in mild hypnosis) or by el minating them through medical suggestion in the same*

This astonishing and instructive experiment was my model. I decided to proceed on the supposition that my patients knew everything that was of any pathogenic significance and that all that was necessary was to force them to impart it. Whenever I reached a point where to my questions, "Since when have you had this symptom?" or "Where does it come from?" I received the answer "I really don't know this," I proceeded as follows: I placed my hand on the patient's forehead or took her head between my hands and said, "Through the pressure of my hands it will come to your mind; the moment that I stop the pressure you will see something before you, or something will flash through your mind which you must note, it is that which we are seeking. Well, what have you seen or what came into your mind?"

On applying this method for the first time (it was not in the case of Miss Lucie R.) I was surprised to find just what I wanted, and I may say that it has since hardly ever failed me; it always showed me how to proceed in my investigations and enabled me to do all such — — Gradually I

mind, I insisted that it was impossible, that he probably had the right thought, but that he did not believe it and repudiated it, that I would repeat the procedure as often as he wished, and that every time he would see the same thing. Indeed I was always right; the patients had not as yet learned to let their criticism rest. They repudiated the emerging recollection or fancy because they considered it as a useless intruding disturbance, but after they imparted it, it was always shown that it was the right one. Occasionally after forcing, by pressing the head three or four times I got such an answer as "Yes I was aware of it the first time, but did not wish to say it," or "I hoped that it would not be this."

By this method it was far more laborious to broaden the alleged narrowed consciousness than by investigating in the somnambulic state, but it made me independent of somnambulism and afforded me an insight into the motives which are frequently decisive for the "forgetting" of recollections. I am in a position to assert that this forgetting is often intentional and desired, but it is always only *manifestly* successful.

It appeared to me even more remarkable that apparently long forgotten numbers and dates can be reproduced by a similar process, thus demonstrating an unexpected faithfulness of memory.

The insignificant choice which one has in searching for numbers and dates especially allows us to take to our aid the familiar axiom of the theory of aphasia, namely, that recognition is a lesser accomplishment of memory than spontaneous recollection.

Hence, to a patient who is unable to recall in what year, month, or day a certain event took place, enumerate the years during which it might have occurred as well as the names of the twelve months and the thirty-one days of the month, and assure him that at the right number or name his eyes will open themselves or that he will feel which number is the correct one. In most cases the patients really decide on a definite date, and frequently enough (as in the — — — could be ascertained — date — and in — connection of the recollected facts that the dates thus found were incontestable. A patient, for instance, after a date was found by enumerating for her the dates remarked, "This is my father's birthday," and added, "Of course, I expected this episode (about which we spoke) because it was my father's birthday."

I can only lightly touch upon this theme. The conclusion which I wish to draw from all these experiences is that the pathogenic important experiences with all their concomitant circumstances are faithfully retained in memory, even where they seem forgotten, as when the patient seems unable to recall them.

As a sample of the technique mentioned above, that is, of investigating in the non-somnambulic state or where consciousness is not broadened, I will relate — — —

— — — he

— which you — which made an impression on you. — But I do not know it — two-one years. — This does not matter, you will recall it. I

could devote to her but little of my time One single conversation had to be extended for over a week as her duties did not permit her to come to me often from such a distance so that the conversation was frequently broken off and resumed at the next session

On attempting to hypnotize Miss Lucie R she did not lapse into the somnambulic state I therefore was obliged to forego somnambulism and the analysis was made while she was in a state which did not perhaps differ much from the normal

I feel obliged to express myself more fully about the point of the technique of my procedure While visiting the Nancy clinics in 1889 I heard Dr Liebault the old master of hypnotism say Yes if we had the means to put everybody into the somnambulic state hypnotism would then be the most powerful therapeutic agent In Bernheim s clinic it almost seemed that such an art really existed and that it could be learned from Bernheim But as soon as I tried to practise it on my own patients I noticed that at least my powers were quite limited in this respect Whenever a patient did not sink into the somnambulic state after one or two attempts I possessed no means to force him into it However the percentage of somnambulists in my experience was far below that claimed by Bernheim

Thus I had the choice either to refrain from using the cathartic method in most of the cases suitable for it or to venture the attempt without somnambulism by using hypnotic influence in light or even doubtful cases It made no difference of what degree (following the accepted scales of hypnotism) the hypnotism was which did not correspond to somnambulism for every line of suggestibility is independent of the other and nothing prejudices the evocation of catalepsy automatic movements and similar phenomena for the purpose of facilitating the awakening of forgotten recollections I soon relinquished the habit of deciding the degree of hypnotism as in a great number of cases it incited the patient s resistance and clouded the confidence which I needed for the more important psychic work Moreover in mild grades of hypnotism I soon tired of hearing after the assurance and command You will sleep sleep now! such protests as But Doctor I am not sleeping I was forced to bring in the very delicate distinction saying I do not mean the usual sleep I mean the hypnotic—you see you are hypnotized you cannot open your eyes or I really don t want you to sleep I am convinced that many of my colleagues who use psycho therapy know how to get out of such difficulties more skilfully than I they can therefore act differently I however believe that if through the use of a word one can so frequently become embarrassed it is better to avoid the word and the embarrassment Wherever the first attempt did not produce either somnambulism or a degree of hypnotism with pronounced bodily changes I dropped the hypnosis and demanded only concentration I ordered the patient to lie on his back and close his eyes as a means of attaining this concentration With little effort I obtained as profound a degree of hypnotism as was possible

But as I gave up the use of somnambulism I perhaps deprived myself of that prerequisite without which the cathartic method seemed inapplicable For the latter is based on the assumption that in the altered state of consciousness the patients have at their disposal recollections and associations which do not apparently exist in their normal conscious state and that wherever there is no somnambulic broadening of consciousness it must also be impossible to bring about those causal relations which the patient gives the doctor as something unknown to him that is those pathogenic recollections 'which are lacking from the memory of the patients in their usual psychic states or only exist in a most condensed state (Preliminary Communication)

My memory helped me out of this embarrassment I myself saw Bernheim demonstrate that the recollections of somnambulism are only manifestly forgotten in the waking state and can be readily reproduced by some urging accompanied by hand pressure which is supposed to mark another conscious state He for instance imparted to a somnambulist the negative hallucination that he was no longer present and then attempted to make himself noticeable to her by the most manifold and inconsiderate attacks but was unsuccessful After the patient was awakened he asked her what he did to her during the time that she thought he was not there She replied very much astonished that she knew nothing but he did not stop there he insisted that she would recall everything and placed his hand on her forehead so that she should recall things and behold she finally related all that she did not apparently perceive in the somnambulic state and about which she ostensibly knew nothing in the waking state

indecision that the incident occurred. I thou ht that I would lea e the house but ha e re mained. — Aside from the attachment of the children, is there anything particular which at tracts you t them? —"Yes my mother is dis- l related to their mother and when the

The analysis of the subjecti e sensation sm ll seemed compl t It was once bjective a d intimately onnected w th an experience a small scene in which contrary affects con flicted, sorrow at f rsaking the children, and the mortificat whi h despite all urged her to this decision. Her mother's letter naturally re called the moti es f this d cisi n because the thought of eturning to her mother The conflict f the aff cts raised this fact r to a trauma, and the sensati of smell, which was connected with it rem ined a its symbol The only thing to be explained was the fact that out of all the sensory perceptions of that cene the perception of smell was selected as the symbol but I was already prepared to use the chronic nasal affliction as an explanation On being directly questioned he tated that just at that time he uff red from severe coryza and ould scarcely m ll anything but in her excitement she perce ed the od ur f burned pastry it penetrated the organically motivated anosmia.

but lay calmly in a degree of mild suggestibility her eyes constantly closed the features immobile the limbs without motion I asked her whether she remembered on what occasion the smell perception of burned pastry originated — Oh yes I know it well It was about two months ago two days before my birthday I was with the children (two girls) in the schoolroom playing and teaching them to cook when a letter just left by the letter carrier was brou ht in *From its postmark and handwriting* I recognized it as one sent to me by my mother from Glasgow and I wished to open it and read it The children then came running over pulled the letter out of my hand and exclaimed No you must not read it now it is probably a congratulatory letter for your birthday and we will keep it for you until then While the children were thus playing there was a sudden diffusion of an intense odour The children forgot the pastry which they were *cooking and it burned Since then* I have been troubled by this odour it is really always present but is more marked during emotional excitement

Do you see this scene distinctly before you? — As clearly as I experienced it — What was there in it that so excited you? — I was touched by the affection which the children displayed towards me — But weren t they always so affectionate? — Yes but I ju t got the letter from my mother — I can t understand in what way the affection of the little ones and the letter from the mother contrasted a thing which you appear to intimate — I had the intention of going to my mother and my *heart became heavy at the thought of leavin* those dear children — What was the matter with your mother? Was she lonesome that she wanted you or was she sick just then and you expected some news? — No she is delicate but not really sick and has a companion with her — Why then were you obliged to leave the children? — This house had become unbearable to me The housekeeper the cook and the French maid seemed to be under the impression that I was too proud for my position They united in intriguing against me and told the grandfather of the children all sorts of things about me and when I complained to both gentlemen I did not receive the support which I expected I then tendered my resignation to the master (father of the children) but he was very friendly asking me to reconsider it for two weeks before taking any definite steps It was while I was in that state of

scene which acted as a trauma, and left the memory symbol. But why was this scene so effective? I then asked her which scene happened first, this one or the one of the burned pastry?—"The last scene happened first by almost two months."—"Why did you feel the pinch at the father's interference? The reproof was not meant for you."—"It was really not right to rebuke an old man in such a manner who was a dear friend and a guest. It could have been said more calmly."—"Then you were really affected by your master's rudeness? Were you perhaps ashamed of him, or did you think, 'If he could become so impetuous toward an old friend and guest over such a trifle, how would he act towards me if I were his wife'?"—"No, that is not it."—"But still it was about his impetuosity?"—"Yes, about the kissing of the children, he never liked that." Under the pressure of my hands there emerged a still older scene which was the real effective trauma and which bestowed on the scene of the chief accountant the traumatic affectivity.

A few months before a lady friend visited the house and on leaving kissed both children on the lips. The father who was present controlled himself and said nothing to the lady, but when she left he was very angry at the unfortunate governess. He said that he held her responsible for this kissing, that it was her duty not to tolerate it, that she was neglecting her duties in allowing such things, and that, if it ever happened again, he would entrust the education of his children to someone else. This occurred while she believed herself loved, and waited for a repetition of that serious and friendly talk. This episode shattered all her hopes. She thought: "If he can upbraid and threaten me on account of such a trifle of which I am entirely innocent, I must have been mistaken, he never entertained any tenderer feelings towards me, else he would have been more considerate."—It was evidently this painful scene that came to her as the father reprimanded the chief accountant for attempting to kiss the children.

On being visited by Miss Lucie R. two days after the last analysis, I had to ask her what pleasant things happened to her. She looked as though transformed, she smiled, and held her head aloft. For a moment I thought that after all I probably mistook the situations, and that the governess of the children had now become the bride of her master. But she soon dispelled all my suppositions by saying, "Nothing new has happened. You really do not know me. You have always seen me while I was sick and depressed. Usually I am always cheerful. On awaking yesterday morning, my burden was gone, and since then I have felt well."—"What do you think of your chances in the house?"—"I am perfectly clear about that. I know that I have none, and I am not going to be unhappy about it."—"Will you now be able to get along with the others in the house?"—"I believe so, because most of the trouble was due to my sensitiveness."—"Do you still love the master?"—"Certainly I love him, but that does not bother me much. One can think and feel as one wishes."

I now examined her nose and found that the pain and the reflex sensations had almost completely disappeared. She could distinguish odours, but she was uncertain when they were very intense. What part the nasal trouble played in the anosmia, I must leave undecided.

The whole treatment extended over a period of nine weeks. Four months later I accidentally met the patient at one of our summer resorts—she was cheerful and stated that her health continued to be good.

EPICRISIS

I would not like to underestimate the aforesaid case even though it only represents a minor and light hysteria with but few symptoms. On the contrary, it seems to me instructive that even such a slight neurotic affection should require so many psychic determinants, and, on more exhaustive consideration of this history, I am tempted to put it down as an illustration of that form of hysteria which even persons not burdened by heredity may acquire if they have the suitable experiences for it. It should be well noted that I do not speak of a hysteria which may be independent of all predisposition; such form probably does not exist, but we speak of such a predisposition only after the person became hysterical, as nothing pointed to it before. A neuropathic disposition as commonly understood is something different. It is determined even before the disease by a number of hereditary burdens, or by a sum of individual psychic abnormalities. As far as I know none of these two factors could be demonstrated in the case of Miss Lucie R. Her hysteria may therefore, be called acquired, and by and large presupposes nothing more than a very marked susceptibility to acquire hysteria, a characteristic about which we know scarcely anything. In such cases the greatest emphasis

was my employer in whose service I was and in whose house I lived and toward whom I could not feel as independent as towards another What is more I am a poor girl and he is a rich man of a prominent family and if anybody should have had any inkling about my feelings *they would have ridiculed me*

After this I encountered no resistances in elucidating the origin of this affection She told me that the first years of her life in that house were passed *uneventfully* She *fulfilled* her duties without thinking about unrealizable wishes One day however the serious and very busy and hitherto very reserved master engaged her in conversation about the exigencies of rearing the children He became milder and more cordial than usual he told her how much he counted on her in the bringing up of his orphaned children and looked at her rather peculiarly It was in this moment that she began to love him and gladly occupied herself with the pleasing hopes which she conceived during that conversation However as this was not followed by anything else and despite her waiting and persevering no other confidential heart to heart talk followed she decided to *crowd it out of her mind She quite agreed* with me that the look which she noticed during the conversation was probably intended for the memory of his deceased wife She was also perfectly convinced that her love was hopeless

After this conversation I expected a decided change in her condition but for a time it did not take place She continued depressed and moody—a course of hydrotherapy which I prescribed for her at the same time refreshed her somewhat in the morning The odour of *burned pastry did not entirely disappear* though it became rarer and feebler it appeared as she said only when she was very much excited

The continuation of this memory symbol led me to believe that besides the principal scene it also represented many smaller side traumas and I therefore investigated everything that might have been in any way connected with the scene of the burned pastry We thus passed through the theme of family friction the behaviour of the grandfather and others and with that the sensation of burned odour gradually disappeared Just then there was a lengthy interruption occasioned by a new nasal affliction which led to the discovery of the caries of the ethmoid

On her return she informed me that she received many Christmas presents from both gentlemen as well as from the household servants as if they were trying to appease her and wipe away the recollection of the conflicts of the last months These frank advances made no impression on her

On questioning her on another occasion about the odour of burned pastry she stated that it had entirely disappeared but instead she was now bothered by another and similar odour like the smoke of a cigar This odour really existed before it was only concealed by the odour of the pastry but now it appeared as such

I was not very much plea ed with the success of my treatment What occurred here is what a mere symptomatic treatment is generally blamed for namely that it removes one symptom only to make room for another Nevertheless I immediately set forth to remove this new memory symbol by analysis

This time I did not know whence this subjective sensation of smell originated nor on what important occasion it was objective On being questioned she said They constantly smoke at home I really don t know whether the smell which I feel has any particular significance I then proposed that she should try *to recall things under the pressure of my hands* I have already mentioned that her recollections were plastically vivid that she was of the visual type Indeed under the pressure of my hand a picture came into her mind—at first only slowly and fragmentarily It was the dining room in which she waited with the children for the arrival of the gentlemen from the factory for dinner— Now we are all at the table the gentlemen the French maid the housekeeper the children and I It is the same *as usual — Just keep on looking at that picture* It will soon become developed and specialized — Yes there is a guest the chief accountant an old gentleman who loves the children like his own grandchildren but he dines with us so frequently that it is nothing unusual — Just have patience keep on looking at the picture something will certainly happen — Nothing happens We leave the table the children take leave and go with us to the *second floor as usual — Well? —* There really is something unusual here I now recognize the scene As the children leave the chief accountant attempts to kiss them but my master jumps up nd shouts at him Don t kiss the children! I then experienced a stitch in the heart and as the gentlemen were smoking this odour remained in my memory

This therefore was the second deeper seated

the last few years had brought them much misfortune and little pleasure. First the patient's father died, then the mother underwent a serious operation on her eyes and soon thereafter a married sister succumbed to a chronic cardiac affection following childbirth. Our patient had taken an active part in all the afflictions especially in the nursing of the sick.

I made no further progress in the case after I had seen the twenty-four-year-old patient for the first time. She seemed intelligent and psychically normal, and bore her affliction with a cheerful mien, thus ... dly recalling the *belle indifférence* of hysterics. She walked with the upper part of her body bent forward but without any support; her walk did not correspond to any known pathological gait, and it was in no way strikingly bad. She complained only of severe pains and of early fatigue in walking as well as standing, so that after a brief period she had to seek rest in which the pains diminished, but by no means disappeared. The pain was of an indefinite nature—one could assume it to be a painful fatigue. The seat of the pain was quite extensive, but definitely circumscribed on the superficial surface of the right thigh. It was from this area that the pains radiated and were of the greatest intensity. Here too the skin and muscles were especially sensitive to pressure and pinching, while needle pricks were rather indifferently perceived. The same hyperalgesia of the skin and muscles was demonstrable not only in this area but over almost the entire ... of both legs. The muscles were perhaps more painful than the skin, but both kinds of pains were unmistakably most pronounced over the thighs. The motor power of the legs was not diminished, the reflexes were of average intensity ... d, as all other symptoms were lacking there was no basis for the assumption of a serious organic affection. The disease developed gradually during two years and changed considerably in its intensity.

I did not find it easy to determine the diagnosis, but for two reasons I concluded to agree with my colleague. First because it was rather strange that such a highly intelligent patient should not be able to give anything definite about the character of her pains. A patient suffering from an organic pain, if it is not accompanied by any nervousness, will be able to describe it definitely and calmly; it may perhaps be lancinating, appear at certain intervals and extend from this to that location, or in his opinion it may be evoked by this or that influence. The neurasthenic in describing his pain gives the impression as being occupied with some difficult mental problem, something far beyond his powers. His features are tense and distorted as though under the domination of a painful affect; his voice becomes shriller, he struggles for expression, he rejects all designations that the physician makes for his pains even though they are undoubtedly afterwards found to be correct. He is ostensibly of the opinion that language is too poor to give expression to his feelings. These sensations are something unique; they never existed before so that they cannot be exhaustively described. It is for this reason that he never tires of constantly adding new details, and when he has to stop he is distinctly controlled by the impression that he was unsuccessful in making himself

the opposite behaviour, and we had to conclude from this that she attributed sufficient significance to the pain, but that her attention was concentrated on something else of which the pains were only the accompanying phenomena, perhaps on thoughts and sensations which were connected with pain.

A still greater determination for the conception of the pain must however be found in a second factor. If we irritate a painful area in a patient suffering from an organic disease or neurasthenia, his physiognomy will show a definite expression of discomfort or of physical pain, the patient winces, refuses to be examined, and assumes a defensive attitude. But if anyone pinched or pressed Miss von R.'s hyperalgesic skin or muscles of her legs, her face assumed a peculiar expression approaching nearer pleasure than pain; she cried out and—I had to think of a perhaps pleasurable tickling—her face reddened, she threw her head

teria and that the irritation touched a hysterogenic zone.

Her mien was not adequate to the pain which the pinching of the muscles and skin were supposed to excite. It probably harmonized better with the contents of the thoughts which were behind the pain and which were evoked in the patient through a stimulation of those parts of

—[1] A hypochondriac afflicted with anxiety neurosis.

lies in the nature of the trauma and naturally in connection with the reaction of the person to the trauma It is an indispensable condition

ego and an idea [illegible]

I hope to be able to show in another place how a variety of neurotic disturbances originate from the different procedures which the *ego* pursues in order to free itself from that incompatibility *The hysterical form of defence for which a special adaptation is required* consists in a conversion of the excitement into physical innervation The gain brought about by this process consists in the crowding out of the unbearable idea from the ego consciousness which then contains instead the physical reminiscences *produced by conversion—in our case* the subjective sensation of smell—and suffers from the affect which more or less distinctly connects itself with these reminiscences The situation thus produced can no longer be changed for the resistance which would have striven for the adjustment of the affect was *eliminated through repression and conversion* Thus the mechanism producing hysteria corresponds on the one hand to an act of moral faintheartedness on the other hand it presents itself as a protective process at the command of the ego There are many cases in which it must be admitted that the defence against the increased excitement through the production of hysteria may actually have been most expedient but more frequently one will naturally come to the conclusion that a greater measure of moral courage would have been of more advantage to the individual

Accordingly the real traumatic moment is that in which the conflict thrusts itself upon the ego and the latter decides to banish the incompatible idea Such banishment does not annihilate the opposing idea but merely crowds it into the unconscious *When this process occurs for the first time* it forms a nucleus or a point of crystallization for the formation of a new psychic group separated from the ego around which in the course of time everythin collects which is in accord with the opposing idea *The splitting of consciousness in such* cases of acquired hysteria is thus desired and intentional and is often initiated by at least one arbitrary act But as a matter of fact something different happens than the individual expects he would like to *eliminate an idea as though it never came to pass* but he only succeeds in isolating it psychically

The traumatic factor in the history of our patient corresponds to the scene created by her master on account of the kissing of the children For the time being this scene remained *without any palpable effects* perhaps it initiated the depression and sensitiveness but I leave this open the hysterical symptoms however commenced later in moments which can be designated as *auxiliary* and which may be characterized by the fact that in them there was a simultaneous inter fusion of both separated *groups just as in the broadened som*nambulic consciousness The first of these factors in which the conversion took place in Miss Lucie R was the scene at the table when the chief accountant attempted to kiss the children The traumatic memory helped along and she acted as though she had not entirely banished *her attachment for her master* In other cases we find that these different factors coalesce and the conversion occurs directly under the influence of the trauma

The second auxiliary factor repeated almost precisely the mechanism of the first A strong *impression transitorily re established the unity* of consciousness and the conversion took the same route that was opened to it the first time It is interesting to note that the symptom which occurred second concealed the first so that the latter could not be distinctly perceived until *the former was eliminated The reversal of the succession of events to which also the analysis* had to be adapted seemed quite remarkable In a whole series of cases I found that the symptoms which came later covered the first and only the last thing in the analysis con*tained the key to the whole*

The therapy here consisted in forcing the union of the dissociated psychic groups with the ego consciousness It is remarkable that the success did not run parallel with the accomplished work the cure resulted suddenly only *after the last part was accomplished.*

CHAPTER 3

CASE HISTORY OF MISS ELISABETH VON R

IN the fall of 1892 I was requested by a friend*ly colleague to examine a young lady who had* been suffering from pains in her legs for over two years so that she walked badly He also added to his request that he had diagnosed the case as hysteria though none of the usual symptoms of the neurosis could be found He stated that he knew very little of the family but that

B *Fre d Stud b Hyster* (1895) Cas V

ment. It thus happened that she became especially and devotedly attached to her jovial and broadminded father who was wont to say that his daughter took the place of both a son and friend with whom he could exchange thoughts. As much as the girl gained in mental stimulation in consequence of this intercourse it did not escape the father that her psychic constitution deviated from that ideal which one so much desires to see in a girl. Jocosely he called her "pert and disputatious." He warned her against being too confident in her judgments against her tendencies to tell the truth regardless of everybody and expressed his opinion that she would find it difficult to get a husband. As a matter of fact she was very discontented with her girlhood. She was filled with ambitious plans. She wished to study or to obtain a musical education and revolted at the thought of being forced to give up her ambition and sacrifice her freedom of judgment for the sake of marriage. Meanwhile, she was proud of her father, of the regard and social position of her family and jealously guarded everything connected with these matters. The indifference with which she treated her mother and older sisters as will be shown was considered by her parents to be due to the blunter side of her character.

The age of the girls impelled the family to move into the metropolis, where for a time Elisabeth enjoyed a richer and gayer social life. But then came the calamity which destroyed the happiness of the home. The father either concealed or overlooked a chronic cardiac affection, and one day he was brought home in an unconscious state after the first attack of oedema of the lungs. This was followed by an illness of one and a half years during which Elisabeth took the most prominent part in nursing him. She slept in her father's room, awoke at night at his call watched over him faithfully during the day and forced herself to appear cheerful while he went through a hopeless condition with amiable resignation. The beginning of her affection must have been connected with this period of her nursing, for she could recall that during the last half year of this care she had to remain in bed on one occasion for a day and a half on account of severe pain in her right leg. She maintained, however, that these pains soon passed away and excited neither worry nor attention. As a matter of fact, it was about two years after the death of her father that she began to feel sick and unable to walk on account of pain.

The void which her father left in the life of this family consisting of four women, the social solitude, the cessation of so many relations which promised stimulation and pleasure, the increased infirmity of the mother, all these beclouded the patient's emotional attitude, but simultaneously aroused a warm desire that the family might soon find a substitute for the lost happiness, and impelled her to concentrate her entire devotion and care on the surviving mother. At the end of the year of mourning the eldest sister married a talented and ambitious man of notable position who seemed to have been destined for a great future by virtue of his mentality but who however soon developed a morbid sensitiveness and egotistic perseveration of moods, and dared to show his disregard for the old lady in the family circle. That was more than Elisabeth could endure. She felt it her duty to take up the cudgels against her brother-in-law whenever he gave occasion for it, whereas the other women took lightly the outburst of his excited temperament. She felt it a painful disillusionment that the reconstruction of the old family happiness could be impeded by such a disturbance, and she could not forgive her married sister because, due to feminine docility, the latter firmly avoided espousing either cause. Thus a whole series of scenes remained in Elisabeth's memory which were connected with a number of partially unuttered grievances against her first brother-in-law. But her greatest grievance against him was the fact that for the sake of a prospective promotion he moved his small family to a distant city in Austria and thus helped to increase her mother's isolation. On this occasion Elisabeth distinctly felt her inability and helplessness to afford her mother a substitute for her lost happiness as well as the impossibility of following out the resolution she made on the occasion of her father's death.

The marriage of the second sister seemed more promising for the future welfare of the family. The second brother-in-law, although not of the same mental calibre as the first, was a man after the heart of delicate ladies and his behaviour reconciled Elisabeth to the institution of marriage and to the sacrifice it entailed. What is more, the second couple remained near her mother and the child of this brother-in-law and the second sister became Elisabeth's pet. Unfortunately, the year during which the child was born was clouded by another event. The visual affliction of the mother demanded many weeks treatment in a dark room in which Elisabeth participated. Follow

the body associated with them I have repeated ly observed similar significant expression from stimulation of hyperalgesic zones in unmistak able cases of hysteria The other gestures evi dently corresponded to the slightest suggestion of an hysterical attack

We could not at that time find any explana tion for the unusual localization of the hyster o enic zone That the hyperalgesia chiefly con cerned the muscles gave material for reflection The most frequent affliction which could pro duce diffuse and local pressure sensitiveness of the muscles is rheumatic infiltration or com mon chronic muscular rheumati m of its apti tude to mask nervous ailments I have spoken The consistency of the painful muscles in Miss von R did not contradict this assumption as there were many hard cords in the muscle mas ses which seemed to be especially sensitive There was probably also an organic change in the muscles in the assumed sense upon which the neurosis leaned and the significance of which was markedly exa gerated by the neu rosis

The therapeutic procedure was therefore based on the assumption of a mixed affection We recommended systematic massage and faradization of the sensitive muscles regardless of the pain it produced and in order to remain in contact with the patient I treated her legs by means of strong Franklin sparks To her question whether she should force herself to walk we answered decidedly in the affirmative

We thus attained a slight improvement She particularly liked the painful shocks of the in fluence machine and the stronger they were the more they seemed to remove her pains My colleague meanwhile prepared the soil for the psychic treatment and when after four weeks of this sham treatment I proposed it and explained to the patient the procedures and its effects I found a ready understanding and only a slight resistance

The work which I then began turned out to be the most arduous undertaking that ever fell to my lot and the difficulty of giving an ac count of this work ranks well with the obstacles that had to be overcome For a long time too I did not understand the connection between the history of the disease and the affliction which should really have been cau ed and de termined by this series of events

When one undertakes a cathartic treatment he at first asks himself whether the patient understands the origin and cause of her suffer ing If that is so one does not need any spe cial technique to cause her to reproduce the history of her ailment The interest shown in her the understanding which we foreshadow the hope of recovery extended to her all these induce the patient to give up her secrets In the case of Miss Elisabeth it seemed probably right from the very beginning that she was conscious of the reasons for her suffering that she had only a secret but no foreign body in consciousness On looking at her one had to think of the poet s words That mask indicates a hidden meaning

At first I could therefore dispense with hyp nosis reserving it however for future use should conditions arise in the course of the confession for which explanation the memory would not suffice Thus in this first complete analysis of an hysteria which I had under taken I attained a process of treatment which I later raised to a method and intentionally used as a process of clearing stratum by stra tum the pathogenic psychic material which we were pleased to compare with the technique of excavating a buried city At first I let the patient relate what was known to her paying careful attention wherever a connection re mained enigmatic or where a link in the chain of causation seemed to be lacking Later I penetrated into the deeper strata of memory by using for those locations hypnotic investiga tions or a similar technique The presupposi tion of the whole work was naturally based on the expectation that a perfect and sufficient determination could be demonstrated The methods of the deeper investigation will soon be discussed

The history which Miss Elisabeth gave was quite dull and was woven of manifold painful experiences During this recital she was not in a hypnotic state I merely asked her to lie down and keep her eyes closed I however made no objection if from time to time she opened her eyes changed her position or sat up Whenever she entered more deeply into a part of her his tory she seemed to lapse spontaneously into a condition resembling a hypnotic state She then remained motionless and kept her eyes firmly closed

I shall now reproduce the results of the most superficial stratum of her memory As the youngest of three daughters she spent her youth with her parents to whom she was devotedly attached on their estate in Hungary Her moth er s health was frequently disturbed by an af fliction of the eyes as well as by a nervous ail

the orig n of which I ha e thoroughly dis cussed in the preced n ob ervation of Miss Luc e This was done by requesting the patient unfail ngly to inform me of whatever appea ed before her mind s eye or flashed through her memory at the moment of the pressure She was silent for a long time and then admitted that on my pressure he thought of an e e ing

With this first i e u new shaft was opened the c ntent of which I then gradu lly brought out We dealt here rather w th a ecret for with the except on of a mutual friend no one knew anything of the relat o ship and the hopes connected w th it. It concerned the son of an old fr endly family who formerly li ed in the neighbourhood

The you g man be ng an orphan attached himself w th great devoti to her father who guided him in his career and this veneration f r the father w s naturally extended to the l dies of the family Numerous reminiscences of joint readi gs exchange of views and remarks which had been repeated to her marked th gradual growth of her convict on that he loved and understood her and that a marriage with him would not impose upon her the sacr fice that she feared U happ ly he was only slightly lder tha she and as yet far from independ ent She however firmly resolved to wa t for him

W th the ser us illn ss of her father and the nec ssity of nursing him these relat s be came less frequ nt The eve ng wh ch she e called first really mark d the height of her feeli gs but e en then there w s no e change of deas between them on the subject It was only at the urging f her f m ly that she con ented to l e the s k bed th t even g and atte d th ocial aff where she was to meet h m She wi hed t hasten hom ea ly b t he w fo ced t emain a d only yielded o h s promi g to accomp y her home At o t me had he enterta ed u h a tender regard for him a d ri g th s walk but after r turn ng h me at a late hour in th s bl s f l state and findi g the c d t n f h r f ther aggravated he b tte ly rep oached herself for having sac rificed s m ch f r h r own musement It wa the last t me that she left he ck f the for a whole ve g and thereafter she saw her f d nly r ely Afte the d th f h r f th he seemed t hold himself aloof out of re

ing this an operation proved necessary and the excitement connected with this occurred at the same time as the first brother in law made preparations to move Finally the operation having been skilfully performed proved suc cessful and the three families met at a sum mer resort There Elisabeth exhausted by the worries of the past months had the first oppor tunity to recuperate from the effects of the suf fering *and anxiety to which the family* had been subjected since the death of her father

But just during this sojourn in the summer resort Elisabeth became ill with pain and weakness These pains which had been notice *able for a short while some time previously* manifested themselves severely for the fir t time after taking a warm bath at a small spa A long walk actually half a day s hike a few days previously was thought to have had some connection with the onset of the pains so that it was quite easy to gain the impression that Elisabeth at first became *fatigued* and then caught cold

From now on Elisabeth became the patient in the family Following the advice of the phy sician she spent the rest of the summer in Bad Gastein *whither she went with her mother* but not without having a new worriment to think about The second sister was again pregnant and the information as to her condition was quite unfavorable so that Elisabeth could hard ly decide to take the journey to Gastein After barely two weeks at Gastein both mother and *sister were recalled because things were not well* with the patient at home

An agonizing journey which for Elisabeth was full of pain and anxious expectations was *followed by certain si ns at the railroad sta* tion which forbode the worst and then on entering the sickroom they were confronted with the *reality—that they had arrived too* late to take leave of the dying one

Elisabeth not only suffered *from the loss of* this sister whom she dearly loved but almost as much from the thou hts instigated by her death and from the chan es which it entailed The sister had succumbed to heart trouble which was aggravated by the pregnancy

The idea then came to her mind that heart trouble was *the paternal inheritance of the* family It was then recalled that in her early girlhood the decea ed went through an attack of chorea with a slight heart affection The members of the family then blamed themselves and the physicians for permitting the mar riage and they could not help reproaching the unfortunate widower for endan ering his wife s

—

found this happiness would have termina in this way constantly occupied Elisabeth s mind Moreover she again saw everything go *to pieces that she had planned for her mother* The widowed brother in law was inconsolable and withdrew from his wife s family It seemed that his own family from whom he was es tranged during his short and happy married life took advantage of the opportunity to draw him back into their own circle There was no *way of maintaining the former union* out of regard for his unmarried sister in law it would have seemed improper to live to ether with his mother in law and as he refused to relinquish his child the only legacy of the deceased to the *two ladies they accused him for the first time* of heartlessness Finally and this was not the *least painful* Elisabeth received some definite information concerning a disagreement between the two brothers in law the cause of which she could only surmise It seemed that the wid ower made some financial demand which the *other brother in law considered unjustifiable* indeed in view of the mother s recent sorrow he could only designate it as a wicked extor tion This then was the history of the ambitious and lovable young woman Resentful of her fate embittered over the failure of her little plans to restore the family lustre of those *dear to her some were dead some away* and some estranged—without any inclination to seek refuge in the love of a strange man she lived thus for a year and a half away from al *most all social relations nursing her mother* and her pains

If one could forget greater suffering and wished *to read one s self into the psychic life* of a girl one could hardly deny Miss Elisabeth a sincere human sympathy *But what about the* physician s interest in this sorrowful tale and its relation to her painful and weak gait what about the prospects of explaining and curing this case by the knowledge which we may per haps obtain from these psychic traumas?

For the physician the confession of this pa *tient* was at first a great disappointment For to be sure it was a history composed of banal *mental shocks from which we could neither* explain why the patient became afflicted with hysteria nor how *the hysteria* assumed the form of the painful abasia It explained neither the causation nor the determination of the hys

that I used to remark half jokingly that during each treatment I carried away a certain number of pain motives, and that when I had cleared them all out she would be well. She soon reached a stage during which she had no pain most of the time. She consented to walk a great deal and to give up her hitherto self imposed isolation. During the analysis I followed up now the spontaneous fluctuations of her condition, and now some fragments of her sorrowful tale which I felt was not sufficiently exhausted. In this work I made some interesting discoveries, the principles of which I could later verify in other patients.

In the first place, it was found that the spontaneous fluctuations never occurred unless provoked associatively by the events of the day. On one occasion she heard of an illness in the circle of her acquaintances which recalled to

On

other occasion it was a letter from her absent sister showing distinctly the influence of the inconsiderate brother-in-law and this awakened a pain which made her crave to relate a family scene not reported before.

As she ever reproduced the same pain motives twice we seemed to be justified in the expectation that the stock would in time become exhausted, and I did not in any way prevent her from getting into situations conducive to evoking new memories which had not yet come to the surface. Thus for example I asked her to visit the grave of her sister or I urged her to go in society where she was apt to meet her youthful friend, who happened to be in the city.

In this manner I obtained an insight into the mode of origin of a hysteria which could be designated as *monosymptom*... I found for example, that the right leg became painful during our hypnosis when we dealt with memories relating to the nursing of her father, to her young friend, and to other things which occurred during the first part of the pathogenic period while the pain in the left leg appeared as soon as I evoked the memory of her lost sister of both brothers-in-law in brief of an impression relating to the second half of the history. My attention having been called to this by this constant behaviour I went further in my investigations and gained the impression that the detalization went perhaps still further and that every new psychic cause of painful feeling might have some connection with a different located pain area in the legs. The original painful location on the right thigh referred to the nursing of her father and as the result of new traumas the painful area then grew by apposition so that strictly speaking we had here not one single physical symptom connected

on into the uses ound

that the patient's attention was turned away from these relations

tions as this "What is the origin of the pains in walking standing or lying?" She answered these questions partially uninfluenced, partially under the pressure of my hand. We thus obtained two results. In the first place she grouped all the scenes connected with painful impressions according to their occurrence sitting standing etc. Thus for example she *stood* at the door when her father was brought home with his cardiac attack and in her fright remained as though rooted to the spot. To this first quotation fright while *standing* she connected more recollections up to the overwhelming scene when she again *stood* as if pinned near the death bed of her sister. The whole chain of reminiscences should justify the connection of the pains with the standing up and could also serve as an association proof except that one must be mindful of the fact that in all these events another factor must be demonstrated that which had directed the attention—and consequently the conversion—precisely to the standing (walking sitting etc.) The explanation for this direction of attention could hardly be sought in other connections than the fact that walking standing and lying are connected with functions and conditions of those members which here bore the painful zones namely the legs. We could then easily understand the connection between the astasia abasia and the first scene of conversion in this history.

Among the scenes which according to this review had made the walking painful, one became most prominent. It referred to a walk she had taken in a large company at the watering place which apparently lasted too long. The deeper circumstances of this occurrence re

spect for her orrow and business affairs later took him to other regions Gradually she came to the realization that his interest in her was suppressed by other feelings and that he was lost to her This failure of her first love pained *her as often as she thought of it*

In this relationship and in the above mentioned scene to which it led I had to seek the causation of the first hysterical pain A conflict or a state of incompatibility arose through the contrast between the happiness which she had not at that time denied herself and the sad condition in which she found her father upon her arrival home As a result of this conflict the erotic ideas were repressed from the associa*tions and the affect connected with them* was utilized in aggravating or reviving a simultaneously (or somewhat previously) existing physical pain It was thus the mechanism of a *conversion for the purpose of defence* as I have shown circumstantially in another place

To be sure we have room here for all kinds of observations I must stress the fact that I did not succeed in demonstrating from her memory that the conversion took place at the *time of her returning home I therefore investi*gated for similar experiences which might have occurred while she was nursing her father and *I evoked a number of scenes among which* was one during which she had to jump out of bed with bare feet in a cold room to respond to the repeated *calls of her father I was inclined to* attribute to this factor a certain significance for in addition to complaining of pain in her legs she also complained of tormenting sensations of coldness Nevertheless here too I could not with certainty lay hold of the scene which could be designated as the scene of conversion This led me to admit that there was some gap in the explanation until I recalled that the hysterical pains in the legs were really not present at the time she nursed her father From her memory she recalled only a single attack of pain lasting a few days to which at that time she paid no attention I then directed my attention to the first appearance of the pains Here I was successful in awakening a *definite* memory Just at that time a relative visited her she could not receive him because she was ill in bed and he had the misfortune *to find* her ill on another occasion two years later But the search for the psychic motive of these first pains failed as often as it was repeated I believed that I could assume that these first pains were due to a slight rheumatic attack and really *had no psychic basis* and I *could also discover that this organic trouble* was the model for the later hysterical imitation at all events that it occurred *before* the scene of being accompanied home That these mild organic pains should have continued for some time without her paying much attention to them was quite possible when we consider the nature of the situation The obscurity *re*sulting from this namely that the analysis pointed to a conversion of psychic excitement *into bodily pain at a time when such pain* was certainly not perceived and not recalled—this problem I hope to be able to solve in later considerations and by *other examples*

With the discovery of the motive for the first conversion we began a second more fruitful period of the treatment In the first place very soon afterward the patient surprised me with the statement that she now knew why the pains always radiated from that definite location on the right thigh and were most painful there This was the exact place upon which her father s leg rested every morning while he *changed the bandages of his badly swollen leg* That occurred hundreds of times and strange to say she did not think of this connection un*til today She thus gave me the desired explana*tion for the origin of an *atypical* hysterogenic zone Furthermore during our analysis her *painful legs always joined in the discussion* I mean the following remarkable state of affairs The patient was as a rule free from pain when we began our work but as soon as I evoked some recollection by question or by pressure of the head she at first reported some pain usually of a very vivid nature and then winced and placed her hand on the painful area This awakened pain remained constant as long as the patient was dominated by the recollection reaching its height when she was about to utter the essential and critical part of her communication and disappeared with *the last words* of the statement I gradually learned to use this awakened pain as a compass Whenever she became mute but *still claimed* to have pains I knew that she had not told me everything and urged her to continue the confession until the pain was *spoken away* Then only did I awaken a new recollection

During this period of ab reaction the pa*tient s condition showed such a striking im*provement both somatically and psychically

The Defence-N uro-P ychoses (1894) p 81 ff below

I c th l d p th t thi p i espec lly f th thighs was f a *cur th se* t re.

ves. At other times there seemed to be in- stances, the nature of which I could not at the time surmise When I applied pressure she remained that nothing came into her mind. I repeated the pressure and told her to wait, but still nothing would come. At first, when such obstinacy manifested itself I determined to discontinue the work and to try again later as the day seemed unpropitious. Two observations however caused me to change my procedure Firstly because such failure of this method occurred only when I found Elisabeth cheerful and free from pain and never when she had a bad day, secondly because she frequently made assertions of seeing nothing after the lapse of a long pause during which her tense and absorbed mind betrayed to me some inner psychic process I therefore, decided to assume that the method never failed, that under the pressure of my hands Elisabeth had each time perceived some idea or had seen some picture but that she was not always ready to impart it to me and attempted to suppress what was conjured up I could think of two motives for such conceal ment; either Elisabeth subjected the idea that came to her mind to an unjustified criticism thinking it not sufficiently important or unsuitable as an answer to the question, or she feared to say it because that statement was too disagreeable to her. I, therefore proceeded as if I were perfectly convinced of the reliability of my technique Whenever she asserted that nothing came into her mind, I did not let that pass, I assured her that something must have come to her but that perhaps she was not attentive enough, that I was quite willing to repeat the pressure I also told her not to enter [illegible] the correctness of [illegible] she concealed from me and that, as long as she would continue to do so she would not get rid of her pains. Through such urging I came to the realization that no pressure remained unsuccessful. I then had to assume that I correctly recognized the state of affairs and, indeed, I won perfect confidence in my technique through this analysis. It often happened that she did not make a statement until after the third pressure and then added "Why I could have told you that the first time — Indeed, why did you not say it — I thought that it was not correct, I thought that I could do it, but it recurred each time During this difficult work I began to attach a profounder significance to the resistance which the patient showed in the reproduction of her recollection and I carefully noted these occasions in which it was especially striking

I now come to the description of the third period of our treatment. The patient felt better she was psychically unburdened and less [illegible] but the pains were restrained in her behaviour but the pains were manifestly not removed, and reappeared from time to time with the old severity The inner time with the old severity The imperfect cure went hand in hand with the imperfect analysis as yet, I did not know in what moment and through what mechanisms the pains originated. During the reproduction of the most manifold scenes of the second period and the observation of the patient's resistance towards the reproduction I had a definite suspicion which I did not dare use as a basis for my action. An accidental observation turned the issue While working with the patient one day I heard the steps of a man in the adjacent room and a rather pleasant voice asking some questions. My patient immediately arose requesting me to discontinue the treatment for the day because she heard her brother in law who had just arrived, asking for her Before this disturbance she was free from pain but now she betrayed by her mien and gait the sudden appearance of violent pains This strengthened my suspicion and I decided to elicit the decisive explanation.

I therefore questioned her again concerning the circumstances and causes of the first appearance of the pains. Her thoughts were directed to the summer resort in that watering place where she had been before making the journey to Gastein A number of scenes were reproduced which had already been treated less exhaustively They recalled her frame of mind at that time the exhaustion following the worriment about her mother's vision, and the nursing of her mother during the time of the operation and her final despair at being unable as a lonesome girl to enjoy or accomplish anything in life. Until then she felt strong enough to dispense with the help of a man, but now she was overcome by a feeling of her womanly weakness a yearning for love in which, to put it in her own words her obdurate self began to soften. In such humour the happy marriage of her younger sister made the profoundest

The mechanisms of resistance which the [illegible] now counts among the great pillars of psycho-analytic technique are mentioned here for the first time.—T

vealed themselves only hesitatingly and left many a riddle unsolved She was in an especially good humour and gladly joined the circle of friendly persons it was a lovely day not too warm her mother remained at home her older sister had already departed the younger *one felt indisposed* but *did not* wish *to mar* her pleasure The husband of the second sister at first declared that he would remain at home with his wife but finally went along for her (Elisabeth s) sake This scene seemed to have *a great deal to do with the first appearance of* the pains for she recalled that she returned home from the walk very fatigued and with severe pains She could not however say definitely whether she had perceived the pains before this I took for granted that if she had suffered any pain she would hardly have resolved to enter upon this long walk On being questioned whence the pains originated on this walk she answered rather indefinitely that the contrast between her solitude and the married happiness of her sick sister of which she was constantly reminded by the behaviour of her brother in law was painful to her

Another scene closely related to the former in point of time played a part in connection with the pains on *sitting* It was a few days later her sister and brother in law had already departed and she found herself in a tense and longing mood She arose in the morning and ascended to the top of a small hill which they were frequently wont to visit together and which afforded a very pretty view There she sat down on a stone bench and gave free play to her thoughts Her thoughts again revolved on her lonesomeness *the fate of her family and* she now frankly admitted that she entertained the eager wi h to become as happy as her sister After this morning s meditation she returned home with severe pains In the evening of the *same day she took the bath after which the* pains definitely appeared and continued persistently

We could further ascertain with great certainty that the pains on walking and standing *diminished* in the beginning *on lying down* Only after she heard of her sister s illness and left Gastein in the evening *spending a sleepless* night in the sleeping car tormented simultaneously by worrying over her sister and by violent pains—it was only then that the pains appeared for the first time while she was lying down and *throughout that time lying down* was even more painful than walking or standing

In this way the painful sphere grew by *apposition first* because every new pathogenically affecting theme occupied a new region of the legs second every one of the impressionable scenes left a trace because it produced lasting always more cumulative catheses of the different functions of the legs thus connecting these functions with the sensations of pain There was unmistakably however still a third mechanism which furthered the production of atasia abasia When the patient finished the recitation of a whole series of events with the plaint that she then perceived pain on *standing alone* and when in another series referring to the unfortunate attempt of bringing about new conditions in the family she was not tired of repeating that the painful part of it was the feeling of her helplessness the sensation that she *could make no headway* I then had to think that her reflections too influenced the formation of the abasia and I had to assume that she directly sou ht a *symbolic* expression for her painfully accentuated thoughts and had found it in the a gravation of her pains That *somatic symptoms* of hysteria

conclusive evidence in the epicrisis to this history In Miss Elisabeth von R the psychic mechanism of the symbolization was not in the foreground it had not produced the abasia but everything pointed to the fact that the already existing abasia had in this way undergone a considerable reinforcement Accordingly this abasia as I encountered it in the stage of development *could not only be compared to a* psychically associative paralysis of function but also to a symbolic paralysis of function

Before I continue with the history of my patient I will add something about her behaviour *during the second period of the treatment* Throughout this whole analysis I made use of the method of evoking pictures and ideas by pressing her head a method therefore which would be inapplicable without the full cooperation and voluntary attention of the patient At times her behaviour left nothing to *be desired and at such periods it was really* surprising how promptly and how infallibly the individual scenes belonging to one theme succeeded each other in chronological order It was as if she read from a large picture book the pages of which passed in review before her

C th m a m of gy affect which
l ests d a *t*

made another despairing effort to reject the explanation, saying that it was not true that I suggested it to her, it could not be, she was incapable of such baseness and that she would never forgive herself for it. It was quite easy to prove to her that her own information allowed no other interpretation, but it took a long time before the two reasons that I offered for consolation, namely that one is not responsible for one's feelings and that her behaviour, her sickness under those circumstances, was sufficient proof of her moral nature—I say it took a long time before these consolations made an impression on her.

I was now forced to pursue more than one course in order to alleviate the patient. In the first place I wished to give her the opportunity to rid herself by ab-reaction of the material long since accumulated. We investigated the first impressions of the relations with her brother-in-law, the beginning of those unconsciously kept affectionate regards. We found here all those little indications and forebodings which on retrospection showed a fully developed passion. In his first visit to the house he mistook her for his destined bride and greeted her before he greeted her older and more homely sister. One evening they entertained each other so vivaciously and seemed to understand each other so well that the bride interrupted them with this half serious remark: "You two indeed would have suited each other very nicely." On another occasion, while at a social gathering where no one knew of the engagement, the conversation drifted to the young man, and a young lady indiscreetly remarked about a blemish in his figure, a juvenile joint affliction. The bride herself remained calm while Elisabeth flew into a passion, and with an ardour which even she herself could not afterwards understand, defended the straight form of her future brother-in-law. While we worked our way through these reminiscences it became clear to Elisabeth that her affection for her brother-in-law had slumbered in her for a long time, perhaps since the beginning of their relations, and had concealed itself so long under the mask of a mere kinsmanlike affection, as only her very delicate family feeling would allow.

This ab-reaction benefited her much, but I was able to give her still more relief by taking a friendly interest in her present state of affairs. With this object in view I sought an interview with Mrs. von R., whom I found to be an intelligent and refined lady, whose courage to face life however was somewhat impaired through the last misfortunes. From her I learned that the accusation of rude extortion which the older brother-in-law had brought against the widower and which was so painful to Elisabeth, had to be retracted on closer investigation. The character of the young man remained untarnished; it was merely a misunderstanding, an easily conceived difference of opinion concerning the valuation of money that could arise between the merchant, to whom money is only a working tool, and the official—that is all there was to this seemingly so painful incident. I begged the mother to give Elisabeth all explanations that she might hereafter need, and to offer her in the future that opportunity for unburdening her mind to which I had accustomed her.

Naturally I was also anxious to know what chance there was for the fulfilment of the girl's present conscious wish. Here things were less favourable! The mother stated that for some time she had had an inkling of Elisabeth's affections for her brother-in-law, of course she did not know that it had existed during the lifetime of her sister. Whoever saw them both in friendly intercourse—of late, to be sure, only seldom—could entertain no doubt of the girl's anxiety to please him. However neither she, the mother, nor the advisers of the family showed any particular inclination to bring about a matrimonial union between the two. The health of the young man had not been very good and had received a setback through the death of his beloved wife, and it was not at all certain that he had sufficiently recovered from the shock to enter into a new marriage. It was quite probable that this was the reason for his reserve, perhaps also because he was not sure of his position and wished to avoid all obvious gossip. With such a reserve on both sides the solution for which Elisabeth was yearning was likely to fail.

I informed the girl of everything that I had heard from her mother and had the satisfaction of seeing her benefited by the explanation concerning the money affair. On the other hand I urged her to bear calmly the uncertainties of her future which could not be dismissed. The advancing summer forced us to bring the treatment to an end. She now felt better and since we had discussed the causes to which the pain could be traced she no longer complained of pain. We both felt that the work had been finished, although I felt that the ab-reaction of the suppressed love was really not as com-

impression on her She thought how affectionately he cared for her how they understood each other by a mere glance and how sure they seemed to be of each other It was truly regrettable that the second pregnancy followed so closely upon the first her sister knew that this was the cause of her suffering but how willingly she endured it and all because he was the cause of it The brother in law did not at first wish to participate in the walk which was so intimately connected with Elisabeth s pain he preferred to remain home with his sick wife but the latter urged him with a glance to go because she thought that it would give Elisabeth pleasure Elisabeth remained with him throughout the whole walk they spoke about the most varied and intimate things she found herself in thorough accord with all he said and she became overwhelmed with a desire to possess a man like him This was followed by a scene a few days later when on the morning after their departure she visited the point commanding the beautiful view which had been their favourite walk There she seated herself upon a stone and a ain dreamed of her sister s happiness and of a man like her brother in law who could engage her affections When she arose she had pains which again disappeared and only in the afternoon after having taken the warm bath did they reappear remaining ever since I attempted to investi ate the thou hts which occupied her mind while taking the bath but all I could obtain was that the bathroom recalled her absent sister because she had lived in the same house

For some time the state of affairs must have been clear to me The patient seemed absorbed in painfully sweet recollections so that she was wholly unconscious of the drift of her thoughts and continued to reproduce her reminiscences She spoke of the time in Gastein the worry connected with the expectations of the letter finally the information of her sister s illness the long wait until the evening when she could finally leave Gastein the journey with its tormenting uncertainties during a sleepless night—all these remarks were accompanied by a violent aggravation of the pain I asked her if during the journey she thought of the sad possibility which she afterward found realized She answered that she carefully avoided the thought but that in her opinion her mother expected the worst from the very beginning This was followed by the reminiscences of her arrival in Vienna—the impressions which she received from the relatives at the station the short journey from Vienna to the neighbouring summer resort where her sister lived the arrival in the evening the hasty walk through the garden to the door of the little garden pavilion—the silence in the house the oppressive darkness the fact of not having been received by the brother in law She then recalled standing before the bed seeing the deceased and in the moment of the awful certainty that the beloved sister had died without having taken leave of them and without having her last days eased through their nursing—in that very moment another thought flashed through Elisabeth s brain which now peremptorily repeated itself The thought which flashed like dazzling lightning throu h the darkness was Now he is free again and I can become his wife

Of course now everything was clear The analyst s effort was richly repaid The ideas of *defence* against an unbearable idea the origin of hysterical symptoms through conversion of psychic into physical excitement the formation of a separate psychic group by an act of the will which led to the defence—all these were in that moment palpably presented before my eyes Thus and thus alone did things happen here This girl entertained an affectionate regard for her brother in law against the acceptance of which into her consciousness her whole moral being strug led She succeeded in *sparing herself the painful consciousness* that she was in love with her sister s husband by creating for herself instead bodily pains and at the moment when this certainty wished to thrust itself into her consciousness (while sh walked with him during that morning reverie in the bath and before her sister s bed) her pains originated through a successful conversion into the somatic At the time she came under my care the isolation from her awareness of the group of ideas referring to this love affair had already been accomplished else I believe that she would never have agreed to thi mode of treatment The resistance with which she repeatedly opposed the reproduction of the traumatically effective scenes really corresponded to the energy with which the unbearable idea had been crowded out from the associations

For the therapist there now came a sorry time The effect of the resumption of that repressed idea was crushing for the poor child When I summed up the whole situation with these prosaic words You were really for a long time in love with your brother in law she complained of the most horrible pains she

with the hundred different tasks of nursing which succeed each oth r continuously for weeks and month gets into the hab t on the o e hand of suppressi g all signs of his own emotions, and o the oth r hand his atte tion is soon turned away f om hi own impressio s because he has ne ther the time nor the strength to do them j st ce Thus the nurse accum lates in himself an overabundance of fecti e impres ns whi h he o she barely perce es clea ly e o gh at any rate they are ot di.spated by ab reaction that is he or she creates fo himself the material for a *re en o hysteria.* If th patient reco ers these impressi s nat rally lose their alue but if he dies and ne goes into a period f mourning during which only that which refers t the deceased seems f alue the mpres io s wait m, f discharge appear in t rn a d after a brief pause of exhau tio the hysteria the germ of which originated during the nursing bursts f rth.

The same f ct f subsequent djustment to traumas accumulated during nurs ng s occa sionally al.o en ount red where the general impre of being sick doe not e sue but where the m hanism of hysteria evertheless can be n ticed Thus I ha kn wn a h hly gifted b t slightly nervous lady who e whol perso ality suggests th hyst ric yet h ne er becam a b rden to th d tor and was ne r f ed t interrupt the exe cise of h dut es. This lady had nursed three o f ur of h r de r o es until they died which cau d h e h tim a complete phys al exhaustio y t these sad d ties ha e r mad her L How eve hortly ft the death f the pat ent she beg he work f rep oduction in which sh re ews th s enes f the dise e and of the de th. plete as it should have been I regarded her as cured and urged her to continue independently the solution after the way had been cleared for it to which she agreed She left with her mother for a summer resort where they were *to join the older sister and her family*

I still have something more to report about the further course of Miss Elisabeth von R s disease A few weeks after our parting I re ceived a despairing letter from her mother in formin me that at the first attempt to draw Eli abeth into a conversation about her love affairs she became very excited and refused to talk *and since then had suffered from violent* pains She was very indignant at my having betrayed her confidence and was perfectly in accessible so that the treatment seemed a com plete failure She wished to know what was to be done for of me she would hear nothing I made no reply It was to be expected that after she had been relieved from my discipline *she would make another attempt to reject her* mother s interference and return to her re serve I was however quite certain that every thing would adjust itself and that my efforts had not been in vain Two months later they *returned to Vienna and the colleague* to whom I was grateful for the case informed me that Elisabeth was perfectly well and that her be haviour was normal although occasionally she had slight pains Since then she has repeatedly sent me similar messages each time promising to visit me which she has never done This is quite characteristic of the personal relation *ship formed during such treatment My col* league assured me that she could be considered cured The relation of the brother in law to the family had not been changed

In the spring of 1894 I was informed that *she would be present at a private ball to which* I could gain access I did not let the oppor tunity escape me and saw my former patient gliding along in a rapid dance Since then fol lowing her own inclination she married a *stranger*

EPICRISIS

I have not always been a psycho therapist but like other neuro pathologists I was edu cated *to methods of focal diagnoses* and elec trical prognosis so that even I my elf am struck by the fact that the case histories which I am writing read like novels and as it were dispense with the serious features of the scien tific character Yet I must console myself with the fact that the nature of the subject is ap parently more responsible for this issue than my own predilection Focal diagnosis and elec trical reactions are really not important in the study of hysteria whereas a detailed dis cussion of the psychic processes as one is wont *to hear it from the poet* and the application of a few psychological formulæ allows one to gain an insight into the course of events of hysteria Such case histories should be con sidered like psychiatrical ones but they have the advantage over the latter in the fact that they give the intimate connection between the history of the disease and the morbid symp *toms a thing for which we are still looking in* vain in the histories of other psychoses

With the description of the treatment I en deavoured to interweave the explanations which I gave about the case of Miss Elisabeth von R and it will perhaps not be superfluous to sum marize here the essential features I have dis cussed the character of the patient and the *features which repeat themselves in o many* hysterics and which we really cannot consider as degenerative I mentioned the talent the ambition the moral sensitiveness the immense yearnin for love which found its gratification *in the family the independence of her nature* reaching beyond the womanly ideal which manifested itself largely in obstinacy pug naciousness and shut in ness According to the information of my colleague no hereditary taints could be shown on *either side of the* family Her mother to be sure suffered for years from some indefinite neurotic depression but her brothers and sisters her father and his family belonged to the even tempered and not to the nervous type *There was no serious case* of psychosis in any near relatives

Her nature was influenced by painful emo tions the foremost of which was the debili tating influence of a long attendance upon her beloved sick father

That nursing of the sick plays such a signi ficant role in the histories of hysterias has its good reasons A number of effective factors which one finds here are quite obvious thus *the disturbance of the physical health through* interrupted sleep neglect of nourishment and the reaction of a constantly gnawing worri ment on the vegatative functions The most im portant factor however is in my estimation to *be found elsewhere He whose mind is occupied*

To be sure I can give no directions as to how one can produce in himself such a conversion. Apparently it is not done as one intentionally performs an arbitrary action; it is a process which takes place in a person under the impulse of the motive of defence if he has a tendency for it in his organization or if it is brought about by temporary modifications.

One has the right to examine the theory more closely and ask: What is it then that becomes transformed into physical pains? The cautious reply will be: Something out of which psychic pains could have and should have been formed. If one wishes to venture further and attempt a kind of algebraic formulation of the ideational mechanism, one might perhaps attribute to the ideational complex of this desire (which remained unconscious) a certain amount of affect and designate the latter quality as the thing converted. A direct deduction of this conception would be that through such conversions the unconscious love forfeits so much of its intensity that it becomes reduced to a weak idea, and its existence as a separate psychic group is made possible only through this weakening. However, the present case is not capable of throwing light on this delicate matter. It probably corresponds only to an imperfect conversion. From other cases it seems quite probable that there are also perfect conversions, and that in these the unbearable idea actually becomes *repressed* as only an idea of very little intensity could be repressed. After an associative union has been reestablished the patients assure us that since the origin of the hysterical symptoms their unbearable ideas had never occupied their minds.

I have stated above that on certain occasions, though only transitorily, the patient consciously recognized the love for her brother-in-law. Such a moment occurred when, for example, at the deathbed of her sister the thought flashed through her mind: "Now he is free and I can become his wife." I must discuss the significance of these facts for the conception of h[...]

[...] moments should have occurred. For consciously one really does not know in advance when such an unbearable idea will present itself. For the unbearable idea which is later excluded with its appendage for the formation of a separate psychic group must have been originally in the mental activity, else there would have been no conflict to lead to its exclusion. Just such moments should be designated as *traumatic*. It is in them that the conversion takes place and results in the splitting of consciousness and the hysterical symptoms. Everything tends to show that in Miss Elisabeth von R. there were a number of such moments (the scenes of the walking, morning meditation, bath, and at the bedside of her sister), and perhaps new moments of this kind also occurred during the treatment. The multiplicity of such traumatic moments is made possible by the fact that an experience similar to the one which first initiated the unbearable idea [...] and flared up idea, and must later restore the former state through new conversions. Miss Elisabeth, who was in constant relation with her brother-in-law, must have been particularly exposed to the appearance of new traumas. A case whose traumatic history has been finished in the past would have been more desirable for this discussion.

I must now occupy myself with the point which I have designated as a difficulty for the understanding of this case history. On the analytical basis I assumed that the first conversion took place in the patient while she nursed her father, at the time when her duties as a nurse came into conflict with her erotic yearnings, and that this process was the model for the later ones which led to the outbreak of the disease in the Alpine spa. But according to the patient's statement she had *not at all suffered from any pains and weakness* at the time of the nursing and the period following it, which I designated as the *first period*. To be sure, during the illness of her father she was once bedridden for a few days with pains in her leg, but it is doubtful whether this attack already belonged to the hysteria. A causal relation between these first pains and any psychic impressions could not be demonstrated by analysis; it is possible, even probable, that at that time we dealt with a common rheumatic muscular pain. But if we should assume that this first attack of pain was the result of an hysterical conversion in consequence of the rejection of erotic thoughts which then existed, the fact nevertheless remains that the pains

It is different in hypnoid hysteria. Here the content of the separate psychic group may [never] have been in the ego consciousness.

the personal predisposition for the lady whom I have here in mind showed it in the most prolific manner

I now return to Miss Elisabeth von R While nursing her father there occurred for the first time an hysterical symptom in the form of a pain in a definite location on the right thi h The mechanism of this symptom is fully ex plained on an analytic basis It occurred in a moment during which the ideas of her duties towards her sick father came into conflict with the content of her erotic yearning which she then entertained Under vivid self reproach she decided in favour of the former and created for herself the hysterical pain According to the conception explained by the theory of conver sion in hysteria the process could be described as follows She repressed the erotic idea from her consciousness and changed the sum of the affect into somatic sensations of pain Whether this first conflict occurred only once or re peated itself is not clear The latter is more probable Quite a similar conflict—of a higher moral significance and even better demon strated by the analysis—repeated itself after years and led to the aggravation of the same pain and to its dissemination beyond its origi nal limits Again it was an erotic idea which came into conflict with all her moral concep tions for her affection for her brother in law both during the life and after the death of her sister and the thought that she should yearn just for this man was very disagreeable to her This analysis gives detailed information about this conflict which represents the pivotal point in the history of her malady The patient s affection for her brother in law might have be gun to germinate long ago but in favour of its development was the physical exhaustion from the recent nursing and her moral exhaus tion from years of disillusionment which then began to break down her reserve and caused her to confess to herself the need of the love of a man During a relationship which extended over weeks (in that summer resort) this erotic desire attained full development simultaneously with the pain and analysis shows that during that time the patient was in a special psychic state which in conjunction with the desire and pain seems to afford an understanding of the process in the sense of the conversion theory

I must place reliance on the statement that the patient s affection for her brother in law intensive as it was was not *clearly known* to her except on certain rare occasions and then only momentarily If that were not so she would have become conscious of the incompati bility between this desire and her moral ideas and would have had to endure the same mental agonies which I saw her suffer after our anal ysis Her reminiscences gave us no information concerning such suffering (the e she spared herself) and as a result the love itself did not become clear to her At that time as well as during the analysis her love for her brother in law existed in the form of a foreign body in her consciousness without entering into any re lationship with her other ideation In reference to this love there exi ted the peculiar condi tion of knowing and simultaneously not know ing it was the condition of the split-off psychic group When we assert that this love was not *clearly known* to her we mean exactly what we say We do not mean a lower quality or a lesser degree of consciousness but a separation of the free associative mental process from the rest of the ideational content

How did it happen that such an intensively accentuated group of ideas could be kept so isolated? For generally the rôle of an idea in the associations actually increa es with the size of its affect

This question can be answered if we take into account two facts which we can use as if proven (1) That the hysterical pain originated simultaneously with the formation of these separate psychic groups (2) that the patient exerted great resistance against the attempt to bring about the association between the sep arate psychic groups and the rest of the con [illegible] was

these two factors w [illegible] ting of consciousness by asserting that (2) con tains the indication of the *motive* for the split tin of consciousness while (1) shows the *mechanism* of the same The motive was that of *defense* or the striving of the whole ego to get into harmony with this ideation group and the mechanism was that of *conversion* that is instead of psychic pains which she pared her self there appeared physical pains A transfor mation was thus initiated which resulted in a *gain* insofar as the patient had escaped an un bearable psychic state to be sure this gain was obtained at the cost of a psychic anomaly a splitting of consciou ness and physical suffer ing the pains upon which an astasia abasia was constructed.

To be sure I can give no directions as to how one can produce in himself such a conversion. Apparently it is not done as one intentionally performs an arbitrary action it is a process which takes place in a person under the impulse of the motive of defense if he has a tendency for it in his organization or if it is brought about by temporary modifications.

One has the right to examine the theory more closely and ask What is it then that becomes transformed into physical pains? The cautious reply will be Something out of which psychic pains could have and should have been formed. If one wishes to venture further and attempt a kind of algebraic formulation of the ideational mechanism one might perhaps attribute to the ideational complex of this desire (which remained unconscious) a certain amount of affect and designate the latter quality as the thing converted. A direct deduction of this conception would be that through such conversion the "unconscious love" forfeits so much of its intensity that it becomes reduced to a weak idea and its existence as a separate psychic group is made possible only through this weakening. However the present case is not capable of throwing light on this delicate matter. It probably corresponds only to an imperfect conversion. From other cases it seems quite probable that there are also perfect conversions and that in these the unbearable idea actually becomes repressed as only an idea of very little intensity could be repressed. After an associative union has been reestablished, the patients assure us that since the origin of the hysterical symptoms their unbearable ideas had never occupied their minds.

I have stated above that on certain occasions though only transitorily the patient consciously recognized the love for her brother-in-law. Such a moment occurred when at the death bed of her sister the thought flashed through her mind, Now he is free and I can become his wife. I must discuss the significance of these factors for the conception of the whole neurosis. However I think that in the assumption of a defense hysteria there is already the requisite that at least one such moment should have occurred. For consciousness really does not know in advance when such an unbearable idea will present itself. For the unbearable idea, which is later excluded with its appendage for the formation of a separate psychic group must have been originally in the mental activity else there would have been no conflict to lead to its exclusion. Just such moments should be designated as traumatic. It is in them that the conversion takes place and results in the splitting of consciousness and the hysterical symptoms. Everything tends to show that in Miss Elisabeth von R there were a number of such moments (the scenes of the walking morning meditation, bath, and at the bedside of her sister) and perhaps new moments of this kind also occurred during the treatment. The multiplicity of such traumatic moments is made possible by the fact that an experience similar to the one which first initiated the unbearable idea, introduces new emotions to the separated psychic groups and thus transitorily abolishes the success of the conversion. The ego is forced to occupy itself with this suddenly reinforced and flared up idea and must later restore the former state through new conversions. Miss Elisabeth, who was in constant relation with her brother-in-law must have been particularly exposed to the appearance of new traumas. A case whose traumatic history has been finished in the past would have been more desirable for this discussion.

I must now occupy myself with the point which I have designated as a difficulty for the understanding of this case history. On the analytic basis I assumed that the first conversion took place in the patient while she nursed her father at the time when her duties as a nurse came into conflict with her erotic yearnings and that this process was the model for the later ones which led to the outbreak of the disease in the Alpine pa. But according to the patient's statement she had *not at all suffered from any pains and weakness* at the time of the nursing and the period following it which I designated as the *first period*. To be sure, during the illness of her father she was once bedridden for a few days with pains in her legs, but it is doubtful whether this attack already belonged to the hysteria. A causal relation between these first pains and any psychic impressions could not be demonstrated by analysis it is possible even probable that at that time we dealt with a common rheumatic muscular pain. But if we should assume that this first attack of pain was the result of an hysterical conversion in consequence of the rejection of erotic thoughts which then existed, the fact, nevertheless remains that the pains

I is d. eren in hypnoid hysteria. Here the content of the separate psychic group may never have been in the ego consciousness.

disappeared after a few days so that the patient actually behaved differently than she seemed to show during the analysis During the reproduction of the so called first period all her statements concerning the illness and death of her father the impressions relating to her first brother in law etc all these were accompanied by manifestations of pain while at the time she really experienced these impressions she felt no pains Is this not a contradiction which is likely to diminish considerably the confidence in the explanatory value of such an analysis?

I believe that I can explain the contradiction by assuming that the pains—the product of the conversion—did not originate while the patient experienced the impressions during the first period but subsequently that is in the second period when the patient reproduced these impressions in her mind The conversion did not follow the fresh impressions but the memories of the same I even believe that such a process is not at all unusual in hysteria and regularly participates in creating hysterical symptoms Nevertheless as such an assertion does not seem plausible I shall attempt to make it more credible by citing other experiences

During a similar analysis it once happened that a new hysterical symptom was formed during the treatment so that I could attempt its removal on the day after its origin

I will describe the essential features of the history of this patient They are simple but not without interest

Miss Rosalia H twenty three years old who for a number of years made great efforts to educate herself as a singer complained that her beautiful voice did not obey her in certain notes She felt choking and tightening sensations in the throat so that the tones sounded strained and her teacher could therefore not yet permit her to appear in public Although this imperfection affected only her middle notes it could not be explained on the basis of a defect of her vocal organs for at times this disturbance did not show itself and her teacher was very pleased with her but at other times the slightest excitement seemingly without provocation evoked the choking sensation and prevented free expansion of the voice It was not difficult to recognize in this annoying *sensation an hysterical* conversion Whether there was really a contracture of certain muscles of the vocal chords could not be verified In the hypnotic analysis which I undertook with this girl I found out the following concerning her vicissitudes and the ailments occasioned through them She became an orphan at an early age and was brought up by her aunt who had many children and she had to share the life of a most unfortunate family existence The *husband of this aunt seemingly* a pathological personality abused his wife and children in the most brutal manner and what especially pained her was his unconcealed sexual preference for the servant and nurse girls in the house This became even more obnoxious as the children grew older When her aunt died Rosalia became the protectress of the orphaned children who were harassed by their father She took *her duties seriously fought* through all conflicts and had to exert her greatest efforts to suppress the manifestations of her contempt for her uncle It was then that the choking sensation in her throat originated. Whenever she was compelled to swallow an affront whenever she had to remain silent on hearing a provoking accusation she perceived a scratching in her throat the tightening and failure of her voice in brief she had all the localized sensations in her larynx and pharynx which now disturbed her in singing It was conceivable that she sought the possibility of making herself independent in order to escape the excitement and the painful impressions which were daily occurrences in her uncle s house An efficient music teacher took an unselfish interest in her assuring her that her voice entitled her to choose the profession of singing She began secretly to take lessons of him and because she often went for her lessons with the choking sensation in her throat following some violent scene in the house a connection was formed between the singing and the hysterical paresthesia for which a way was prepared by the sensitiveness of the vocal organs during singing The apparatus of which she should have had free control was filled

I h d u d bs rv t th case f wh h t t f th m t rs m d t impos bl f

with the remnants of innervation from those numerous scenes of suppressed excitement. Since then she has left her uncle's house and has moved to another city so as to be away from the family, but her ailments were not benefited by it. No other hysterical symptoms were discovered in this pretty and unusually bright girl.

I endeavoured to cure this *retention hysteria* by a reproduction of all the exciting impressions and by subsequent ab-reaction. I afforded her the opportunity of railing against her uncle in long speeches and of telling him the bare truth to his face, etc. The treatment benefited her but unfortunately she lived here under quite unfavorable conditions. She had no luck with her relatives. She was the guest of another uncle who treated her with friendliness, but just for that reason she incurred the displeasure of her aunt. The latter believed that her husband evinced too marked an interest in his niece and made it a point of opposing the girl's stay in Vienna. She herself in her youth was obliged to relinquish a desire of becoming an artist and was now jealous of her niece because she had the opportunity to develop her talent, not considering that it was not mere desire but a wish to become independent which led her niece to take this step. Rosalia felt so uncomfortable in the house that she, for instance, did not dare to sing or play the piano when her aunt was within hearing distance, and carefully avoided either singing or playing anything for her aged uncle—her mother's brother—whenever her aunt was home. While I was endeavouring to efface the traces of the old excitements new ones originated through these relations with her host, and finally interfered with the success of my treatment and prematurely interrupted the cure.

One day the patient came to me with a new symptom hardly twenty-four hours old. She complained of a disagreeable prickling sensation in the fingertips which had manifested itself every few hours since the day before and forced her to make very peculiar jerky movements. I could not see the attack, otherwise I would have guessed the cause from seeing the motions of the fingers, but I immediately endeavoured to trace through hypnotic analysis the causation of this symptom (it was really a minor hysterical attack). As the whole thing existed only for a short time I hoped to be able to explain it and quickly remove it. To my surprise she reproduced, without any hesitation in chronological order, a whole row of scenes beginning in her early childhood. All these had perhaps the same characteristics in the fact that she had suffered an injustice without defense, something which could make her fingers jerk, for example, scenes like the one of being forced to hold out her hand in school while the teacher struck it with a ruler. But they were all banal causes, to which I would have gladly opposed the right to enter into the aetiology of hysterical symptoms. It was different, however, with one scene of her early girlhood which was connected with the others. The bad uncle who suffered from rheumatism asked her to massage his back. She did not dare refuse him. He was in bed while she was doing it and he suddenly threw off the covers, jumped up and attempted to grab her and throw her down. She naturally stopped the massage and in a moment escaped and locked herself in her own room. She evidently did not like to recall this experience and could not say whether she had seen anything when the man suddenly exposed himself. The sensations in the fingers could be explained as due to the suppressed impulse to punish him, or it might simply have originated from the fact that she was at that time massaging him. Only after this scene did she begin to talk about the one which she experienced yesterday, after which the sensitiveness and jerkiness of the fingers appeared as a recurring memory symbol. The uncle with whom she now lived begged her to play something for him. She sat at the piano and accompanied herself singing, believing that her aunt was out. Suddenly she appeared in the doorway. Rosalia jumped up, closed the piano and flung away the sheet of music. We can guess what memories came to her mind, and the train of thought which she tried to ward off at that moment, for the exasperation brought on by the unjust accusation should have really urged her to leave the house, but on account of her illness she was forced to remain in Vienna and had no other shelter. The movement of the fingers which I saw during the reproduction of this scene resembled a continuous jerking, as if one literally and figuratively would reject something like throwing away a sheet of music or rejecting an unreasonable demand.

She was quite positive in her assurance that she did not perceive the symptom before that, it was not caused by the scenes previously related. Was there anything else to be assumed except that the scene experienced yesterday had in the first place awakened the recollection

of a former similar content and that it then developed into a memory symbol for the whole group of recollections? The conversion was on the one hand furnished with newly experienced affects and on the other with recollected affects

When we consider this state of affairs we must admit that in the origin of hysterical symptoms such a process is the rule rather than the exception Whenever I seek for the determinants of such states I frequently find not a single but a group of similar traumatic motives In some of these cases it could be ascertained that this particular symptom had already existed for a short time after the first trauma and then subsided but reappeared after the next trauma and became fixed Yet no real distinction can be made between those of temporary appearance and those which remained entirely latent causations In a large majority of cases it was also found that the first trauma had left no symptoms while a later trauma of the same kind produced a symptom for the origin of which the cooperation of the former motives could not be dispensed with and for the solution of which it required a consideration of all the motives Translating this into the language of conversion theory this undeniable fact of the summation of traumas and the erstwhile *latency* of the symptoms simply means that the conver

seems to exist in the history and analysis of Miss Elisabeth von R.

For there is no question that normal per*sons continue to carry in their* consciousness a large number of ideas with unadjusted affects The assertion which I have just defended merely approximates the behaviour of hysteria to that of the normal It is apparently reduced to a quantitative factor it is simply a question of *how many* such affective strains an organization can endure Even an hysterical person will be able to retain a certain amount in an adjusted state but if through a summation of similar motives it increases beyond the individual s endurance the impetus for conversion is formed It is therefore no singular theory but almost a postulate to say that the formation of hysterical symptoms may also be brought about at the cost of recollected affects

I have now occupied myself with the *motive* and *mechanism* of this case of hysteria it still remains to discuss the *determination* of the hysterical symptoms Why should just the pains in the legs have been selected to represent the psychic pains? The circumstances of the case point to the fact that this somatic pain was not created by the neurosis but was merely utilized aggravated and retained by it I will add that in most of the cases of hysterical algias into which I have been able to gain an insight the conditions were similar that is there was to begin with always a real organically founded pain It is always the most common the most widespread pain of humanity that seem to be most frequently called upon to play a part in hysteria Among the most common are the periosteal and the neuralgic pains of the teeth headaches which originate from so many different sources and not in a lesser degree the so often mistaken rheumatic pains of the muscles The first attack of pain which Miss Elisabeth von R had while she nursed her father I consider to have been organically determined for I received no information when I investigated for its psychic motive and I admit that I am inclined to attribute differential diagnostic significance to my methods of evoking hidden memories if they are carefully applied This original rheumatic pain became the memory symbol for her painful psychic excitements and as far as I can see for more than one reason First and principally because it existed in consciousness almost simultaneously with the other excitements and second because it was or could be connected in many ways with the ideation content of that time At all events it was per*haps a remote consequence of the nursing* of her want of exercise and of the poor nutrition entailed by her duties But this hardly became clear to the patient and what is more important is that she had to perceive it during important moments of the nursing as for example when she jumped out of bed in the cold room to respond to her father s call Even more decisive for the direction taken by the conversion must have been the other manner of associative connection namely the fact that for many days one of her painful legs came in contact with the swollen leg of her father during the changing of the bandages The location on the right leg distingui hed by this contact henceforth remained the focus and *starting point* of the pains it was an artificial

Compar h e th ce amples of Mrs. Emmy in case II of *St d b r Hyster* 1895

B t pe haps p oal n rasthe l ?

hysterogenic zone, the origin of which can be plainly seen in this case.

If anyone should be surprised at the associative connection between physical pain and psychic affect, thinking it to be too manifold and artificial, I would answer that such surprise is just as unfair as to be surprised over the fact that just the richest people in the world possess most of the money. Where profuse connections do not exist there is naturally no formation of hysterical symptoms and conversion does not find its way. I can also state that, in reference to determinations, the case of Miss Elisabeth von R belongs to the simpler ones. In the case of Mrs. Cecilia M particularly I had to solve the most intricate knots of this kind.

I have already discussed in the case history how the astasia abasia of our patient was built up on those pains after a definite path was opened to the conversion. But there too I have expressed the opinion that the patient created or aggravated the disturbance of function through symbolization. For her dependence and helplessness to change anything in the circumstances she found a somatic expression in the astasia-abasia, and the expressions "to make no headway," "to have no support," etc., formed the bridge for this new act of conversion. I will endeavour to support this conception by other examples.

Conversion on the basis of coincidence in otherwise existing associative connections seems to exert the least claims on the hysterical predisposition. On the other hand, conversion through symbolization seems to require a higher grade of hysterical modification, a fact also demonstrated in Miss Elisabeth von R in the later stages of her hysteria. The nicest examples of symbolization I have observed in Mrs. Cecilia M whom I can call my most difficult and most instructive case. I have already mentioned that unfortunately this case history does not lend itself to detailed reproduction.

Among other things Mrs. Cecilia M also suffered from a most violent facial neuralgia which appeared suddenly two or three times during the year and persisted for from five to ten days resisting every remedy and then ceased as if cut off. It limited itself to the second and third branches of the trigeminus, and as there was undoubtedly an excess of urates in the urine and as a ... acute rheumatism played a certain part in the patient's history it was reasonable to assume that we dealt with a gouty neuralgia. This opinion was also shared by the consulting physicians who saw every attack. The neuralgia was treated by the methods in vogue such as electric penciling, alkaline waters and purgatives, *but it always remained uninfluenced* until it found it convenient to make room for another symptom. In former years—the neuralgia was fifteen years old—the teeth were accused of preserving it and were condemned to extraction, and one fine morning under narcosis the execution of seven of the culprits took place. This did not run so smoothly as the teeth were so firm that most of the roots were left behind. This cruel operation was followed by neither temporary nor permanent relief. At that time the neuralgia raged for months. Even while under my care whenever she had neuralgia, the dentist was called and he always declared he found diseased roots. He started to get ready for an extraction but usually he was soon interrupted, for the neuralgia suddenly ceased and with it the desire for the dentist. During the intervals the teeth did not ache at all. One day just while another attack was raging I put the patient into a hypnotic condition and placed an energetic interdiction on the pains, and from that moment they ceased. I then began to doubt the genuineness of this neuralgia.

About a year after this hypnotic remedial success the condition of Mrs. Cecilia M took a new and surprising turn. There suddenly appeared other states than those that had been characteristic of the last years, but after some reflection the patient declared that all these conditions had existed before and were really scattered over the long period of her disease (thirty years). Indeed a surprising abundance of hysterical incidents were unrolled which the patient was able to localize correctly in the past, and soon the frequently very entangled mental connections which determined the sequence of these incidents became recognizable. It was like a series of pictures with an explanatory text. Pitres in describing his *délire ecmnésique* must have had in mind a similar case. The way such an hysterical condition belonging to the past was reproduced was

[illegible]

try ... about ten years ago.—Tr.

A delirium in which the events of a period of time are forgotten although prior events are remembered.—Ed.

most remarkable In the first place while the patient was in the best of condition there appeared a pathological mood of special colouring which was regularly mistaken by the patient and was referred to a banal occurrence of the last hours This increasing obnubilation of consciousness was followed by hysterical symptoms such as hallucinations pains convulsions and long declamations and finally an event of the past attached itself to this hallucinatory manifestation which could explain the initial mood and determine the occasional symptoms With this last part of the attack lucidity returned the symptoms disappeared as if by magic and good health again existed—until the next attack which was half a day later Usually I was called at the height of this condition I induced hypnosis evoked a reproduction of the traumatic events and by artificial aid I curtailed the attack Having gone through with the patient many hundreds of such cycles I obtained the most instructive explanations concerning the determinants of hysterical symptoms The joint observation with Breuer of this remarkable case was also the chief motive for the publication of our Preliminary Communication

In this connection it finally also came to the reproduction of the facial neuralgias which I myself had still treated as actual attacks I was desirous of knowing whether we would find here a psychic causation When I attempted to evoke the traumatic scene the patient soon imagined herself in a period during which she felt marked psychic sensitiveness against her husband She related a conversation with him and a remark that he made which annoyed her very much *She then suddenly grasped her* cheek crying aloud with pain and said That was like a slap in the face With this both the attack and the pain came to an end

There is no doubt that here too we dealt with a symbolization She had felt as if she really received a slap in the face Now everybody will ask how the sensation of a slap in the face can lead to the manifestation of a trigeminal neuralgia to its limiting itself to the second and third branches and to its being aggravated on opening the mouth and on mastication (not on talking)

The following day the neuralgia reappeared but this time it could be solved by the reproduction of another scene the content of which equally showed a supposed insult This process continued for nine days and from the result it seemed that for years irritations especially through words produced new attacks of this facial neuralgia by way of symbolization

But finally we also succeeded in reproducing the first attack of the neuralgia which occurred more than fifteen years before Here there was no symbolization but a conversion through coincidence It was a painful sight which recalled to her mind a reproach and this caused her to repress another series of thoughts We had here then a case of conflict and defense and the origin of the neuralgia in this moment could not be further explained if we did not wish to assume that she suffered at that time from slight toothache or facial pains a thing not improbable as she was then in the first months of pregnancy

The result of the explanation showed that this neuralgia became the mark of a definite psychic excitement through the usual road of conversion but that it could be awakened later through associative accusations from mental life and symbolic conversions It was really the same procedure as we encountered in Miss Elisabeth von R

I will now introduce another example which will illustrate the efficacy of symbolization under other determinants On one occasion Mrs Cecilia M was tormented by a violent pain in her right heel she had stinging sensations on every step which made walking impossible The analysis conducted us to a time when the patient was in a foreign sanitarium For eight days she kept to her room and for the first time the house physician was to take her to the dining room The pain came on while the patient took the physician s arm on leaving the room It disappeared during the reproduction of this scene while she remarked *that at that* time she feared lest she would not make the proper impression on this strange society ***rechte Auftreten*** equals ***proper stepping***

This seems a striking almost comical example for the origin of hysterical symptoms through symbolization by means of a verbal expression But closer investigation of the circumstances of that moment favours another conception The patient suffered at that time from actual pains in her feet on account of which she remained in bed and we can only assume that the fear which obsessed her on taking the first steps produced from the simultaneously existing pains the one symbolically appropriate symptom in the right heel in order to form it into a psychic algia and to assist it to maintain itself for a long time

Notwithstanding the fact that the mechan

ism of symbolization in these examples seems to be pushed into second rank, which certainly agrees with the rule I have still other examples at my disposal which seem to demonstrate the origin of hysterical symptoms through symbolization only One of the best is the following example which again refers to Mrs. Cecilia M. At the age of fifteen she once lay in bed watched by her austere grandmother The girl suddenly cried out, complaining of having perceived a pain in the forehead between the eyes which thereafter continued for weeks On analysing this pain, which was reproduced after almost thirty years she stated that her grandmother gazed at her so piercingly that it seemed as if her look penetrated deeply into her brain. She was really afraid of being looked upon suspiciously by this old lady On repro-

c

t

which in a way stands midway between the mechanism of *auto-suggestion* and that of *conversion*

The study of Mrs Cecilia M gave me the opportunity to gather a collection of such symbolizations A whole series of physical sensations, which were otherwise looked upon as organically determined, were of psychic origin or at least lent themselves to psychic interpretation. A certain number of her experiences were accompanied by a piercing sensation in the region of the heart (I felt a stitch in my heart) The piercing headache of hysteria was

the hysterical ... in the throat, when it manifested itself during an annoyance ran parallel with the thought I have to swallow that. There was a whole series of parallel running sensations and ideas in which it was now the sensation evoking the idea as an interpretation, and now the idea which produced the sensation by symbolization, and not seldom it remained obscure which of the two elements was the primary one

In no other patient was I able to find such a prolific application of symbolization. To be sure Mrs Cecilia M was quite an unusual person, of a special artistic temperament whose highly developed sense of form manifested itself in producing very beautiful poems I maintain, however that if an hysteric creates through symbolization a somatic sensation for

an emotionally accentuated idea it is due less to individual and arbitrary things than one supposes. When during an *offending harangue* he takes literally such phrases as stitch in the *heart or* slap in the face and perceives them as real occurrences she practises no facetious misuse but only revives the sensations to which these phrases owe their existence. For how does it happen that in speaking of an aggrieved person we use such expressions as "he experienced a stitch in his heart if the mortification was not actually accompanied by a precordial sensation that could be so interpreted and *recognized*? Is it not probable that the phrase to swallow something applied to an unreturned insult really originates from the sensation of innervation appearing in the pharynx when one forces back his speech thus preventing a reaction to the insult? All these sensations and innervations belong to the expres

weakened that their verbal expression seems to us like a figurative transformation but very probably all this was once meant literally and hysteria is justified in reconstructing the original literal sense for its stronger innervation Indeed perhaps it is improper to say that it *creates such sensations through symbolization* perhaps it has not taken the usage of speech as a model but like it draws it from a common source

CHAPTER 4

THE PSYCHO-THERAPY OF HYSTERIA

IN our Preliminary Communication" we have stated that while investigating the aetiology of hysterical symptoms we have also discovered a therapeutic method which we consider of practical significance *We found at first to our greatest surprise that the individual hys*

In conditions of profounder psychic changes we apparently find symbolic stamp of the more ...

both her physicians, Breuer and I were ... in

terical symptoms immediately disappeared without returning if we succeeded in thorough ly awakening the memories of the causal proc ess with its accompanying affect and if the patient circumstantially discussed the process in the most detailed manner and gave verbal expression to the affect (p 26)

We furthermore attempted to explain how our psycho therapeutic method acts *It abro gates the efficacy of the original non ab reacted ideas by affording an outlet to their strangu lated affects through speech It brings them to associative correction by drawing them into normal consciousness (in mild hypnosis) or by eliminating them through medical suggestion in the same way as in somnambulism with amne sia* (p 30)

Although the essential features of this meth od have been enumerated in the preceding pages a repetition is unavoidable and I shall now attempt to show connectedly how far reaching this method is its superiority over others its technique and its difficulties

I

I for my part may state that I can firmly adhere to the Preliminary Communication but I must confess that in the years that have elapsed since then and after continuous occu pation with the problems touched on there new viewpoints obtruded themselves on me as a result of which the former material underwent at least a partial chan e in grouping and con ception It would be unjust to impute too much of the responsibility for this development to my honored friend J Breuer The responsibili ty for the following elucidations therefore rests preponderately upon me

In attempting to use Breuer s method for treating hysterical symptoms in a great num ber of patients by investigation and ab reaction in hypnosis I encountered two obstacles the pursuit of which led me to change the tech nique as well as the conception (1) Not all persons were hypnotizable who undoubtedly showed hysterical symptoms and in whom there most probably existed the same psychic mechanisms (2) I had to take an attitude to wards the question of what essentially charac terizes hysteria and in what it differs from other neuroses [illegible]

it [illegible]

wha [illegible]

tise towards the second problem It is very dif ficult to examine a case of neurosis before it has been subjected to a thorough analysis uch as would result only through the application of Breuer s method But before we have such a thorou h knowledge we are obliged to decide upon the diagnosis and kind of treatment Hence the only thing left to me was to select such cases for the cathartic method which could for the time being be diagnosed as hys teria and which showed some or many stig mata or the characteristic symptoms of hys teria Yet it sometimes happened that in pite of the dia nosis of hysteria the therapeutic re sults were very poor and even the analysis re vealed nothing of importance At other times I attempted to treat cases which no one took for hysteria by Breuer s method and I found that I could influence them and even cure them Such for example was my experience with obsessions the real obsessions of Westphal s type in cases which did not show a single fea ture of hysteria Thus the psychic mechanism revealed in the Preliminary Communication could not therefore be pathognomonic of hys teria Nor could I for the sake of this mechan ism throw so many neuroses into the same pot with hysteria Out of all the instigated doubts I finally seized upon a plan to treat all the other neuroses in question just like hysteria to in vestigate the aetiology and form of psychic mechanisms and to leave the decision for the justification of the dia nosis of hysteria to the outcome of this investigation

It thus happened that proceeding from Breu er s methods I occupied myself mostly with the aetiology and the mechanism of the neuroses. After a relatively brief period I was fortunate in obtaining useful results First I became im pressed with the cognition that if one may speak of a causation through which neuroses would be acquired the aetiolo y must be sought in sexual factors This agrees with the findings that generally speaking various sexual factors may also produce various pictures of neurotic diseases And depending on the amount of con firmation of the latter relation one could now also venture to utilize the aetiology for the characteristics of the neuroses and build up a sharp line of demarcation between the morbid pictures of the neuroses If the aetiological characters constantly agreed with the clinical then this was really justified

In this way it was found that *neurasthenia* really corresponds to a monotonous morbid pic ture in which as shown by analysis *psychic mechanisms* play no part From neurasthenia we sharply di tinguished the compulsion neu

rosis (obse sions, doubts phobias) the neurosis of genuine obsessions n which we can recognize a compl cated psychic mechanism an aetiology resembling th one of hysteria and a far-reachi pos bility of its reduction by psychotherapy On the other hand it seemed to me absolutely imperative to separate from neurasthenia a neurotic symptom complex which depends on a totally di ergent indeed strictly speaking o a contrary a tiology the partial sympt ms of this complex ha e already been recognized by E. Hecker[1] as h ing a common character They are e ther symptom or equiv lents, or rudiments f *anxiety man fe tat ons* and i is for that reaso in order to distinguish this complex from neurasthenia that I have called t *anxiety eurosis* I maintained that it originates f om an accumulatio of physical tension, which is in turn f sexual origin. This neuro too has n psychic mechani m but regularly influ nces the psychic life so that among its regular ma festati ns we have anx i us expectations phobias h pe esthes as to pain, and ther symptoms This anxiety neu osis, as I tak it, certainly corresponds in part t the neurosis called hypoch ndria which in som features resembles hyst ria and n uras h d marcation

lat on to the symptom of us p

After I had thus c nstructed fo myself the simple picture of neura thenia anx ty n u roses, and obsessions, I turned my att tio to the mm nly occurring cases of neuroses which ente into s derati n in the diagno is f hysteria. I ow had t say to myself that it would n t d to m rk n urosi as hysterical on th whole m rely because it symptom c m plex evinced som hysterical features I could readily explain this practi e by th f ct that hysteria is the oldest th most familiar and the m t striking neurosis unde onsiderat n but t wa an buse non theless to put so many characteri tics of perversion and degeneration und r the c ption f hysteria. Whenever an

ould naturally find united und r th same trad mark th worst d most contradictory

features As certain as this diagnosis was incorrect it was also certain that our classification must be made on neurotic li es and as we knew neurasthenia anxiety neuro is, and similar conditions n the pure state, there was no need of overlooking them in combination

It seemed therefore that the followin con ception was more warrantable The neuroses usually occurrin are generally to be des gnated as *mi ed* Neurasthenia and anxiety neurosis can be found without effort in pure forms, and most frequently in young persons. Pure cases of hysteria and compulsion neurosis are rare they are usually comb ned with an anxiety neurosis. This frequent occurrence of mixed neuroses is due to the fact that their aetiological factors are frequently mixed now only accident lly and now in consequence of a causal relation between the processes which give rise to the aetiological factors of the neuroses This can be sustained a d pro en in the indi idual cases without any difficulty But it follows from this that for the purpose of examination it is hardly pos ble to take hysteria out of its association *with the sexual neuroses that hysteria as a* rule presents only one s de one aspect of the complicated neurotic case and that only as it were in the borderline case can it be found and treated as an solated neuros s In a series of cases we can perhaps say *a potiori fit denominatio*

I shall now exami e the cases reported to see wh ther they speak in fa our of my v ew of the clinical dependence of hysteria. Breuer's patient Anna O seems t co trad ct this and emphsie a pure hysterical disease Y t this cas which became so fru tful for the knowl ed e of hysteria was n er co dered by its observe under the guise of a sexual neurosis and hence cannot at present be utilized as such. When I began t analyse the econd pat ent Mrs Emmy von N th dea of a sexual neuro s s o an hyst rical basis was far from my mind I had just returned from the Charcot

[1] E. Hecker *Zentralbl f fur Nervenheilkund* December 893

The me is taken from the tronge aspect.—ED Case I in B eue and Freud, *S udien ber Hy erie*, S 5 [tran la ed by A. A. Brill, Nervous & Mental Disease Pub Co New Y k 936].

The third case Miss Lucie R could perhaps more than any other be called a borderline case of pure hysteria It is a short episodic hysteria based on an unmistakably sexual aetiology which would correspond to an anxiety neurosis in an over ripe amorous girl whose love was too rapidly awakened through a misunderstanding Yet the anxiety neurosis either could not be demonstrated or had escaped me Case IV Katharina is really a model of what I have called *virginal anxiety* it is a combination of an anxiety neurosis and hysteria the former creates the symptoms while the latter repeats them and works with them At all events it is a typical case of many juvenile neuroses called *hysteria* Case V Miss Elisabeth von R was again not investigated as a sexual neurosis I could only suspect that there was a spinal neurasthenia at its basis but I could not confirm it I must however add that since then pure hysterias have become still rarer in my experience That in grouping together these four cases of hysteria I could disregard in the discussion the decisive factors of sexual neuroses was due to the fact that they were older cases in which I had not as yet carried out the intentional and urgent investigation for the neurotic sexual subsoil Moreover the reason for my reporting four instead of twelve cases of hysteria the analyses of which would confirm our claims of the psychic mechanism of hysterical phenomena is due to one circumstance namely that the analysis reveals these cases simultaneously as sexual neuroses though there is no doubt that any diagnostician would have denied them the name *hysteria* However the discussion of such sexual neuroses would have overstepped the limits of our joint publication

I do not wish to be misunderstood and give the impression that I refuse to accept hysteria as an independent neurotic affection that I conceive it only as a psychic manifestation of the anxiety neurosis that I ascribe it to only ideogenous symptoms and that I attribute the somatic symptoms like hysterogenic points and anaesthesias to the anxiety neuroses None of these statements are true I believe that hysteria purified of all admixtures can be treated independently in every respect except in therapy For in the treatment we deal with a practical purpose namely we have to do away with the whole diseased state and if hysteria occurs in most cases as a component of a mixed neurosis the case merely resembles a mixed infection where the task is to preserve life and not merely to combat the effect of one inciting cause of the disease

I therefore find it important to separate the hysterical part in the pictures of the mixed neuroses from neurasthenia anxiety neurosis etc for after this separation I can express concisely the therapeutic value of the cathartic method Similarly I would venture to assert that—principally—it can readily dispose of any hysterical symptom whereas as can be easily understood it is perfectly powerless in the presence of neurasthenic phenomena and can only seldom and only through detours influence the psychic results of anxiety neurosis Its therapeutic efficacy in the individual case will depend on whether or not the hysterical components of the morbid picture can claim a practical and significant position in comparison to the other neurotic components

Still another limitation is placed on the efficacy of the cathartic method which we have already mentioned in our Preliminary Communication It does not influence the causal determinations of hysteria and hence it cannot prevent the origin of new symptoms in the place of those removed Hence on the whole I must claim a prominent place for our therapeutic method in the realm of a therapy of neuroses but I would caution against attaching any importance to it or putting it into practice outside of this connection As I am unable to give here a *therapy of neuroses* as would be required by the practicing physician the preceding statements are put on a level with a deferred reference to some later communication still for purposes of discussion and elucidation I can add the following remarks

1 I do not claim that I have actually removed all the hysterical symptoms which I have undertaken to influence by the cathartic method but I believe that the obstacles were due to the personal circumstances of the cases and not to the general principles In passing sentence these cases of failure may be left out of consideration just as the surgeon puts aside all cases who die as a result of narcosis hemorrhage accidental sepsis etc when deciding upon a new technique Later when I will again consider the difficulties and drawbacks of this method I will again discuss the failures of such origin

2 The cathartic method does not become valueless simply because it is a *symptomatic and not a causal* therapy For a causal therapy is really in most cases only prophylactic it

See p 31 above   See p 38 bo e

..ops the further pro-ress of the injury but it does ot necessarily remove the products which have already resulted from it It requ res as a .e a second agent to olve the latter task, and in cases of h steria the cathartic method is really insurpa..sable for this purpo e

3. Where a period of hysterical production or an acute hysterical paroxysm has been over come, and the nly remnant manifestations left are hysterical symptoms the cathartic method fu..lls all indications and achieves a full and lasti..g success. Such a fa ourable constella tio for the therapy rarely results in the realm of t.. sexual life in o sequence of the ma ked fluctuations in the intens ty of the sexual need and the compu.cations of th equired det rmi nation fo a sexual trauma. Here the cathartic method ccomplishes all that is required of it, for the physician cannot possibly change an hys encal onstit tion. H must rest content if he can remove the disea..e for which such a constitutio shows a tendency and which can arise through th assistance of external deter mi..nts H must be satisfi d f the patient will again be ble t functi n Moreove h need ot despai of th future even if he c nsid rs the pos.ib lit of relapse fo he kn ws the main character f the aetiol gy of the neuroses, namely that thei origin i mostly *overdeter m d* and that many fa tors mu..t cooperat to prod thi result He an hope that this cooperatio will ot take plac ery oon even if som of the et logical fact rs remained in fo ce

It may be argued that in uch subs ded ca..es f hys ria the remaining symptoms would sponta..eousl disappear without anythin else but thi can be answered by st ting that such spo taneous cures ery ften terminat ne ther rapidly fully and that the cu e will be extrao dinarily dva ced by the treatm t. Wh the the cathartic treatment cures nly that which is capabl of spo taneous recovery or incidentally als that which w uld n t cease spontaneously that question may urely be left open f the present

4 Wherever w counte an acut hyst ria during the m t cut prod ction of hysterical symptoms and the consecutive overwh lming of the ego by th m rb d prod cts (hysterical psychosis) even the cathartic method will change littl in the xpres o and course f the disease On finds himself n th sam position t the neurosis as th doct t an cut infec tiou disea Th aetiological f t rs ha e ex erted a sufficie t amount of aff t fo some time past which is now beyond the reach of influence and now that it has passed the in terval of incubation it comes to the surface The affection cannot be warded off it has to run ts course but meanwhile one must brin.. about the most favourable conditions for the patient. If during ch an acute period one can remo e the morb d products the newly formed h sterical symptoms it may be expected that thei places will be taken by new ones The ph .. cian will not be spared the depres ing im pre sion of fruitless effort the enormous e pend ture of exertion and the disappointment of the relat es to whom the idea of the neces sary duratio of time of an acute neurosis is hardly as familiar as in the analogous case of an acute infectious disease these and many ther things will probably largely impede the consequent applicati n of the cathartic method in the assumed case Nevertheless it still re mains to be considered whether even in an acute hysteria the frequent removal of the morb d products does not exercise a curative influence by supporti g the normal e.o whi h s occup ed with the defense and thus prevent ing it from m rging into a psychosis or into ultim te confu. on.

That the cathartic method can accompli.h something even in an acute hysteria and that it can eve reduce the new producti ns of the m b d symptoms qu te pract cally and no- ti eably is undo btedly evident from the ca e of Anna O in which Breuer first learned this p ycho therapeutic method

5 Wh re we d al with chronic pro-res e hysterias with moderate or co tinued produc m thod as a symptomatic remedy We then ha e t d al with an inj ry produced by a chr n cally acting aetiology We ha e to strengthen the capacity of resistance of the r ous system f ou patient, and we must bear in mind that th exi tence f an hysteri cal sympt m gnifies weakening of resist ance f the nervous ystem, and represents a predi..posing facto From the mechanism of mo osymptomatic hysteri we know that new hys rical symptom generally origin tes s an dditio t and as an nalogy of o e already m ..tence Th l cation o c pen trated rep- ese t the weak spot which can be penetrated again. Th lready split-off psychi group plays the part f the p king crystal from which a f rm ly m tted crystallizati n emanates with

great facility To remove the already existing symptoms to do away with the psychic alterations lying at their bases is to return to the patients the full measure of their resistance capacity with which they are successfully able to resist the noxious influences One can do a great deal for the patient by such long continued watchfulness and occasional chimney sweeping

6 I still have to mention the apparent contradiction between the admission that not all hysterical symptoms are psychogenic and the *assertion that they can all be removed by psycho therapeutic procedures* The solution lies in the fact that some of these non psychogenic symptoms though they represent morbid symptoms as for instance the stigmata need nevertheless not to be designated as *affections* It is therefore practically unimportant if they outlast the successful treatment Other symptoms of a similar nature seem to be pulled along indirectly by some psychogenic symptoms for indirectly they really depend on some psychic causation

I shall now speak of those difficulties and inconveniences of our therapeutic method which are not evident from the preceding case histories or from the following remarks concerning the technique of the method I will rather enumerate and indicate them than go into details The process is toilsome and wearisome for the physician it presupposes in him a profound interest for psychological occurrences and yet also a personal sympathy for the patient I could not imagine myself entering deeply into the psychic mechanism of an hysteria in a per on who would impress me as common and disagreeable and who would not on closer acquaintanceship be able to awaken in me human sympathy whereas I can treat a tabetic or a rheumatic patient regardless of such personal interest No less demanding are the requisites on the patient s side The method is especially inapplicable in a person below a certain level of intelligence and it becomes extremely difficult wherever there is any tinge of mental deficiency It requires the full consent the full attention of the patients but above all their confidence for the analysis regularly leads to the inmost and most secretly guarded psychic processes A large proportion of the patients uitable for such treatment withdraw from the physician as soon as they get an inkling whither this investigation tend The physician remains a stranger to them In others who have determined to give themselves up to the physician and bestow their confidence upon him something only voluntarily given but never demanded in all those I say it is hardly *avoidable that the personal relation to the physician* should not become unduly prominent at least for some time Indeed it seems as if such an influence exerted by the physician is a condition under which alone a solution of the problem is possible I do *not* believe that it makes any essential difference in this state of affairs whether one resorts to hypnosis or has to avoid or substitute for it Yet fairness demands that we emphasize the fact that although these inconveniences are inseparable from our method, they nevertheless cannot be charged to it On the contrary it is very obvious that they are conditioned in the presuppositions of the neuroses destined to be cured and that they are interwoven in every medical activity which intensively concerns itself with the patient and produce in him a psychic change I could ee no harm or danger in the application of hypnosis even in these cases where it was used excessively The causes for the harm produced lay elsewhere and deeper When I review the therapeutic efforts of those years since the communications of my honoured teacher and friend J Breuer gave me the cathartic method I believe that I have more often produced good than harm and brought about some things which could not have been produced by any other therapeutic means On the whole it was as expressed in the Preliminary Communication a distinct therapeutic gain

I must mention still another advantage from the application of this method No severe case of complicated neurosis with either an excessive or slight tinge of hysteria can better be explained than by subjecting it to an analysis by Breuer s method In making this analysis I find that whatever shows the hysterical mechanism disappears first while the rest of the manifestations I meanwhile learn to interpret and trace back to their aetiology I thus gain the essential factors indicated by the instrument of the therapy of the neurosis in question When I think of the ordinary differences between my opinion of a case of neuro is *before* and *after* such an analysis I am almost tempted to maintain that the analysis is indispensable for the knowledge of a neurotic disease. Moreover I have made it a practice of applying the cathartic psycho therapy in acute cases in conjunction with a Weir Mitchell rest cure This advantage lies in the fact that on the one side I avoid the very disturbing intrusion of

new psychic impress ons which may be produced during psycho-therapy on the other hand. I exclude the monotony of the Weir Mitchell treatment during which the patient frequently merges into harmful reveries.

II

I will now add to my former observat ons ... mpting to use Breuer s method in ... nd ... by ... be ... a number of the pati ... hypn ized. But as hypnosis was necessary to broaden consciousnes in order to find the path ... genic reminiscences which d ot exist in the ordi... ry consciousness I was th refore, forced either to give up such pat nts or to bring about this broadening by other means.

The reason why one person is hypnotizable and anoth r not I could o more explain than others, and hence I c uld not start on a causal way towards the remo al of th difficult es I also bserved that in som patients th obsta ce was still more ma ked they even refused to ubm t t hypnosis The dea then occurred t me that both cases might be dentical, and that in both it might merely signify an unwill ingness. Those who entertain psychic do bts against hypnotism are not hypn tizabl it makes o diff re ce wh ther th y express the r ...

... t som th ng which they designated as an indis tinct rec ll ction yet were unab e to pursue t. I then f llowed Bernh im s example f fo ci b y awak ning apparently f rgotten impress ns f m somnambulism. I ass red them that they did know t, and that they w uld recall t, tc., and in this way som thou ht of som thing while in others the recollections w t even further I urged still more I rd red the pa ti t t lie down and oluntarily shut his eyes so as to c centra e his mind and I then discovered that without an hypnos th re em rged ew and re rospective reminiscences which probabl belonged to our theme. Through such experiences I ga ned the mpression that throu h urgin alone it would really be possible to bring to light the definitely existing pathogenic series of ideas and as this urging necessitated much exertion on my part and showed me that I had to overcome a resistance I therefore formulated this whole state of affa rs into th following theory *Th ough my psych c ... overcome a psych c force in the* ... same psychic force which a... of the hysterical symptom and which at that time prevented the pathogenic idea from be coming consc ous What kind of force could here be assumed as effecti e and what moti e could ha e brought t i to acti ty? I could easily formulate an opinion for I already had some complete analyses at my disposal in which I found examples of pathogenic forgotten and repressed ideas From these I could judge the general character of such ideas They were altogether of a painful nature adapted to provok the affects of hame of reproach of psychic pain, or the feeling of injury they were altogether of that kind wh ch one would ha e liked not to experience and preferred to forget

F om ll these there resulted the thought of def as if pontaneou ly Indeed t is generall admitted by all psych logi ts that the accepta c f a new dea (acceptanc in the sense of belief admissi n of reality) depends on the mod and drift of the ideas already united in the ego and for the process of censorship to which the newly arri ed idea is subjected pecial t chnical names ha e been created. An idea entered into the patient s ego which proved t be unbearable and evoked a force of repulsion on the part of the ego the obj ct of which was *defence* again t this unbearable idea. This d fence actually suc eeded and the idea concerned was crowded out f con ciou ness and out of memory so that ts psychic trace co ld not pparently be f und yet this trace must ha e xi ted. When I made th eff rt t direct the attentio t it I felt the same fo ce a a *e force* which showed it elf as a *rep ls on* n the g nes s f the symptom If I ould now mak probabl that the dea becam pathog nic in c equence f the exclu n and re-

Cf. p. 3 above.

pression the chain would seem complete In many epicrises of our histories and in a small work concerning the defense neuropsychoses (1894) I have attempted to indicate the psychological hypotheses with the help of which this connection as well as the fact of conversion could be made clear

Hence a psychic force the repugnance of the ego has originally crowded the patho enic idea from the association and now opposed its return into the memory The *not knowing* of the hysterics was really a—more or less conscious—*not willing to know* and the task of the therapist was to overpower this association resistance by psychic labour Such accomplish*ment is above all brought about by urging* that is by applying a psychic force in order to *direct the patient s attention to the ideas that* one wishes to trace It does not however stop here but as I will show it assumes new forms in the course of the analysis and calls to aid more psychic forces

I shall above all still linger at the urging One cannot go very far with such simple assurances as You do know it just say it or It will soon come to your mind After a few sentences the thread breaks even in the patient who is in a state of concentration We must not however forget that we deal everywhere here with a quantitative comparison with the struggle between motives of diverse force and intensity The urging by a strange and inexperienced physician *does not suffice to overcome association resistance* in a grave hysteria One *must think of more forceful means*

Here I utilize in the first place a small technical artifice I inform the patient that in the next moment I will exert pressure on his forehead I assure him that during this pressure he will see some reminiscence in the form of a picture or some thought will occur to him and I obligate him to communicate to me this picture or this thought no matter what it might be He must not keep it to himself because he may think that it is not the desired or the right thing or *because it is too disagreeable to* say There should be neither criticism nor res*ervation because of* affect or underestimation Only thus could we find the things desired and *only* thus have we unfailingly found them I then exerted pressure for a few seconds on the forehead of the patient lying in front of me and after ceasing it I asked in a calm tone as if any disappointment was out of the question What have you seen? or What occurred to your mind?

This method taught me a great deal and led me to the goal every time Of course I know that I can substitute this pressure on the forehead by any other sign or any other physical influence but as the patient lies before me the pressure on the forehead or the grasping of his head between my two hands is the most suggestive and most convenient thing that I could undertake for this end To explain the efficacy of this artifice I may perhaps say that it corresponds to a momentary reinforced hypnosis but the mechanism of hypnosis is so enigmatical to me that I would not like to refer to it as an explanation I rather think that the advantage of the process lies in the fact that through it I dissociated the attention of the patient from his conscious quest and reflection *in brief* from everything upon which *his will* could manifest itself The fact that under the *pressure of my hand there always appeared* that which I was looking for tau ht me that the supposedly forgotten patho enic ideas always lie ready close by and are attainable through easily approachable associations all that is necessary is to clear away some obstacle This obstacle again seems to be the person s will and different persons learn in different ways how to discard their wilfulness and to assume a perfectly objective attitude towards the psychic processes within them

It is not always a *forgotten* reminiscence which comes to the surface under the pressure *of the hand in the rarest cases the real patho*genic reminiscences can be superficially dis*covered More frequently an idea comes to* the surface which is a link between the first idea and the desired pathogenic idea of the association chain or it is an idea forming the starting point of a new series of thoughts and remini cences at the end of which is the pathogenic idea The pressure therefore has really not revealed the pathogenic idea which if torn from its connection without any preparation would be incomprehensible but *it* has shown the way to it and indicated the direction to*wards which the inve tigation must proceed* The idea which is at first awakened through the pressure may correspond to a familiar reminiscence which was never repressed If the connection becomes torn on the road to the

pathogenic dea all that is neces ary for the reproductio of a new orientation and connec tion is a repetitio of the procedure that is of the pressure

In still other cases the pressure of the hand awakens remini cence well known to the pa tient, which appearance however causes him surprise because he has forgotten its relation to the riginal idea In the further course of the analysis this relation becomes clear F om all these results of the pressure o e recei es a delus e impress on of a superior i telligence outside of the patient onsciousness whi h systemat cally h lds a larg psychic material fo definite purposes and has provided an in genious arrangement for its return int con sciousness I p esum however that this un conscious seco d intelli ence is really only ap parent.

In ev ry complicated analysis one works re peatedly nay o ti uously with the help of this p ocedure (pressu e o the forehead) which leads us from the place wh re the pa tient s wak ful reco ductions became inter rupted it shows s the way to rem nisce ces which emained known and calls our ttent on to connections which ha sunk into forgetful ness. It also evokes and onn cts memories which ha e fo years been withdrawn from as sociation though they can still be r cognized as mem ries and finally as the highest per f rmance of rep oductio it causes the ppea ance of tho ghts whi h the patient neve wi hes to recognize as his own whi h he does n t re member although he dmits that th y e in exorably requ d by the c nnection and is co vinced th t precisely these ideas will cause the t rminatio of the analysis and th cessa tio f the symptoms

I will now ttempt t gi e a series f amples which will how the excellent a h eve ments f this p oc dur I treated a y ung lady who s ffe ed f x years f om an int l erabl and protracted nou c gh which p parently was urtu ed by ery ommon catarrh but must have had ts strong psychi mot es E ry the rem dy had l g sin sh wn tself powerles and I theref re att mpted to m e the sympt m by psycho-analysis All that h could remember was that the n rvous cou h be ga t the g f fourteen whil he boarded with he unt Sh remembe ed absolut ly no psychic c tement during that tim d did not bel ev that ther was m t e f her uff ing U de the p essu f my hand h t first called large dog Sh then recognized the memory p cture it was her aunt s dog which was attached to her and used to accompany her everywhere and without any further aid it oc curred to her that this dog died and that the children buried it solemnly and on the re turn from thi funeral her cough appeared I a ked her why he began to cough and the f l lowing th ught occurred to her Now I am all alone in this world no one loves me here this animal was my only friend and now I have lost it. She then continued her story

The cou h disappea ed when I left my aunt, but reappeared a year and a half later — What was the reason for it? — I do not know I gain exerted ome pressure on the forehead and she recalled the news of her uncl s death during which the cou h aga n manifested it elf and also recalled a train of thou ht s milar to the former The uncle was apparently the only one in the family who sympathized with her and loved her That was ther f re the pathogenic idea People do not lo e her everybody el e is preferred she real *ly does not deserve to be loved etc.* To the idea of lo e there clung something which caused a ma ked resi tance to the communica tion. The analysis was int rrupted before this explanat on was obtained.

Some time ago I attempted to relieve an eld rly lady of her anxiety attacks which, con s dering their characteristic qualities were hardly suitabl for uch treatment. Since h r menopause she had bec me extremely religious a d lw ys rece ed me a if I were the Devil— she was lways armed with a small ivory cruci fix which he hid in he hand. Her atta ks of anxiety which bore a hysterical character could be traced t her early girlhood and were s pposed to ha e originated f om the applica t on f n iodin preparat o to reduce a mod erate swelling of the thyro d I naturally re pudiated this origin and s ught to substit te *it by an ther whi h* was in better harm y with my ew co erning the et logy f neu tic symptom T th first questi n for an imp es on f h y th, which would stand in cau al connection to th tta ks f anxiety

[illegible]

mp essi on this gi l which was co trary to th intenti n of the auth r She burst into t rs and flung the book away That was bef e th fi t atta k f anxi ty The next remini scen ferred t h b the s teacher who

showed her great respect and for whom she entertained a warmer feeling This reminiscence culminated in the reproduction of an evening in her parents home during which they all sat around the table with the young man and delightfully enjoyed themselves in a lively conversation During the night following this evening she was awakened by the first attack of anxiety which surely had more to do with some resistance against a sensual feeling than perhaps with the coincidental use of iodine In what other way could I have succeeded in revealing in this obstinate patient prejudiced against me and every worldly remedy such a connection contrary to her own opinion and assertion?

On another occasion I had to deal with a young happily married woman who as early as in the first years of her girlhood was found every morning for some time in a state of lethargy with rigid limbs opened mouth and protruding tongue Similar attacks though not so marked recurred at the present time on awakening A deep hypnosis could not be produced so that I began my investigation in a state of concentration and assured her during the first pressure that she would see something that would be directly connected with the cause of her condition during her childhood She acted calmly and willingly she again saw the residence in which she had passed her early girlhood—her room the position of the bed the grandmother who lived with them at the time and one of her governesses whom she dearly loved Then there was a succession of small scenes in these rooms and among these quite indifferent persons the conclusion of which was the leavetaking of the governess who married from the home I did not know what to start with these reminiscences I could not bring about any connection between them and the aetiology of the attacks To be sure the various circumstances were recognized as having occurred at the same time as the attacks first appeared

Before I could continue the analysis I had occasion to talk to a colleague who in former years was my patient s family physician From him I obtained the following explanation At the time that he treated the mature and physically well developed girl for these first attacks he was struck by the excessive affection in the relations between her and the governess He wont to pay nightly visits to the child s bed and that quite regularly after such visits the child was found in the morning in an attack She did not hesitate to bring about the quiet removal of this corruptress of youth The children as well as the mother were made to believe that the governess left the house in order to get married

The treatment which was above all successful consisted in informing the young woman of the explanations given to me

Occasionally the explanations which one obtains by the pressure procedure follow in very remarkable form and under circumstances which make the assumption of an unconscious intelligence appear even more alluring Thus I recall a lady who suffered for years from obsessions and phobias and who referred the origin of her trouble to her childhood but could mention nothing to which it could have been attributed She was frank and intelligent and evinced only a very slight conscious resistance I will add here that the psychic mechanism of obsessions is very closely related to that of hysterical symptoms and that the technique of the analysis in both is the same

On asking the lady whether she had seen or recalled anything under the pressure of my hand she answered Neither but a word suddenly occurred to me — A single word? — Yes but it is too foolish — Just tell it — Teacher — Nothing more? — No I exerted pressure a second time and again a single word flashed through her mind Shirt I now observed that we dealt with a new mode of replying and by repeated pressure I evoked the following apparently senseless series of words Teacher—shirt—bed—city—wagon I asked What does all that mean? She reflected for a moment and it then occurred to her that it can only refer to this one incident which now comes to my mind When I was ten years old my older sister of twelve had a violent emotional attack one night and had to be bound put in a wagon and taken to the city I remember distinctly that it was the teacher who overpowered her and accompanied her to the asylum

We then continued this manner of investigation and received from our oracle another series of words which though we could not altogether interpret them could nevertheless be used as a continuation of the story and as an appendix to a second The significance of this reminiscence was soon clear The reason why her sister s illness made such an impression on

her was because they both shared a common secret. They slept in the same room and one night they both submitted to a sexual assault by a certain man. In discovering this sexual trauma of early youth, we revealed not only the trauma of the first obsession but also the trauma which later acted pathogenically.

The peculiarity of this case lies only in the appearance of single catch words, which we had to elaborate into sentences, for the seeming irrelevance and incoherence in these oracle-like words generally occur in all ideas and scenes as a result of pressure. On further investigation it is regularly found that seemingly disconnected reminiscences are connected by intimate streams of thought and that they lead quite directly to the desired pathogenic factor.

I therefore recall with pleasure a case of analysis in which my confidence in the results of this method was very splendidly justified. A very intelligent and apparently very happy young woman consulted me for persistent pain in her abdomen, which yielded to no treatment. I found that the pain was located in the abdominal wall and was due to palpable muscular hardening and I therefore ordered local treatment.

After months I again saw the patient who said that "the pain had disappeared after taking the treatment and remained away a long time, but it has now reappeared as a nervous pain. I recognize it by the fact that I do not perceive it now on motion as before but only during certain hours, as for example, in the morning on wakening, and during certain excitements. The patient's diagnosis was quite correct. It was now important to discover the cause of this pain, but in this she could not assist me in her uninfluenced state. When I asked her in a state of concentration and under the pressure of my hand whether anything occurred to her or whether she saw anything, she began to describe her visual pictures. She saw something like a sun with rays which I naturally had to assume to be a phosphene produced by pressure on the eyes. I expected that the needful pictures would follow, but she continued to see stars of a peculiar pale blue light like moonlight, etc., and I believed that she merely saw glittering, shining and twinkling spots before her eyes. I was already prepared to add this attempt to the failures and I was thinking how I could quietly withdraw from this affair when my attention was called to one of the manifestations which she described. She saw a big black, inclined cross, the edges of which were surrounded with a subdued moon-like light in which all the pictures thus far seen were shining, and upon the cross beam there flickered a little flame that was apparently no longer a phosphene. I continued to listen. She saw numerous pictures in the same light, peculiar signs resembling somewhat Sanscrit. She also saw figures like triangles among which there was one big triangle, and again the cross. I now thought of an allegorical interpretation, and asked, "What does this cross mean?" — It is probably meant to interpret pain, she answered. I argued saying that, By cross one usually understands a moral burden, and asked her what was hidden behind that pain. She could not explain that and continued looking. She saw a sun with golden rays which she interpreted as God, the primitive force; she then saw a gigantic lizard which she examined quizzically but without fear, then a heap of snakes, then another sun, but with mild silvery rays and in front of it between her own person and this source of light, there was a barrier which concealed from her the center of the sun.

I knew for some time that we dealt here with allegories and I immediately asked for an explanation of the last picture. Without reflecting she answered: "The sun is perfection, the ideal, and the barrier represents my weakness and failings which stand between me and the ideal. — Indeed, do you reproach yourself? Are you dissatisfied with yourself? —"Yes. — Since when? — Since I became a member of the Theosophical Society and read the writings edited by it. I have always had a poor opinion of myself. — What was it that made the last strongest impression upon you? — A translation from the Sanscrit which now appears in serial numbers. A minute later I was initiated into her mental conflicts and into her self reproaches. She related a slight incident which gave occasion for a reproach, and in which, as a result of an inciting conversion, the former organic pain first appeared. The pictures which I had at first taken for phosphenes were symbols of occultistic streams of thought, perhaps plain emblems from the title pages of occultistic books.

Thus far I have warmly praised the achievements of the pressure procedure and have entirely neglected the aspect of the defence or the resistance, so that I certainly must have given the impression that by means of this small artifice one is placed in a position to become master of the psychic resistances to the cathartic method. But to believe this would be a gross

mistake Such advantages do not exist in the treatment so far as I can see here as every where else a great change requires much effort The pressure procedure is nothing but a trick serving to surprise for awhile the defensive ego in all graver cases it soon recalls its intentions and continues its resistance

I need only recall the various forms in which this resistance manifests itself At first the pressure experiment usually fails the first or second time The patient then expresses him self disappointedly saying I believed that some idea would occur to me but I only thou ht how anxious I was for it but nothing came Such attitudes assumed by the patient are not yet to be counted as a resistance we usually answer to that You were really too anxious the second time things will come And they really come It is remarkable how completely the patients—even the most tract able and the most intelligent—can forget the agreement into which they have previously entered *They have promised to tell everything* that occurs to them be it intimately related *to them or not be it agreeable to say or not* that is they are to tell everything without any *choice or influence of criticism or affect* Yet they do not keep their promise it is apparently beyond their powers The work repeatedly stops they continue to assert that this time nothing came to their mind One need not be lieve them and one must always assume and also say that they hold back something because they believe it to be unimportant or perceive it as painful One must insist and assume an assured attitude until one really hears some thing The patient then usually adds I could have told you that the first time — Why did you not say it? — I could not believe that this could be it Only after it returned repeated ly have I decided to tell it or I had hoped that it would not be just that that I could save myself saying it but only after it could not be repressed *have I noticed that I could not* avoid it Thus the patient subsequently be *trays the motives* of a resistance which he did not at first wish to admit He apparently could do nothing but offer resistances

It is remarkable under what subterfuges these resistances are frequently hidden I am distracted today the clock or the piano playing in the next room disturbs me they say I be came accustomed to answer to that Not at all you simply struck something that you are not willing to say That does not help you at all Just stick to it The longer the pause between the pressure of my hand and the utterance of the patient the more suspicious I become and the more it is to be feared that the patient arranges what comes to his mind and distorts it in the reproduction The most important ex planations are frequently ushered in as super fluous accessories just as the princes of the opera who are dressed as beggars Somethin now occurred to me but it has nothing to do with it I only tell it to you because you wish to know everything With this introduction we usually obtain the long desired solution I always listen when I hear a patient talk so lightly of an idea That the pathogenic idea should appear of so little importance on its reappearance is a sign of the successful de fence One can infer from this of what the process of defence consisted Its object was to make a weak out of a strong idea that is to rob it of its affect

Among other signs the pathogenic memories can also be reco nized by the fact that they are *designated by the patient as unessential de spite the fact that they are uttered with re sistance There are also cases where the patient* seeks to disavow the recollections even while *they are being reproduced with such remarks* as these Now something occurred to me but apparently you talked it into me or I know what you expect to this question you surely think that I thought of this and that An e pe cially clever way of shifting responsibility is found in the following expression Now some

explain to the patient that these are only forms and subterfu es of the resistance against the re production of a recollection which in spite of all we are forced to recognize

One generally experiences less trouble in the reproduction of pictures than thoughts Hys *terical patients* who are usually visual are easier to manage than patients suffering from obsessions Once the picture emerges from the memory we can hear the patient state that as he proceeds to describe it it proportionately fades away and becomes indistinct the pa

direction towards which the work should be continued We say to the patient Just look *again at the picture has it disappeared? — As* a whole yes but I still see this detail — Then

this must have some meaning; you will either see something new or this remnant will remind you of something. When the work is finished the visual field becomes free again, and a new picture can be called forth; but at other times such a picture, in spite of its having been described, remains persistently before the inner eye of the patient, and I take this as a sign that he still has something important to tell me concerning this theme. As soon as this has been accomplished, the picture disappears like a wandering spirit returning to rest.

It is naturally of great value for the progress of the analysis to carry our point with the patient, otherwise we have to depend upon what he thinks proper to impart. It therefore will be pleasant to hear that the pressure procedure never failed except in a single case which I shall discuss later, but which I can now characterize by the fact that there was a special motive for the resistance. To be sure it may happen under certain conditions that the procedure may be applied without bringing anything to light, as for example, we may ask for the further etiology of a symptom when the same has already been exhausted, or we may investigate for the psychic genealogy of a symptom, perhaps a pain, which really is of somatic origin. In these cases the patient equally insists that nothing occurred to him, and he is right. We should strive to avoid doing an injustice to the patient by making it a general rule not to lose sight of his features while he calmly lies before us during the analysis. One can then learn to distinguish, without any difficulty, the psychic calm in the real non-appearance of a reminiscence from the tension and emotional signs under which the patient labours in trying to disavow the emerging reminiscences with the object of defence. The differential diagnostic application of the pressure procedure is really based on such experiences.

We can thus see that even with the help of pressure procedure the task is not an easy one. The only advantage gained is the fact that we have learned from the results of this method in which direction to investigate and what things we have to force upon the patient. For some cases this suffices, for it is essentially a question of finding the secret and telling it to the patient, so that he is then usually forced to relinquish his resistance. In other cases more is necessary; here the continuing resistance of the patient manifests itself by the fact that the connections become torn, the solutions do not appear and the recalled pictures come indistinctly and incompletely. On reviewing at a later period the earlier results of an analysis we are often surprised at the distorted aspects of all the occurrences and scenes which we have snatched from the patient. It usually lacks the essential part, the relations to the person or to the theme, and for that reason the picture remained incomprehensible. I will now give one or two examples showing the effects of such a censorship during the first appearance of the pathogenic memories. The patient sees the upper part of a female body on which a loose covering fits carelessly; only much later he adds to this torso the head, and thereby betrays a person and a relationship. Or he relates a reminiscence of his childhood about two boys whose forms are very indistinct, and to whom a certain mischievousness was attributed. It required many months and considerable progress in the course of the analysis before he again saw this reminiscence and recognized one of the children as himself and the other as his brother. What means have we now at our disposal to overcome this continued resistance?

We have but few, yet we have almost all those by which one otherwise exerts a psychic influence on the other. In the first place, we must remember that psychic resistance, especially of long continuance, can only be broken slowly, gradually, and with much patience. We can also count on the intellectual interest which manifests itself in the patient after a brief period of the analysis. On explaining and imparting to him the knowledge of the marvelous world of psychic processes, which we have gained only through such analysis, we obtain his collaboration and cause him to view himself with the objective interest of the investigator, and we thus drive back the resistance which rests on an affective basis. But finally—and this remains the strongest motive force—after the motives of the defence have been discovered, we must make the attempt to reduce them or even substitute them by stronger ones. Here the possibility of expressing the therapeutic activity in formulae ceases. One does as well as he can as an explainer where ignorance has produced shyness, as a teacher, as a representative of a freer and superior philosophy of life, and as a confessor who through the continuance of his sympathy and his respect imparts so to say absolution after the confession. One endeavours to do something humane for the patient as far as the range of one's own personality and the measure of sympathy which one can set apart for the case allows. It is an indispensable pre-

requisite for such psychic activities to have approximately discovered the nature of the case and the motives of the defence that are here effective Fortunately the technique of urging and the pressure procedure take us just so far The more we have solved such enigmas the easier will we discover new ones and the earlier will we be able to manage the actual curative psychic work For it is well to bear in mind that, although the patient can rid himself of an hysterical symptom only after reproducing and uttering under emotion its causal pathogenic impressions yet the therapeutic task merely consists in inducing him to do it and once the task has been accomplished there remains nothing for the doctor to correct or abolish All the contrary suggestions necessary have already been employed during the struggle carried on against the resistance The case may be compared to the unlocking of a closed door where as soon as the doorknob has been pressed downward no other difficulties are encountered in opening the door

Among the intellectual motives employed for the overcoming of the resistance one can hardly dispense with one affective factor that is the personal equation of the doctor and in a number of cases this alone is enough to break the resistance The conditions here do not differ from those found in any other branch of medicine and one should not expect any therapeutic method fully to disclaim the cooperation of this personal factor

III

In view of the discu sions in the preceding section concerning the difficulty of my technique which I have unreservedly exposed—I have really collected them from my most difficult ca es though it will often be easier work—in view then of this state of affairs everybody will wish to ask whether it would not be more suitable instead of all these tortures to apply one s self more energetically to hypnosis or to limit the application of the cathartic method only to such cases as can be put into deep hypnosis To the latter proposition I should have to answer that the number of patients available for my skill would shrink considerably but to the former advice I will advance the supposition that even where hypnosis could be produced the resistance would not be very much lessened My experiences in this respect are not particularly extensive so that I am unable to go beyond this supposition but wherever I achieved a cathartic cure in the *hypnotic state* I found that the work devolved upon me was not less than in the state of mere concentration I have only recently finished such a treatment during course of which I

sciou and somatically distinguished by the fact that she was unable to open her eyes or rise without my *ordering her to do so* and still I never had a case showing greater resistance than this one I placed no value on these physical signs and towards the end of the ten months treatment they really became imperceptible The state of the patient on which we worked has therefore lost nothing of its psychic peculiarities such as the ability to recall the unconscious and its very peculiar relation to the person of the physician To be sure in the history of Mrs Emmy von N I have described an example of a cathartic cure accomplished in a profound somnambulism in which the resistance played almost no part But nothing that I obtained from this woman would have required any special effort I obtained nothing that she could not have told me in her waking state after a longer acquaintanceship and some personal regard The real causes of her disease which were surely identical with the causes of her relapses after my treatment *I have never found—it was my first attempt* in this therapy—and when I once asked her accidentally for a reminiscence which contained a fragment of the erotic I found her just as resistive and unreliable in her statements as any one of my later non somnambulic patients This patient s resistance even in the somnambulic state against other requirements and exactions I have already discussed in her history Since I have witnessed cases which even in deep somnambulism were absolutely refractory therapeutically despite their obedience in everything else I really have become skeptical as to the value of hypnosis for the facilitation of the cathartic treatment A case of this kind I have in brief reported and could still add others Besides I admit that even this experience fell badly short of my need for a quantitative relation between cause and effect in the psychic spheres

In our discussion thus far the idea of resistance has *thrust it elf to the foreground* I have shown how in the therapeutic work one is led to the conception that hysteria originates

See St d üb Hy ter 1895 p 85

through the repression of an u bearable dea as a motive of defence that the repressed idea remains as a weak (mildly intensi e) remini scence a d that the affect snatched from it is used for a somatic innervation that is for con version of the excitement By virtue of its re pres o the dea becomes the cause of morbid symptoms, that is pathogenic. A hysteria show ng this psychic mechanism may be des gnated by the nam of *defence-hysteria* but both Breuer and myself have repeatedly spoken of two kinds of hysterias which we have named *hypnoid* a d *retent on-hysteria* Th first to reveal tself to us was really the hypno d hysteria, for which I can me tio no better exampl than Breuer s case of Miss Anna O For this form of hysteria Breuer gi es an essentially d fferent psychic mechanism than f r the form which is characterized by con ers n H re the idea be comes pathogenic th ugh the fact that it is con eived in a peculia psychic stat ha ing remained from the ery beginning external to

res h c force to
d ot
I elp f
ntiat
really

shows n thing of such a resistance

I h ld this distinction as so essential that it has readily induced me to dhere to the f rmu tion of the hypn d hyst ria It is however remarkabl that in my own experien e I enc un tered o genuine hypn d hysteria whatever I trea ed changed itself into a defence hysteria. Not that I ha e n ve dealt with symptoms which manifestly originated in separated con scious states and th ref re were excluded from being accepted int the ego I ncoun tered this also in my own cases but I could show that the so-called hypn id state owed its separati n t the f ct that a split-off psychic group originated bef re through d fen In brief I cannot suppress the suspici n that hypnoid and d fence hysteria meet som where at their roots, and that the d fenc is the primary thing but I know othing about t.

Equally uncertain at present my opinion concerning the rete t hysteria in which the therapeutic w k is al supposed to f llow without any resistance I had case which I took f typ al retenti hysteria, and I was pleased with the anticipatio f an easy and certain succes but this su cess failed t com easy as the wo k really was. I theref re presume, and again with all caution ppropriat to ignorance, that in retention hysteria too we can find at its bas s a fragment of defence, which has thrust th whole process into hysteria Let us hope that new experiences will soon decide whether I am running into the danger of one- dedness and error in my tend ency to spre d the conception of defence for the whole of hysteria.

Thus far I ha e dealt with the difficulties and technique of the cathartic method. I would now like to add a few indications to show how one does an analysis with this technique For me this is a ery interesting theme but I do not expect that it will excite similar interest in others who ha e not practised such analyses. Properly speaking we shall again deal with technique but th s time with those difficulties co cerning which the patient cannot be held responsible and which must in part be the same in a hypnoid and a retention-hysteria as in the d fe ce-hysteria which I have in mind as a model. I start with this last fragment of discussion with the hope that the psychic pe culiarities to be revealed here might sometimes attain a certain value as raw material for ideational dynamics

The first and strongest impression which one gains from such an analysis is surely the fact that the pathogenic psychic material, appar ently for tten and not at the disposal of the ego whi h plays no rôle in the association and in m mory still lies ready in some manner and, what is more in proper and good order All that is necessary is to remove the resistances blocking the way Barring that, everything is known as well as we know anything at all. The proper connection of the indi idual ideas among themsel es and with the non-pathogenic which are frequently remembered are present they ha e been produced in their time and retained in memory The pathogenic psychic mat rial appears as the property of an intelligence which is n t necessarily inferior to the ormal ego The semblance of a second personality is ften most d lusively p oduced.

Whethe this imp ession is justified whether the arrangement f the psychic material result ing fter the adjustment is not transferred back int th period f the disease—these are questions which I do ot like to con ide in this place. One cannot certainly describe the experiences gained from such analyses more easily and m re clea ly than by placing one s self in th position which one may take f r a survey aft r the whole thing has been com p eted.

The situation is usually not so simpl as one

requisite for such psychic activities to have approximately discovered the nature of the case and the motives of the defence that are here effective Fortunately the technique of urging and the pressure procedure take us just so far The more we have solved such enigmas the easier will we discover new ones and the earlier will we be able to manage the actual curative psychic work For it is well to bear in mind that although the patient can rid himself of an hysterical symptom only after reproducing and uttering under emotion its causal pathogenic impressions yet the therapeutic task merely consists in inducing him to do it and once the task has been accomplished there remains nothing for the doctor to correct or abolish All the contrary suggestions necessary have already been employed during the struggle carried on against the resistance The case may be compared to the unlocking of a closed door where as soon as the doorknob has been pressed downward no other difficulties are encountered in opening the door

Among the intellectual motives employed for the overcoming of the resistance one can hardly dispense with one affective factor that is the personal equation of the doctor and in a number of cases this alone is enough to break the resistance The conditions here do not differ from those found in any other branch of medicine and one should not expect any therapeutic method fully to disclaim the cooperation of this personal factor

III

In view of the discussions in the preceding section concerning the difficulty of my technique which I have unreservedly exposed—I have really collected them from my most difficult cases though it will often be easier work—in view then of this state of affairs everybody will wish to ask whether it would not be more suitable instead of all these tortures to apply one s self more energetically to hypnosis or to limit the application of the cathartic method only to such cases as can be put into deep hypnosis To the latter proposition I should have to answer that the number of patients available for my skill would shrink considerably but to the former advice I will advance the supposition that even where hypnosis could be produced the resistance would not be very much lessened My experiences in this respect are not particularly extensive so that I am unable to go beyond this supposition but wherever I achieved a cathartic cure in the hypnotic state I found that the work devolved upon me was not less than in the state of mere concentration I have only recently finished such a treatment during course of which I caused the disappearance of an hysterical paralysis of the legs The patient merged into a state psychically very different from the conscious and somatically distinguished by the fact that she was unable to open her eyes or rise without my ordering her to do so and still I never had a case showing greater resistance than this one I placed no value on these physical signs and towards the end of the ten months treatment they really became imperceptible The state of the patient on which we worked has therefore lost nothing of its psychic peculiarities such as the ability to recall the unconscious and its very peculiar relation to the person of the physician To be sure in the history of Mrs Emmy von N I have described an example of a cathartic cure accomplished in a profound somnambulism in which the resistance played almost no part But nothing that I obtained from this woman would have required any special effort I obtained nothing that she could not have told me in her waking state after a longer acquaintanceship and some personal regard The real causes of her disease which were surely identical with the causes of her relapses after my treatment I have never found—it was my first attempt in this therapy—and when I once asked her accidentally for a reminiscence which contained a fragment of the erotic I found her just as resistive and unreliable in her statements as any one of my later non somnambulic patients This patient s resistance even in the somnambulic state against other requirements and exactions I have already discussed in her history Since I have witnessed cases which even in deep somnambulism were absolutely refractory therapeutically despite their obedience in everything else I really have become skeptical as to the value of hypnosis for the facilitation of the cathartic treatment A case of this kind I have in brief reported and could still add others Besides I admit that even this experience fell badly short of my need for a quantitative relation between cause and effect in the psychic spheres

In our discussion thus far the idea of resistance has thrust itself to the foreground I have shown how in the therapeutic work one is led to the conception that hysteria originates

See St d b Hy t 1895 p 85

there connected by by paths open into the nucleus To put it in different words it is very remarkable how frequently *a symptom is man ifoldly determined that is overdeterm ned*

I will introduce one more complication and t.en my eff rt to illustrate the organization of the pathogenic psychic material will be achieved. It can happen that we m y deal with more than one single nucleus in the pathogenic mate al as for example when we ha e to analyze a second hysterical outbreak having its own aetiology but which is still conn cted with the first outbreak of an acute hysteria which has been overc me ye rs before It can readily be imagined what strata and streams of thought m t be added in order to produce a connec ti n between the two pathogenic nuclei

I will till dd a few observations to the given p cture of the organizati n of the patho genic material We have said of this material that it behav s like a fo eign body and that the therapy ls acts like the removal of a foreign body f m the living tissues. We are n w in positio to cons der the shortcomings f this comparison A f re gn body does not enter into any connecti n with the l yers of tissue s rrounding it, although it changes them and produces in them a reactive inflammation On the ther hand our pathogenic psychic group does not allow itself to be cleanly shelled *out from* the ego its uter lay rs radiate n all direct ons int the parts of the normal ego and really bel g to the latte as much as to the pathogenic organization The boundaries between both become purely conve tional in the analysis being placed now here, now there and in certain l cati ns no dem rcation is pos sibl The in er layers bec me more nd more estranged from th ego witho t showing vis ible beginning f the pathogenic boundaries The pathogenic organization really does not beha e like a fore gn body b t rath r lik an infiltrati n. Th infiltrate must in this com pariso be assumed to be the res tance In deed the therapy doe n t consist in extirpati g something—psychotherapy cann t do that at present—but t causes melting of the resis tanc and thus pens the w y f r the circula tio into a hitherto closed territ ry

(I make use h re f a series of comparisons all of which have only very limited res m blanc t my theme and d n t even gree am g th msel es. I am ware f that and I am t in danger f ove -estimating th ir val ue but as t is my int tion t illustrate the many sides of a m t c mplicated and not as yet dep cted idea I *therefore* take the liberty of deali g also in the following pages with comparisons which are not altogether free from objections)

If after a thorough adjustment one could show to a third party the pathogenic material in its present recognized complicated and mul tidimensi nal organization he would justly propound the question How could such a camel go through the needle s eye? Indeed one does not speak unjustly of a 'narrowing of consciousness The term gains in sense and freshness for the phys cian who accomplishes uch an analys s *Only one s ngle reminiscence* can enter into the ego-consciousness the pa tient occupied in working his way through this one sees *nothing* of that wh ch follows and forgets everythi g that has already wedged its way through If the conquest of this *one* path ogenic reminiscence strikes against impedi ments as for example if the patient does n t let up the resistance against it but wishes to repress or d stort t the strait is so to speak blocked the wo k comes to a standst ll it cannot ad ance and the one reminiscence in the breach confronts the patient until he takes it up nt the breadth of his ego The whole spatially extended mass of the pathogenic ma terial is thus drawn th ough a narrow fissu e

co jectured rgani tion He who desi es still more comparisons may think here of a Chinese puzzle

If o e is about to begin an analysis in which one may expect such an organization of the pathogen c material the following results of

zation. E en if it could be g ... t would still not know how to start with the explanation gi en to him nor would it change him p ychically

There is n thi g l ft to do but follow up the periph ry of the path genic psychic forma ti n On begins by allowing the patient to

any new esistance

After ha ing w ked for while in such mann r a cooperati g ctivity is usually mani

represents it in special cases as for example in a single case in which a symptom originates through a large trauma We frequently deal not with a single hysterical symptom but with a number of such which are partially independent of one another and partially connected We must not expect a single traumatic reminiscence and as its nucleus one single pathogenic idea but we must be ready to assume a series of partial traumas and concatenations of pathogenic mental streams The monosymptomatic traumatic hysteria is as it were an elementary organism a single being in comparison to the complicated structure of a grave hysterical neurosis as we generally encounter it

The psychic material of such hysteria presents itself as a multi dimensional formation of at least *triple stratification* I hope to be able to justify soon this figurative expression First of all there is a nucleus of such reminiscences (either experiences or mental streams) in which the traumatic moment culminated or in which the pathogenic idea has found its purest formation Around this *nucleus* we often find an incredibly rich mass of other memory material which we have to elaborate in the analysis in the triple arrangement mentioned *before In the first* place *there is an unmistakable linear chronological* arrangement which takes place within *every individual theme* As an example of this I can only cite the arrangement in Breuer s analysis of Anna O The

there were from ten to one hundred single reminiscences in chronological order It read like an abstract from an orderly kept archive The analysis of my patient Emmy von N contained similar memory fascicles though not so fully described but they formed part of every analysis They always appeared in chronological *order* which was as definitely reliable as the serial sequences of the days of the week or the names of the months in psychically normal individuals They increased the work of the analysis through the peculiarity of reversing the series of their origin in the reproduction the freshest and the most recent occurrence of the accumulation occurred first so to speak as a wrapper and the one with which the eries really began gave the impression of the conclusion

The grouping of *similar reminiscences* in a multiplicity of linear stratifications as represented in a bundle of documents in a package etc I have designated as the formation of a *theme* These themes now show a second form of arrangement I cannot express it differently than by saying that they are *concentrically stratified around the pathogenic nucleus* It is not difficult to say what determines these strata and according to what decreasing or increasing magnitude this arrangement follows They are *layers of equal resistance* tending toward the nucleus *accompanied by ones of similar alteration of consciousness* into which the individual themes extend The most peripheral layers contain those reminiscences (or fascicles) of the different themes which can readily be recalled and which were always perfectly conscious The deeper one penetrates the more difficult it becomes to recognize the emerging reminiscences until one strikes those near the nucleus whi h the patient disavows even at the reproduction

As we shall hear later it is the peculiarity of the concentric stratification of the pathogenic psychic material which gives to the course of such an analysis its characteristic features We must now mention the third and most essential arrangement concerning which a general statement can hardly be made It is *the arrangement according to the content of* thought the connection which reaches the nucleus through the logical threads which might in each case correspond to a special irregular and manifoldly devious road This arrangement has a dynamic character in contradistinction to both morphological stratifications mentioned before Whereas in a specially formed scheme the latter would be represented by rigid arched and straight lines the course of the logical concatenation would have to be followed with a wand over the most *tortuous* route from the superficial into the deep layers *and back generally however progressing from* the peripheral to the central nucleus and touching thereby all stations that is its movement is similar to the zigzag movement of the knight in the solution of a chess problem

I shall still adhere for a moment to the last comparison in order to call attention to a point in which it does not do justice to the qualities of the thing compared The logical connection corresponds not *only to a zigzag like devious* line but rather to a ramifyin and especially *to a converging system of lines It has a* junction in which two or more threads meet only to proceed thence united and as a rule many threads running independently or here and

really reached an end or encountered a case requiring no psychic explanation, or whether it is the enormous resistance that halts the work. If the latter cannot be overcome soon, it may be assumed that the thread has been followed into a stratum which is as yet, impenetrable. One lets it fall in order to grasp another thread, which may perhaps be followed up just as far. If one had followed all the threads into this stratum, if the nodes have been reached through which no single isolated thread can be followed, it is well to think of seizing anew the resistances on hand.

One can readily imagine how complicated such a work may become. By constantly overcoming the resistance one pushes his way into the inner strata, gaining knowledge concerning the accumulative themes and passing threads found in this layer; one examines as far as he can advance with the means at hand, and thus gains first information concerning the content; in the next stratum the threads are drowned, taken upon again, and followed until they reach the juncture; they are always retrieved, and by following a memory a single one reaches some by way which finally opens again. In this manner it is finally possible to leave the stratifications and advance directly on the main road to the nucleus of the pathogenic organization. With this the fight is won, but not finished. One has to follow up the other threads and exhaust the material; but now the patient again helps energetically, for his resistance has mostly been broken.

In these later stages of the work it is of advantage if one can surmise the connection and tell it to the patient before it has been revealed to him. If the conjecture is correct, the course of the analysis is accelerated, but even an incorrect hypothesis helps, for it urges the patient to participate and elicits from him energetic retraction, thus revealing that he surely knows better.

One thereby becomes astonishingly convinced that *it is not possible to press upon the patient things which he apparently does not know or to influence the results of the analysis by exciting his expectations.* I have not succeeded a single time in altering or falsifying the reproductions of memory or the connections of events by my predictions; had I succeeded it surely would have been revealed in the end by a contradiction in the construction. If anything occurred as I predicted, the correctness of my conjecture was always attested to by numerous trustworthy reminiscences. Hence one must have no fear to express his opinion to the patient concerning the coming connections which are to follow; it does no harm.

Another observation which I had occasion to see again and again refers to the patient's independent reproductions. I can be assured that not a single reminiscence comes to the surface during such an analysis which has no significance. An interposition of irrelevant memory pictures which has no connection with the important associations does not really occur. An exception not contrary to the rule may be postulated for those reminiscences which, though in themselves unimportant, are indispensable as interpolations since the associations between two closely related reminiscences pass over them. As mentioned above, the period during which a reminiscence abides in the narrow pass of the patient's consciousness is directly proportionate to its significance. A picture which does not disappear requires further consideration, a thought which cannot be abolished must be followed further. A reminiscence never recurs if it has been adjusted; a picture spoken away cannot be seen again. However if that does happen, it can be definitely expected that the second time the picture will be joined by a new content of thought, that the idea will contain a new inference which will show that no perfect adjustment has taken place. On the other hand, a recurrence of different intensities, at first vaguely then quite plainly, often occurs, but it does not, however, contradict the assertion just advanced.

If one of the tasks of the analysis is to remove a symptom (pains, symptoms like vomiting sensations and contractures) which is capable of aggravation or recurrence, this symptom shows during the work the interesting and not undesirable phenomenon of *joining in the discussion.* The symptom in question reappears, or appears with greater intensity as soon as one penetrates into the region of the pathogenic organization containing the aetiology of this symptom, and it continues to accompany the work with characteristic and instructive fluctuations. The intensity of the same (let us say of a nausea) increases the deeper one penetrates into its pathogenic reminiscences; it reaches its height shortly before the latter has been expressed, and suddenly subsides or disappears completely for a while after it has been fully expressed. If through resistance the patient delays the expression, the tension of the sensation of nausea becomes

fested in the patient A number of reminiscences now occur to him without any need of questioning or setting him a task A way has thus been opened into an inner stratum within which the patient now spontaneously disposes of the material of equal resistance It is well to allow him to reproduce for a while without influencing him of course he is unable to reveal important connections but he may be allowed to clear things within the same stratum The things which he thus reproduces often seem disconnected but they give up the material which is later revived by the recognized connections

One has to guard here in general against two things If the patient is checked in the reproduction of the inflowing ideas something is apt to be *buried* which must be uncovered later with great effort On the other hand one must not overestimate his *unconscious intelligence* and one must now allow it to direct the whole work If I should wish to schematize the mode of labour I could perhaps say that one should himself undertake the opening of the inner strata and the advancement in the radial direction while the patient should take care of the peripheral extension

The advancement is brought about by the fact that the resistance is overcome in the manner indicated above As a rule however one must at first solve another problem One must obtain a piece of a logical thread by which direction alone one can hope to penetrate into the interior One should not expect that the voluntary information of the patient the material which is mostly in the superficial strata will make it easy for the analyst to recognize its deep seated locations and to which points the desired connections of thought are attached On the contrary just this is cautiously concealed the patient s assertion sound as if perfect and firm in itself One is at first confronted as it were by a wall which shuts off every view and gives no suggestion of anything hidden behind it

If however one views with a critical eye the assertion obtained from the patient without much effort and resistance one will unmistakably discover it in gaps and damages Here the connection is visibly interrupted and scantily supplemented by the patient through phrases which convey only insufficient information There one strikes against a motive which in a normal person would be designated as flimsy The patient refuses to recognize these gaps when his attention is called to them The physician however does well to seek under these weak points access to the material of the deeper layers and hope to discover just here the threads of the connection which he traces by the pressure procedure One therefore tells the patient You are mistaken what you assert can have nothing to do with the thing in question here we will have to strike again t something which will occur to you under the pressure of my hand

The hysterical stream of thou ht even if it reaches into the unconscious may be expected to show the same logical connections and sufficient motivations as those that would be expected in a normal individual A looseness of these relationships does not lie within the sphere of the neurosis If the association of ideas of neurotics and especially of hysterics makes a different impression if the relation of the intensities of different ideas does not seem to be explainable here on psychological determinants alone we know that such manifestations are due to the existence of *concealed unconscious motives* Such secret motives may be expected wherever such a deviation in the connection or a transgression from the normally justified motivations can be demonstrated

One must naturally free himself from the theoretical prejudice that one has to deal with abnormal brains of *dégénerés* and *deséquilibres* in whom the freedom of overthrowing the common psychological laws of the association of ideas is a stigma or in whom a preferred idea without any motive may grow intensively excessive and another without psychological motives may remain indestructible Experience shows the contrary in hysteria as soon as the hidden—often unconsciously remaining—motives have been revealed and brought to account there remains nothing in the hysterical mental stream that is enigmatical and anomalous

Thus by retracing the breaches of the patient s first statements which are often hidden by false connections one gets hold of a part of the logical thread at the periphery and thereafter continues the route by the pressure procedure

Very seldom do we succeed in working our way into the inner strata by the same thread usually it breaks on the way and yields either no experience or one which cannot be explained or be continued despite all efforts In such a case we soon learn how to protect ourselves from the obvious confusion. The expression of the patient must decide whether one

pathogenic idea acts as a motive for the com plete creation of the neurosis and only with the last word of the analysis does the whole picture of the disea e d sappear very similarly to the behaviour of the individually reproduced reminiscence

If a pathogenic reminiscence or a pathogenic connection which was prev ously withdrawn from the ego-co sci usness is revealed by the work of the analysis and inserted into the ego one can observe in the psychic pers nality hich was thus enriched the many ways in hich it gave utterance to ts ga n Especially does t freq ently happe that after the pa tients have been painstakingly forced to a cer tain knowledge they say 'Why I have known that all the time I could have told you that bef re Th se who ha e mo e ins ht r co nize this ft rwards as self-decept on and ac cu e th ms l s f ingratitud In general the po tio that the g takes tow rds the new acquisiti depends upon th tratum of the analy is f om which the l tter origin tes What

I ha e still another th m to t eat which plays an und sirably great part in the wo k of su h cathartı analys I ha e lready ad mitted the possibility that the pressure pro c dure may f l and despite all surance and urgi g t may evoke no mini ce ces I also tated that two poss biliti s re to be cons d ed th really nothing to ev ke in the pla e where w vest gate—that c n be recog nized by the pe f ctly calm express n of the patient—o we ha e truck against a resis

unbearable and if the expression cannot be forced vomiting actually sets in One thus gains a plastic impression of the fact that the vomiting takes the place of a psychic action (here that of speaking) just as was asserted in the conversion theory of hysteria

These fluctuations of intensity on the part of the hysterical symptom recur as often as one of its new and pathogenic reminiscences is attacked the symptom remains as it were all the time on *the order of the day* If it is necessary to drop for a while the thread upon which this symptom hangs the symptom too merges into obscurity in order to emerge again at a later period of the analysis This play continues until through the completion of the pathogenic material there occurs a definite adjustment of this symptom

Strictly speaking the hysterical symptom does not behave here differently than a memory picture or a reproduced thought which is evoked by the pressure of the hand Here as there the adjustment necessitates the same obsessing obstinacy of recurrence in the memory of the patient The difference lies only in the apparent spontaneous appearance of the hysterical symptom whereas one readily recalls having himself provoked the scenes and ideas But in reality the *memory symbols* run in an uninterrupted series from the unchanged *memory remnants* of affectful experiences and thinking acts to the hysterical symptoms

The phenomenon of *joining in the discussion* of the hysterical symptom during the analysis carries with it a practical inconvenience to which the patient should be reconciled It is quite impossible to undertake the analysis of a symptom in one stretch or to divide the pauses in the work in such a manner as precisely to coincide with the resting points in the adjustment Furthermore the interruption which is categorically dictated by the accessory circumstances of the treatment like the late hour etc often occurs in the most awkward locations just when some critical point could be approached or when a new theme comes to light These are the same inconveniences which every newspaper reader experiences in reading the daily fragments of his newspaper romance when immediately after the decisive speech of the heroine or after the report of a shot etc he reads To be continued In our case the raked up but unabolished theme the symptom at first strengthened but not yet explained remains in the patient s psyche and troubles him perhaps more than before But the patient must understand this as it cannot be differently arranged Indeed there are patients who during such an analysis are unable to get rid of the theme once touched they are obsessed by it even durin the interval between two treatments and as they are unable to advance alone with the adjustment they suffer more than before Such patients too finally learn to wait for the doctor postponing all interest which they have in the adjustment of the pathogenic material for the hours of the treatment and they then begin to feel freer during the intervals

The general condition of the patient during such an analysis seems also worthy of consideration For a while it remains uninfluenced by the treatment expressing the former effective factors but then a moment comes in which the patient is seized and his interest becomes chained and from that time his general condition becomes more and more dependent on the condition of the work Whenever a new explanation is gained and an important contribution in the chain of the analysis is reached the patient feels relieved and experiences a presentiment of the approaching deliverance but at each standstill of the work at each threatening entanglement the psychic burden which oppresses him grows and the unhappy sensation of his incapacity increa es To be sure both conditions are only temporary for the analysis continues disdaining to boast of a moment of well being and continues regardlessly over the period of gloominess One is generally pleased if it is possible to substitute the spontaneous fluctuations in the patient s condition by such as one himself provokes and understands just as one prefers to see in place of the spontaneous discharge of the symptoms that order of the day which corresponds to the state of the analysis

Usually the deeper one penetrates into the above described layers of the psychic structure the more obscure and difficult the work will at first become But once the nucleus is reached light ensues and there is no more fear that a strong gloom will overcast the condition of the patient However the reward of the labour the cessation of symptoms of the disease can be expected only when the full analysis of every individual symptom has been accomplished indeed where the individual symptoms are connected through many junctures one is not even encouraged by partial successes during the work By virtue of the great number of existing causal connections every unadjusted

In another patient, the obstacle did not usu ally show itself directly on pressure but I could always demonstrate it by taking the patient back to the moment in which it originated. The pressure procedure never failed to bring back this moment. By discovering and demonstrating the obstacle the first difficulty was removed, but a greater one still remained. The difficulty lay in inducing the patient to give information where there was an obvious personal relation and where the third person coincided with the physician. At first I was very much annoyed about the increase of this psychic work until I had learned to see the lawful part of this whole process and I then also noticed that such a transference does not cause any considerable increase in the work. The work for the patient remained the same—he perhaps had to overcome the painful affect of having entertained such a wish, and it seemed to be the same for the success whether he took this psychic repulsion as theme of the work in the historical case or in the recent case with me. The patients also gradually learned to see that in such transferences to the person of the physician they generally dealt with a force or a deception which disappeared when the analysis was accomplished. I believe however that if I would have delayed in making clear to them the nature of the obstacle I would have given them a new though milder hysterical symptom for another spontaneously developed.

I now believe that I have sufficiently indicated how such analyses should be executed and the experiences gained from them. They perhaps make some things appear more complicated than they are for many things really result by themselves during such work. I have not enumerated the difficulties of the work in order to give the impression that in view of such requirements it does not pay the physician or patient to undertake a cathartic analysis except in the rarest cases. However in my medical activities I am influenced by contrary suppositions. To be sure I am unable to formulate the most definite indications for the application of the therapeutic method discussed here without entering into the valuation of the more significant and more comprehensive theme of the therapy of the neuroses in general. I have often compared the cathartic psycho-therapy to surgical measures and designated my cures as psycho-therapeutic operations the analogies of flow the opening of a pus pocket, the curetting of a carious location, etc. Such an analogy finds its justification, not so much in the removal of the morbid material as in the production of better curative conditions for the issue of the process.

When I promised my patients help and relief through the cathartic method, I was often obliged to hear the following objections "You say yourself that my suffering has probably much to do with my own relation and destinies. You cannot change any of that. In what manner then can you help me?" To this I could always answer "I do not doubt at all that it would be easier for fate than for me to remove your sufferings but you will be convinced that much will be gained if we succeed in transforming your hysterical misery into everyday unhappiness again, which you will be better able to defend yourself with a restored nervous system.

CHAPTER 5

THE DEFENCE NEURO-PSYCHOSES. A TENTATIVE PSYCHOLOGICAL THEORY OF ACQUIRED HYSTERIA, MANY PHOBIAS AND OBSESSIONS, AND CERTAIN HALLUCINATORY PSYCHOSES

AFTER an exhaustive study of many nervous patients afflicted with phobias and obsessions, a tentative explanation of these symptoms forced itself upon me which happily helped me later to conjecture the origin of such morbid ideas in other new cases, and I therefore believe it worthy of reporting and further examination. Simultaneously with this *psychological theory of phobias and obsessions* the examination of these patients resulted in a contribution to the theory of hysteria or rather to a change of it which seems to imply an important and common character of hysteria as well as the aforementioned neuroses. Further more I had the opportunity to look into the psychological mechanism of a form of indubitable psychic malady and found that my attempted observation shows an intelligible connection between this psychosis and the two neuroses mentioned. At the conclusion of this theme I shall describe the corroborative hypothesis which I utilized in all three cases.

I

I am beginning with that change which seems to be necessary for the theory of the hysterical neuroses.

That the symptom-complex of hysteria as far as it can be understood justifies the assumption of a splitting of consciousness with

tance to be overcome only at some future time We are confronted with a new layer into which we cannot as yet penetrate and this can again be read from the drawn and psychic exertion of the patient s expression A third cause may be possible which also indicates an obstacle not from within but externally This cause oc curs when the relation of the patient to the physician is disturbed and signifies the worst obstacle that can be encountered One can ex pect this in every more serious analysis

I have already alluded to the important role falling to the personality of the physician in the creation of motives which are to overcome the psychic force of the resistance In not a few case especially in women and where we deal with explanations of erotic streams of thoughts the cooperation of the patients be comes a personal sacrifice which must be re compensed by some kind of a substitute for love The great effort and the patient friendli ness of the physician must suffice for such substitutes If this relation of the patient to the physician is disturbed the readiness of the patient s collaboration fails if the phy sician desires information concernin the next pathogenic idea the patient is confronted by the consciousness of the unpleasantness which has accumulated in her against the physician As far as I have discovered this obstacle oc curs in three principal cases

1 In personal estrangement if the patient believes herself slighted disparaged and in sulted or if she hears unfavourable accounts concerning the physician and his methods of treatment This is the least serious case This obstacle can readily be overcome by discussion and explanation although the sensitiveness and the suspicion of hysterics can occasionally manifest itself in unimaginable dimensions

2 If the patient is seized with the fear that she is becoming too dependent on her physi cian that in his presence she loses her inde pendence and could even become sexually de pendent upon him this case is more significant The re of iow a new motive for resistance which manifests it self not only in a certain reminiscence but at each attempt of the treatment Whenever the pressure procedure is started the patient usu ally complains of headache Her new motive for the resistance remains for the most part unconscious and she manifests it by a newly created hysterical symptom The headache sig nifies the aversion towards being influenced

3 If the patient fears lest the painful ideas emerging from the content of the analysis would be transferred to the physician This happens frequently and indeed in many analy ses it is a regular occurrence The transference to the physician occurs through false connec tions I must here give an example The origin of a certain hysterical symptom in one of my hysterical patients was the wish she entertained years ago which was immediately banished into the unconscious that the man with whom she at that time conversed would heartily gra p her and force a kiss on her After the ending of a session such a wish occurred to the patient in reference to me She was horri fied and spent a sleepless night and at the next session although she did not refuse the treatment she was totally unfit for the work After I had discovered the obstacle and re moved it the work continued The wish that so frightened the patient appeared as the next pathogenic reminiscence that is as the one now required by the logical connection It came about in the following manner The content of the wish at first appeared in the patient s con sciousness which would have transferred this wish into the past Through the associative force prevailing in her consciousness the ex isting wish became connected with my own person with which the patient could naturally occupy herself and in this *mésalliance*—which I call a false connection—the same affect awak ened which originally forced the patient to banish this clandestine wish Now that I have discovered this I can presuppose in every simi lar claim on my personality that this is another transference and false connection It is remark able how the patient falls a victim to deception on every new occasion

No analysis can be brought to an end if one does not know how to meet the resistances re sulting from the causes mentioned The way can be found if one bears in mind that the new symptom produced after the old model should be treated like the old symptoms In the first place it is necessary to make the patient con scious of the obstacle In one of my patients in whom I had cause to assume an unconscious idea like the one mentioned above in 2 I met it for the first time with an unexpected attack I told her that there must have originated some obstacle and then pressed her head She then said surprisingly I see you sitting here on the chair but that is nonsense what can that mean? But now I could explain it.

exert almost no claims on the as ociation work but the separated um of excitement will have to be utilized in an ther direct on

Thus far the p ocesses are the same as in h ena, in phob as and obses ions but from now o their ways part The unbearable idea in h teria is rendered harmless because the sum of excitement is tran formed into ph sical ma festations, a process for which I would like t propose the term *conversion*

The conversion may be total or part al and f lows that motor or ensory innervat on which is e the ult mately or m re loosely connected with the traumat c experience In this way the ego su ceeds in freeing t elf from opposit on but instead it becomes burdened with a mem ory symbol wh ch remains in consciousness as an unadjusted m tor innervat on or as a con stantly recurring hallucinatory sensation imi lar to a parasite It thus remains fixed until a co ers on takes place in the oppo te direct on The memory symbol f the repressed idea doe not perish b t from now on forms the nucleus fo a sec nd psychic group.

I will follow up this view of the psycho-phys ical processes in hysteria with few more words. If such a nu leus f r an hysterical spl t ting s once f rmed in a *traumatic moment* it th n increases in other m ments which m ght be designated as *auxil ary t au mat c* as soon as a newly formed simila impre sion succeeds in breakin, through the barrier formed by the ill and in addi g new affect to the weakened wh l the a soci ti e

in most cases. As shown by the f miliar con tra t of th attacks and the persi t t symptoms the c t me t whi h was pu hed on a false path (in the bodily innervat n) now a d the returns t the id a from which t was dis charged and f ces the person to a oci ti e elaborat o o to adjustme t in hysterical at tacks. The ffect of Breuer's cathartic method co ts the fact that t con ciously rec n d cts the excit ment f m the physical i to the ps chi spheres and then fo es an adjustm nt f the contradiction through intellectual w k, and discharge of the excit ment through spee h.

rowed consciousness of h steria and causes the plit off psychic groups to become acces i ble For we know that it is peculiar to all sleep-like states to remo e that d stribution of ex citement wh ch depe ds on the will of the con sc ous personality

We accord ngly recognize that the character istic element of hysteria is not the splitting of con c ou ness but the ability of conversion and as an important part of the hitherto un known d posit on of hysteria we can ment on the psycho-phys cal adaptat on for the trans ference of a great um of exc tement into bodily innervatio

The adaptation does not in itself exclude psy chic health and leads to hysteria only in e ent of a psychic incompatibility or accumulat n of excit ment W th this turn we—Breuer and I —come near to the famili r definitions of hys teria of Oppenheim and Strumpel, and d i ate from J et who a gns to the splitt n of co ciou ness too great a rôle in the character istics of hysteria The description here gi en can lay claim to the fact that t explains the connecti n between the con ers on and the hys terical splitting of con ciousness.

II

If there is no ad ptat on for convers on in a predisposed person and an ffort is neverthe-less made to separate an unbearable idea from its affect f r th purpose of d fence, the aff ct must then remain in the psychic sphere The weakened id a remains apart from all as oci tion n consciousness but its freed affect at taches itself to other not in themsel es unbear able ideas which on account of this false connection become obsessions This is in brief the psychological theory of the obsessions a d phob as concernin which I have spoken abo e

I shall now state what parts demanded in this theory can be directly demonstrated a d

Oppe he m Hys ia is exaggera ed xpressi f mo ion. B t the "expressio f m ion repre-se tha mou t f psychi cl eme t which m hy xperiences conversion

Strümpel The d tu bance f hyst ria lies i th psycho-phys cal there where the physical d psy hical re connec ed w h ch the

J i the seco d hap f h spl itted essay Qu lque dé ns c., has tre ed the bjec ha h pli g f consci usness bel gs also th psychoses d th so-called psychaestheni b

the formation of separate psychic groups has been generally recognized since the interesting works of P Janet J Breuer and others Less understood are the opinions concerning the origin of this splitting of consciousness and concerning the role played by this character in the structure of the hysterical neuro es

According to Janet s theory the splitting of consciousness is a primary feature of the hysterical alteration It is due to a congenital weakness of the capacity for psychic synthesis and to a narrowing of the *field of consciousness* (*champ du conscience*) which as a psychic stigma confirms the degeneration of hysterical individuals

In contradistinction to Janet s views which in my opinion admit the most manifold objections are those advocated by J Breuer in our jo n

ci

w a a nallowed association capacity for which he proposed the name *hypnoid states* The splitting of consciousness is secondary and acquired and originates because the ideas emerging in the hypnoid states are isolated from associative communication with the rest of consciousness

I can now demonstrate two other extreme forms of hysteria in which it is impossible to show that the splitting of consciousness is primary in the ense of Janet In the first of these forms I could repeatedly show that the splitting of the content of consciousness was an arbitrary act of the patient that is it was initiated through an exertion of the will the motive of which can be stated I naturally do not maintain that the patient intended to produce a splitting of his consciousness the patient s intention was different but instead of attaining its aim it produced a splitting of consciousness

In the third form of hysteria as we have demonstrated by psychic analysis of intelligent patients the splitting of consciousness plays only an insignificant and perhaps really no role This includes those cases in which there had been no reaction to the traumatic stimulus and which were then adjusted and cured by ab reaction They are the pure *retention hysterias*

In connection with the phobias and obsessions I have only to deal here with the second form of hysteria which for reasons to be presently explained I will designate as *defence hysteria* and thus distinguish it from the hypnoid and retention hysterias Preliminarily I am able to call my cases of defence hysteria *acquired* hysterias for they show neither marked hereditary taints nor any degenerative stigmata

In those patients whom I have analyzed there existed psychic health until the moment in which a case of incompatibility occurred in their ideation that is until there appeared an experience idea or feeling which evoked such a painful affect that the person decided to forget it because he did not trust his own ability to remove the resistance between the unbearable ideas and his ego

Such incompatible ideas originate in the feminine sex on the basis of sexual experiences and feelings With all desired precision the patients recall their efforts of defence their intention to push it away not to think of it to repress it As appropriate examples I can easily cite the following cases from my own experience A young lady reproached herself because while nursing her sick father she thought of a young man who made a slight erotic impression on her a governess fell in love with her employer and d d d

because

I am ı

the will ıı crowding such thoughts out of one s mind is a pathological act nor am I able to state whether and how the intentional forgetting succeeds in these persons who remain well under the same psychic influences I only know that in the patients whom I analyzed such a *forgetting* was unsuccessful and led to either hysteria obsession or a hallucinatory psychosis The ability to produce by the exertion of the will one of these states which are connected with the splitting of consciousness is to be considered as the expression of a pathological predisposition but it need not necessarily be identified with personal or hereditary *degeneration*

From the road leading from the patient s exertion of the will to the origin of a neurotic symptom I formed a concept which in the current psychological abstractions may be expressed as follows The task assumed by the defensive ego to treat the incompatible idea as *non arrivée* can not be directly accomplished The memory trace as well as the affect adhering to the idea are here and can not be exterminated The task can however be brought to an approximate solution if it is possible to change the strong idea into a weak one and to take away the affect or sum of excitement which adheres to it The weak idea will then

Et t m t l d s hy té q s F 893 d
894 *Q elq déf t é t s d l hy té ie*
A ch de N l 893 XXXV VI

exert almost no claims on the a ociation work but the separated um of ex itement will have to be utuized in another direction

Thus f r the processes are the same as in h stena in phobias and bses o s but from now n their ways part The unbearable idea m h na is rend red harmless because the m f excitement is tran f rmed int phy cal manifestations a process for which I would like to propose the term *co ersion*

The convers n may be total r partial and f ll ws that motor or sensory nnervatio which is either ultimately or more loosely c nn cted with the traumatic experience In this way the ego succeeds in freeing tself from oppos tion but instead t becomes burdened with a mem ory symbol which remains in consciousness as an unadjusted motor innervat on or as a con l cinatory sen ati n simi

n t pen h b t from now on forms tu f r second psychic group

I will follow up this view of the psycho-physical processes in hysteri with a f w more hyst rical spl t

will and in a ull c l idea and in forcin fo a while th associati e tm of both psychic gr ups until a new c n ers on p od es d fence Th condition thus attained in hyst ria in regard to th di tribu tion f the cit ment, p oves to be unstable in most cases. As shown by the familiar c n trast f the ttacks and the pers stent symptoms th exc t ment which was pu hed o a false path (in th bodily inn rvat on) now and then returns t the de from which t was di charged nd f ces the pers n to as ciati e elaborati or t adjustment in h sterical at ta ks Th ffect of Breuer s cathartic method co sits in the fact that t co sciou ly rec n d cts the excitement from th physical i to the psych c sph res and then forces an adj tme t f the co tradiction throu h ntell ctual wo k, and discharge of the e citement throu h speech.

If th splitting f consci sness in a quired hysteria is due t an ct f volitio we can plain with surpri ing simpli ty the remarkable fact that hypnosis regula ly b oaden the narrowed consc ou ness of hysteria and causes the plit off psychic groups to become acces i ble For we know that it is peculiar to all sleep-like states to remove that distribution of ex citement which depends on the *will* of the con sci us personality

We accordingly recognize that the characteristic element of hysteria is not the splitting of consc ou ness but the ab lity of conversion and as an important part of the hitherto un known disposit on of hysteria we can mention the psycho-phys cal adaptation for the tra s-fe ence of a great sum of excitement into bodi

psy vent on of and I hys teria of Oppenheim and trumpe an de i ate from Janet who as gns to the splittin of con ciousness too great a role in the characteristics of hysteria The description here given can lay claim to the fact that t explains the connecti n between the convers on and the hysterical splitting of consciousness.

II

If there is no adaptation for conversion in a predisposed person and an effort is ne rthe less mad to separate an unbearable idea from its affect fo the purpose of defe ce the affect must then remain in the psychic sphere The

I shall now state what parts demanded in this theory can be directly demonstrated nd

Oppenhe m Hyst ria is exa gerated xpressi f m B t the xpress f m tion repre se ts tha moun f psychi exci ement which mally experiences conversion

Strumpel The distu ban f hysteria lies i the psycho-phys cal th re where the physical and psy chical re connected with each the

Jan t i the second chap f his spirited essay *Qu lque dé* *ni* c., has tre ted the bjec tha the pl f consciousness bel nes also the psychoses d the so-called psychaesthenia b t in m pin he has t satisf ctorily solved it. It sse ially this ob ecti h h urged h m to call hysteri f rm f degenera B thro gh hara ri i h bl separate sufficiently the hys rical pli g f nsci usnes from the psycho-pathi etc.

what parts I have *supplemented* Besides the end product of the process the obsession we can in the first place directly demonstrate the source from which the affect in the false con*nection originates In all cases that I have ana*lyzed it was the sexual life that has furnished a painful affect of precisely the same character as the one attached to the obsession It is not theoretically *excluded that this affect could not* occasionally originate in other spheres but I must say that thus far I have found no other origin Moreover one can readily understand that it is precisely the sexual life which furnishes the most manifold occasions for the appearance of unbearable ideas

Moreover the exertion of the will the attempt at defence upon which this theory lays stress is demonstrated by the most unequivocal utterances of the patients At least in a *number of cases the patients themselves inform* us that the phobia or obsession appeared only after the exertion of the will manifestly gained its point Something very disagreeable hap*pened to me once and I have exerted all my* power to push it away not to think of it When I have finally succeeded I have gotten the other thing instead which I have not lost since With these words a patient verified the main points of the theory here developed

Not all who suffer from obsessions are so clear concerning *the origin of the same As a* rule when we call the patient s attention to the original idea of a sexual nature we receive the following answer It could not have come from that Why *I have not thought much about it* For a moment I was frightened then I distracted myself and since then it has not bothered me In this so frequent objection we have the proof that the obsession represents a compen ation or substitute for the unbearable sexual idea and that it has taken its place in con*sciousness*

Between the patient s exertion of the will which succeeds in repressing the unacceptable sexual idea and the appearance of the obsession which though in itself of little intensity is here furnished with an inconceivably strong affect there is a yawning gap which the theory here developed will fill The separation of the sexual idea from its affect and the connection of the latter with another suitable but not unbearable idea—these are processes which take place unconsciously which we can only presume but not prove by any clinico psychological analysis Perhaps it would be more correct to say *that* these are not really processes of a psychic nature but physical processes of which the psychic result *so presents itself that the ex*pressions separation of the idea from its affect and false connection of the latter seem *actual* occurrences

Besides the ca es evincing in turn the sexual unbearable idea and the obsession we find a series of others in which there are simultaneously *obsessions* and *painfully* accentuated *sexual* ideas It will not do very well to call the latter *sexual obsessions* they lack the essential character of obsessions in proving them elves fully *justified whereas the painfulness of the ordi*nary obsession is a problem for the doctor as well as the patient From the amount of insight that could be obtained in such cases it eems that *we deal here with a continued defence* against sexual ideas which are constantly renewed a work heretofore not accomplished

As long as the patients are aware of the ex ual origin of their obsessions they often conceal them If they complain they generally express surprise that this affect is behind the *symptoms that they are afraid and that they* have certain impulses etc To the experienced physician however the affect appears justified and intelli ible and the only thing he finds peculiar is the *connection of such an affect* with an idea unworthy of it In other words the affect of the obsession appears to him as one dis*located or transposed* and *if he has accepted* the observations laid down here he can in many cases retranslate obsessions into the sexual

Any idea which either through its character *may be combinable with an affect of such* quali ty or which bears a certain relation to the unbearable by virtue of which it seems a suitable substitute for it may be used for the secondary connection of the freed affect Thus for example freed anxiety the sexual origin of which can not be recalled attaches itself to the *common primary phobias of man for animals* thunderstorms darkness etc or to things which are unmistakably in some way associated *with the sexual* such as *urination defecation* pollutions and infections

[illegible] ed by th ego n the trans [illegible] of de [illegible] sterical conversion of psychic excitement into omatic innervation The affect under which the ego has *suffered remains now as ever unchanged and* undimini hed but the unbearable idea is suppressed and excluded from memory The repressed ideas *again form the nucleus of a* ec ond psychic group which I believe can be ac

cessible without ha ing recourse to h pnotism. That in the ph bias and obsess ns there appear non of the triking symptoms which in hysteria ccompan the formation of an independent psychic group is d e to the fact that in the f rmer case the whole transformation remains in the psychic sphere whil the o- ma mn rvation experiences n change.

What I ha e here said concernin bsessions I will explain by some examples which are probably of a typical nature

1. A young gi l suffers from obsessive reproaches. If he reads anything in the newspapers about counterfeiters she con e ves the thought that she too mad counterfe t money

the same tim he is perfectly aware of the absurdity of these bsessi e reproaches For a time the consciousnes of her guilt has gained such power over her that her judgment was suppressed and she ccused herself before her relatives and physician f ha ing really com mitted all these crimes (Psychos through simple aggra ation — overwhelming psychosis —

in this treatment and strict watching

2 An th gi l suffered from the fear f getting sudde desires f micturiti n and of being fo ced t wet herself This began after such a des e had really f rced h r to lea e a concert hall during the performance This ph bia had gradually caused her t bec m quite incapa b f any enjoyment and ocial relation hip She f lt secure nly when she knew that th re was a toil t ea by to which she ould repair un bserved. An organic sufferin, which might ha e justified th lack of co fidence of the control f the bladder was excluded. At h me among qu t surroundings and durin the night ther was no such desire to micturate. D tailed examination howed that the desire to mictu ra ppeared f r the first tim under the f l lowing conditions A gentleman to wh m he was not indifferent took seat in the oncert hall o far from her She began to think and to picture to herself how she would sit near him as his wife In this erotic reverie she experienced that physical feeling which must be compared to an erection in the man and which in her—I do not know whether it is general—ended in a slight des re to micturate. She now became extremely frigh ened o er her other wi e accustomed sexual ensation because he had determined to overcome this as well as every desire and in the next moment the affect transposed itself to the accompanying desire to micturate and forced her to lea e the hall after a ery painful struggle In her life she was so prudish that she experienced an intensive horror for all things sexual, and could not conce e the thought of ever marrying on the other hand he was sexually so hyperesthetic that during every erotic revery which she gladly entertained there appeared sensual feeling The erecti n was always accompanied by the desire to micturate and up to the time of the scene in the concert hall it had made no impression on her The treatment led to an almost complete control of the phobia.

3 A young woman who had only one child aft r five years of married life complained of obsessi e impulses to throw herself from the window balcony and of fears lest at the sight of a sharp knife she might kill her child Sh admitted that the marriage relations were eld m practised and then only with ca tion against conceptio but he added that she did not miss this as he was not of a sensual nature I then entured to tell her that at the sight of a man she conce es erotic ideas and that he th ref re lost confidence in herself and imagi ed herself a depra ed person fit for anything The retranslation of the obsession into the sexual was successful weepin she soon admitted her long concealed marital misery and then me tio ed painful ideas of an unchanged sexual character such as the often recurring sensation of something forcing itself und her kirts.

I ha e mad use of such experiences in the therapy f phobias and obses ions, and desp te the patient s resistances I ha e redirected the ttention to the repressed sexual ideas, and wherever feasible I ha e blocked the sources from which the same riginated. To be sure I cannot maintain that all ph bias and obsessions originat in the manne here revealed first, my experi ce in proportion t the abundance of these neuroses embraces nly limited am unt and sec d I, myself know that these *psy hasthenic* symptoms (ac rding to Janet s

designation) are not all of the same value Thus for instance there are pure hysterical phobias But I believe that the mechanism of the displacement of the affect will be demon strated in the greater part of the phobias and obsessions and I must assert that these neu roses which are found just as often isolated as combined with hysteria and neurasthenia are not to be thrown together with the ordinary neurasthenia for which fundamental symptom a psychic mechanism is not at all to be assumed

III

In both cases thus far considered the de fence of the unbearable idea was brought about by the separation of the same from its affect the idea though weakened and isolated re mained in consciousness There exists how ever, a far more energetic and more successful form of defence wherein the ego misplaces the unbearable idea with its affect and behaves as though the unbearable idea had never ap proached the ego But at the moment when this is brought about the person suffers from a psy chosis which can only be classified as an *hallu cinatory confusion* A single example will ex plain this assertion A young girl gives her first impulsive love to a man who she firmly be lieved reciprocated it As a matter of fact she was mistaken the young man had other mo tives for visiting her It was not long before she was disappointed at first she defended herself against it by converting hysterically the corre sponding experience and thus came to believe that he would come some day to ask her in mar riage but in consequence of the imperfect con version and the constant pressure of new pain ful impressions she felt unhappy and ill She finally expected him with the greatest tension on a definite day it was the day of a family reunion The day passes but he did not come After all the trains on which he could have come have passed she suddenly merged into an hallucinatory confusion She thought that he did come she heard his voice in the garden and hastened down in her nightgown to receive him For two months thereafter she lived in a happy dream the content of which was that he was as before (before the time of the painful ly defended disappointment) The hysteria and depression were thus conquered during her sickness she never mentioned anythin about the last period of doubt and suffering she was happy as long as she was left undisturbed and was excited only when a regulation of her en vironment prevented her from accomplishing something which she thought quite natural as a result of her blissful dream This psychosis unintelligible as it was in its time was revealed ten years later throu h hypnotic analysis

The fact to which I call attention is this That the content of such an hallucinatory psy chosis consists in directly bringing into promi nence that idea which was threatened by the motive of the disease One is therefore justi fied in saying that through its flight into the psychosis the ego defended the unbearable idea the process through which this has been brought about withdraws itself from self per ception as well as from the psychological clini cal analysis It is to be considered as the ex pression of a higher grade of a pathological pre disposition and can perhaps be explained as follows The ego tears itself away from the unbearable idea but as it hangs inseparably together with a part of reality the ego while accomplishing this performance also detaches itself wholly or partially from reality The lat ter is in my opinion the condition under which hallucinatory vividness is decreed to particular ideas and hence after a very successful de fence the person finds himself in an hallucina tory confusion

I have but very few analyses of such psy choses at my disposal but I believe that we deal with a very frequent type of psychic ill ness For analogous examples such as the moth er who becoming sick after the loss of her child continues to rock in her arms a piece of wood or the jilted bride who in full dress ex pects her bridegroom can be seen in every mental hospital

It will perhaps not be superfluous to men tion that the three forms of defence here con sidered and hence the three forms of disea e to which this defence leads may be united in the same person The simultaneous occurrence of phobias and hysterical symptoms so fre quently observed in practice really belong to those factors which impede a pure separation of hysteria from other neuroses and force the formation of a *mixed neurosis* To be sure the hallucinatory confusion is not frequently com patible with the continuation of hysteria and not as a rule with obsessions but on the other hand it is not rare that a defense psychosis

Th g o p f typ c l ph b f r wh h g phob s a p t typ c t be d ced to th p y ch mecha m he de l ped F th m re th mecha m of g ph b d t d p t f m th t f th re l ob si d f m ph b b sed o ch He th e i o r p sed d f om wh h th ffect f f h s be sep ated The fear of this ph b a has a the ig

shed episodical v b ak through th course of an hysteria r mixed u osis

In conclusion I will mention in a few words the s bsidiary dea f which I ha e made use in this discussion of th def nce neuroses It is the idea that there is somethi g to di tinguish in all psychic functions (amount of affect sum of excit ement) that all qualit es ha e a quantity though we ha e n means to measure the same—it is somethin that can be increased, diminished, displaced, and discharged and that extends over the mem ry traces of the ideas perhaps like an electric charge o er the surface of the body

This hypothesis which also unde lies our theory f ab-r act on (Preliminary Communi cation) can be used in the same sense as the physicist uses the a umption of the current of electric fluid. It is preliminarily justified through its usefulnes in th comprehension and el cidation of di erse psychic tates

CHAPTER 6

ON THE RIGHT TO EPAR TE FROM NEURAS THENIA A DEFINITE SYMPTOM-COMPLEX AS ANXIETY NEUROSIS (*A gst uro e*)

It is difficult to assert anything of gen ral va lidit concernin eurasthenia as lo as this term allowed to xpress all that f r which Beard used it I believe that n uropathology can only gain by an attempt to eparate f om t actual eurosis ll those neur t c disturbances th symptoms f which are n the one hand m re firml connected am ng themsel es than t the typical eurasthenic ymptoms s h as headach spinal irritation dyspeps a with fla ulence nd onstipat on d which on the ther hand h w essential diff ren es from

do- eurasthenias such as th rganically de termined nasal re ex neurosis th eurotic disturbances f ca hexi s and rteriosclero the earl st ges f pr gressi e paraly s and f some psychoses. Furthermore f ll win the propos ti f Moeb us m s at errosi of h reditary degen rates will be set a d d we will also fi d reasons f ascribin to melancholia m f the euroses which are now called neurasthenia, especially those of an intermit

tent or periodic nature But we force the way into the most mark d changes if we decide to separate from neura thenia that symptom-com plex which I hall hereafter describe and which especially fulfills the condit ons formulated abo e The symptoms of this compl x are cl n cally more related to one another than to the real neurasthenic symptoms that is they fre quently appear together and substitute one an other in th course of the disease and both the aetiology as well as the mechani m of this neu rosis differs bas cally from the aetiology and the mechanism of the real neura thenia which remains after such a separation.

I call this symptom-complex *anxiety neuro sis* (*Angstn urose*) becau e the sum of its com ponents can be grouped around the main symp toms of anxiety becau e each indi idual symp tom hows a definite relation to anxiety I believed that I was original in this co cept on of the sympt ms of anxiety neuro is until an int restin lecture by E. Hecker[a] fell into my hand. In this lecture I found the description of the same interpretat on with all the desired learness and compl teness T be sure Hecker does not separate the equi alents or rudiments f the attack f nxiety from neurasthenia as I intend t do but this is apparently d e t the fact that e ther here nor there has be taken into a count the diversity of the etiolog cal determinants. With the kn wledge of th latter difference every obligation to des gnate th anxiety neurosis by the same name as the real neura thenia disappears for the nly object f arb trary namin is to f cilitate the formulati of general assertions.

1 Cl ni al Symptomatology of Anxiety Ne osis

What I call *anxiety eurosis* can be observed in c mpl te rudimentary de elopme t e ther isolated or in combinati n with other neu roses. The ca es which are in a mea ure com plete and at the same time isolated are natu rally those whi h especially corroborate the impress n that the anxiety neurosis po se ses clinical independence In other cases we are fro ted with the ta k of sele ting and epa rating from a sympt m-compl which corre ponds t a *mixed eur sis* all those symptoms which do not belon t neurasthenia hysteria etc., b t t the anxiety neurosis.

F st pu l hed in the Neurol g h Zentralblatt 893 No.

[a] E. Hecker Uber larvierte und bortiv Angst zustande bei Neurasthenie Zen albl t f Nervenheilkund December 893 — Anxiety is mad

The clinical picture of the anxiety neurosis compri es the following symptoms

1 *General Irritability* This is a frequent *nervous symptom common as such as to many* nervous states I mention it here because it con stantly occurs in the anxiety neurosis and is of theoretical importance For increased irritabili ty always points to an accumulation of excite ment or to an inability to tolerate such ac

f

y

hyperesthesia is especially worth mentioning it is an over sensitiveness for noises which symptom is certainly to be explained by the congenital intimate relationship between audi tory impressions and fright Auditory hyperes *thesia is frequently found as a cause of insom* nia of which more than one form belongs to anxiety neurosis

Anxious Expectation I cannot explain better the condition that I have in mind than by this name and by some appended examples Thus a woman who suffers from anxious ex pectation thinks of influenza pneumonia when ever her husband who is afflicted with a catar rhal condition has a coughing spell and in her *mind she sees a passing funeral procession If* on her way home she sees two persons standing together in front of her house she cannot re frain from the thought that one of her children fell out of the window if she hears the bell ring she thinks that someone is bringing her mournful tidings etc yet in none of these cases is there any pecial reason for exaggerat ing a mere possibility

Anxious expectation naturally reflects itself *constantly in the normal and embraces* all that is designated as uneasiness and a tendency to a pessimistic conception of things but as often as possible it goes *beyond such a plausible un* easiness and it is frequently recognized as a part of constraint even by the patient himself For one form of anxious expectation namely that which refers to one s own health we can reserve the old name of *hypochondria* Hypo

— h the

as a

tence

of paresthesias and annoying som ensa tions *Hypochondria is* thus the form preferred by the genuine neurasthenics whenever they merge into the anxiety neurosis a thing which frequently happens

As a further manifestation of anxious expec tation we may mention the frequent tendency observed *in morally sensitive persons to pangs* of conscience scrupulosity and pedantry which varies as it were from the normal to its ag gravation as doubting mania

Anxious expectation is the most essential symptom of the neurosis it also clearly shows a part of its theory It can perhaps be said that we have here a *quantum of freely floating* anxiety which controls the choice of ideas by expectation and is forever ready to unite itself *with any suitable ideation*

3 This is not the only way in which anx iousness usually latent but constantly lurking in consciousness can manifest itself On the contrary it can also suddenly break into con sciousness without being aroused by the is ue of an idea and thus provoke an attack of anx iety *Such an attack of anxiety consists either* of the anxious feeling alone without any a so ciated idea or of the nearest interpretation of *the termination of life* such as the idea of sud den death or threatening insanity or the feel ing of anxiety becomes mixed with some pares thesia (similar to the hysterical aura) or fi nally the anxious feeling may be combined with a disturbance of one or many somatic func tions such as respiration cardiac activity vas *omotor innervation and glandular activity* From this combination the patient renders es pecially prominent now this and now the other factor He complains of heartspasms heavy breathing profuse perspiration inordinate appetite etc and in his description the feeling of anxiety is put to the background or it is rather vaguely described as feeling badly uncomfortably etc

4 What is interesting and of diagnostic signi *ficance is the fact* that the amount of admix ture of these elements in the attack of anxiety varies extraordinarily and that almost any ac *companying symptom can alone constitute the* attack as well as the anxiety itself Accordingly there are rudimentary attacks of anxiety and equivalents *for the attack of anxiety probably* all of equal significance in showing a profu e and hitherto little appreciated richness in forms A more thorough *study of these larvated states* of anxiety (Hecker) and their diagnostic divi sion from other attacks should soon become the necessary work for neuro pathologists

I now add a list of those forms of attacks of anxiety with which I am acquainted There are attacks

(a) With disturbances of heart action such as palpitation with transitory arrythmia with longer continued tachycardia up to grave states

of heart weakness the differentiation of which from organic heart affection is n t always easy among such we have the pseudo-angina pec toris, a delica e diagnostic sphere!

(b) With disturbances of respiration, many forms of nervous d spnoea, asthma like at tacks, etc. I assert tha. even these attacks are not always accompa..ied by conscious a..xiety

(c) Of profuse perspiration, often nocturnal

(d) Of trembling a..d .haki.., which may readily be mistaken for hysterical attacks

(e) Of inordinate appeti e often combined wi.. dizziness

(f) Of diarrhea appearing in the form of attacks

(g) Of locomotor dizziness

(h) Of so-called congestions, embracing all th.. was called vasomotor neurasthenia and,

(i) Of paresthesias (these are seldom without a..xiety or a similar discomfort)

5. Very frequently the nocturnal frights (pavor nocturnus) f dults usually combined with a..xiety dyspnea, perspiration, etc. are nothin.. other than a variety of the attack of a..xiety This disturbance determines a second form of insomnia in the sphere of the anxiety neurosis. Moreover I became convinced that even the pavor ..octurnus of children evinces a form belonging to the anxiety neurosis. The hysterical tinge a..d the connection of the fear with t..e reproduction of appropriate experience or dream, m..kes the pavor nocturnus f chil dren appear as somethin.. peculiar but t also occurs a..one without a dream c a recurring hallucina..ion.

6. Vertigo In ts lightest forms better designated as dizziness assumes a promi..ent place in the group of symptoms of anxiety neurosi.. In its severer f rms the attack of vertigo with ... symp-

is n confined to certain pla..es ... ..es ... h enters vertigo It belongs to t..e locomotor or coordina..ng vertigo like the vertigo in pa ralys..s of the ocu..ar muscles t consists in specif..c fee..ng f d..scomfort which is ccom pa..ed by sensations of a hea ing ground, sink ..g legs, of the impossibil..y t con..inue in an uprig t position, and t the same time there is a feeling that the legs are as heavy as lead, they s..ake, g..e awa This vertigo never leads t fa....g On the other hand I would like to state t..at such an ta k f vertigo may also be substi uted by profound ttack f syn cope. Other fa..ting lik sta..es in t..e anxiety neuros..s seem to depend on a cardiac collapse.

The vertigo attack is frequently accompa nied by the worst kind of anxiety and is often combined with cardiac and respiratory disturbances Vertigo of elevations mountains and precipices, can also be frequentl observed in anxiety neurosis moreover I do not know whether we are still justified in recogni..... a vertigo a stoma..cho l..e o

On the ba.. s of the chronic anxiousness (anxious expectation) on the one hand and the tendency to vertiginous attacks of anxiety on the other there develop two groups of typical phobias the first refers to the general physiological menaces while the second refers to locomotion. To the first group belong the fear of snakes thunderstorms, darkness vermin etc., as well as the typical moral overscrupulousness a..d the forms of doubting mania Here the a ailable fear is merely used to trengthen those a ersions which are instincti ely im pla..ted in every human being But usually a compul..ively acting phobia is formed only after a remini..cence is added to an experience in which this fear could manifest itself as for example, after the patient has experienced a storm in the open air To attempt to explain such cases as mere continuations of trong im pressions is incorrect. What makes these experiences ignificant and their reminiscences dur able is after all, only the fear which could at that time appea and can also appear today In other words, such impressi ns remain f c ful only in persons with anxious e pect t ons

The other group co tains agoraph bia with all its accessory forms all of which are cha acterized by th r relation to locomotion. As a det rmination of the phobia, we frequently find a precedent attack of vertigo I do not think that it can always be postulated Oc ca..ionally after a first attack of vertigo without fear we see that though locomo on is al ways accompanied by the sensatio..s f vertigo t remains possible without any restrictions but as oon as fear ttaches tself to the attack f vertigo locom tion fails under the condi tions of bein.. alone narrow treet. tc.

The relation of these phobias t the phobias of bsessions, which mecha..ism I di..cus ed above is as follows The agreement lies in the f ct that, here as there a dea bec mes obsessive through ..s connection wi..h an a ail able a..ect. The mech....ism f displacement of the affect therefore holds true for both kinds

From onset st mach.—Ed
The D ... Neuro-P ych

p. 8 ... above.

of phobias But in phobias of the anxiety neurosis this affect is (1) a monotonous one it is always one of anxiety (2) it does not originate from a repressed idea and on psychological analysis it proves itself not further reducible nor can it be attacked through psycho therapy The mechanism of substitution does not therefore hold true for the phobias of anxiety neurosis

Both kinds of phobias (or obsessions) often occur side by side though the atypical phobias which depend on obsessions need not necessarily develop on the basis of anxiety neurosis A very frequent ostensibly complicated mechanism appears if the content of an original simple phobia of anxiety neurosis is substituted by another idea the substitution is then subsequently added to the phobia The *protective measures* originally employed in combating the phobia are most frequently used as substitutions *Thus for example from the effort to* provide oneself with counter evidence that one *is not crazy contrary to the assertion of the* hypochondriacal phobia there results a reasoning mania The hesitations doubts and the many repetitions of the *folie du doute* originate from the justified doubt concerning the certainty of one s own stream of thoughts for through the compulsive like idea one is surely conscious of so obstinate a disturbance etc It may therefore be claimed that many syndromes of compulsion neurosis like *folie du doute* and similar ones can clinically if not notionally be attributed to anxiety neurosis

8 The digestive functions in anxiety neurosis are subject to very few but characteristic disturbances Sensations like nausea and sickly *feeling are not rare and the symptom of in*ordinate appetite alone or with other congestions may serve as a rudimentary attack of anxiety As a chronic alteration analogous to the anxious expectations one finds a tendency to diarrhea which has occasioned the queerest diagnostic mistakes If I am not mistaken it is this diarrhea to which Moebius has recently called attention in a small article I believe moreover that Peyer s reflex diarrhea which he attributes to a disease of the prostrate is nothing other than the diarrhea of anxiety neurosis The deceptive reflex relation is due to the fact that the same factors which are active in the origin of such prostatic affections also come into play in the aetiology of anxiety neurosis

The behaviour of the gastro intestinal function in anxiety neurosis shows a sharp contrast to the influence of this same function in neurasthenia Mixed cases often show the familiar fluctuations between diarrhea and constipation The desire to urinate in anxiety neurosis is analogous to the diarrhea.

9 The paresthesias which accompany the attack of vertigo or anxiety are interesting because they associate themselves into a firm sequence similar to the sensations of the hysterical aura But in contrast to the hysterical aura I find these associated sensations atypical and changeable Another similarity to hysteria is shown by the fact that in anxiety neurosis a kind of conversion into bodily sensations as for example into rheumatic muscles takes place which otherwise can be overlooked at *one s pleasure A large number of so-called* rheumatics who are moreover demonstrable as *such really suffer from an anxiety neurosis* Besides this aggravation of the sensation of pain I have observed in a number of cases of anxiety neurosis a tendency towards hallucinations which could not be explained as hysterical

10 Many of the so called symptoms which accompany or substitute for the attack of anxiety also appear in a chronic manner They are then still less discernible for the anxious feeling accompanying them appears more indistinct than in the attack of anxiety This especially hold true for the diarrhea vertigo and paresthesias Just as the attack of vertigo can be substituted for by an attack of syncope so *can the chronic vertigo be substituted for by* the continuous feeling of feebleness lassitude etc

II *The Occurrence and Aetiology of Anxiety Neurosis*

In some cases of anxiety neurosis no aetiology can readily be ascertained It is noteworthy that in such cases it is seldom difficult to demonstrate a marked hereditary taint

Where we have reason to assume that the neurosis is acquired we can find by careful and — ef tries at first appear to be of a varied nature but easily display the common character which explains their homogeneous effect on the nervous sys

Obs s o s a d Phob as (895) *C ll ct d P p s* I

tem. They are found either alone or with other bed injures to which a reinforcing affect can be attribu ed. This sexual aet ology of anxiety neurosis can be demonstrated o preponder a y o en that I en ure for the purpose of this b ef communication to set aside all cases of a doubtful or different aetiology

For t e more precise description of the aetiological determinations under which anxiety neurosis occurs, it will be advisable to treat separately those occurring in men and those occurring in women. Anxiety neurosis appears in women—disregarding their predisposition—in the following cases

(a) As virginal fea or anx ty in adults A number of unequivocal bservati ns howed me that an anx ty neurosis which is almost typically combined with hyst ria, can be evoked in maturing girls at the first encounter with the sexual problem, that is at the sud den revelation of the things hitherto veiled by either seeing the sexual act or by hearing or reading something of that nat re

(b) As fear in the newly married. Young women wh remain anaesth tic during the first co ab ation not seldom merge into an anxiety neurosis which disappears after the anaesthesia is displaced by the normal sensati n. As most young women remain undisturbed through such a beginning anaesthesia, the production of this fear requires determinants which I will men tion

(c) As fear in women whose husbands uffer from jaculatio precox or from diminished potency and,

(d) In those whose husbands practice coitus interrup us or e ervatus These cases go together for on analyzing a large number of ex amples one can easily be convinced that they only depend on whether the woman attained gratifica on during co tus o n t. In the latter case one finds the d terminant for the rigin of anxiety neurosis On th other hand the w man is spared from the neurosis if the husband af flicted by jaculatio pre can repeat the con gress with better results immediately there after The congr s us eservatus by means of the condom is n t injurious to th w man if she is quickly excited and the husband is very potent in ther cases, the noxiousness of this kind of preventive measure is n t inferio to the others. Coitus nterruptus is almost reg ula ly injurious but f the woman it is in jurious only if the husband practices t regard les ly that is, I he terrupts c tus as soon as he comes near ejaculating without concerning himself about the termination of the excitement of his wife. On the other hand if the husband waits until his wife is gratified the co tus has the same s gnificance for the latter as a normal one but then the husband becomes afflicted with an anxiety neurosis. I have col lected and analyzed a number of cases which furnished the material for the above statements.

(e) As fear in widows and intentional abstainers, not seldom in typ cal combination —

originates in the female sex, mo t frequently and most independently of hereditary predis position. I will endeavour to demonstrate in these—curable acqu red—ca es of anxiety neu rosis that the d covered —

sexual determinants of anxiety neurosis in men. I would like to formulate the following groups every one of which finds its analogy in women

(a) Fear of the intentional abstainers this is frequently comb ned with symptoms of defence (obsessions hysteria) The motives which are decisive for intentional ab tinence carry along with them the fact that a number of hereditari ly burdened eccentrics etc., belong to this category

(b) Fear in men with fru trated excitement (during the engagement period) persons who out of fear for the con equences of sexual re lations satisfy themselves with handling or looking at the woman. This group of determi nants which can moreover be transferred to the other sex—engagement periods, relations with sexual fo bearance—furnish the purest cases f the neurosis.

(c) Fear in men who practice coitus interruptus As bserved bove co — —
in
th
t
fi an, he voluntarily controls the co tus by delaying the ej culation. In this manner we can understand why it is that in couples who practi e o tus interruptus it is usually only one of them who becomes afflicted. M reover the coitus in erruptus only rarely produces in man a pure anxiety eurosis usually it s a mixture of the same with neura thenia.

(d) Fear in men in sen m There are men

who show a *climacterium* like women and merge into an anxiety neurosis at the time when their potency diminishes and their libido increases

Finally I must add two more cases holding true for both sexes

(e) Neurasthenics merge into anxiety neurosis in consequence of masturbation as soon as they refrain from this manner of sexual gratification These persons have especially made themselves unfit to bear abstinence

What is important for the understanding of the anxiety neurosis is the fact that any noteworthy development of the same occurs only in men who remain potent and in non anesthetic women In neurasthenics who on account of masturbation have markedly injured their potency anxiety neurosis as a result of abstinence occurs but rarely and limits itself usually to hypochondria and light chronic dizziness The majority of women are really to be considered as *potent* a real impotent that is a real anesthetic woman is also inaccessible to anxiety neurosis and bears strikingly well the injuries cited above

How far we are perhaps justified in assuming constant relations between individual aetiological factors and individual symptoms from the complex of anxiety neurosis I do not care to discuss here

(f) The last of the aetiological determinants to be mentioned seems in the first place really not to be of a sexual nature Anxiety neurosis originates in both sexes through overwork exhaustive exertion as for instance after sleepless night nursing the sick and even after serious illness

The main objection to my formulation of a sexual aetiology of anxiety neurosis will probably be based on the argument that such abnormal relations of the sexual life exist very frequently that they will be found wherever one will look for them and that their occurrence in cases of anxiety neurosis does not therefore demonstrate the aetiology of this neurosis It may also be argued that the number of persons practicing *coitus interruptus* etc is incomparably greater than those who are burdened with anxiety neurosis and that the overwhelming number of the former are quite well in spite of this injury

To this I can answer that we certainly need not expect a rare aetiological factor in the neuroses especially in anxiety neurosis which everyone concedes are enormously frequent Moreover this very finding really fulfills a pathological postulate if an aetiological examination shows that the aetiological factor can be more frequently demonstrated than its effect, for the latter requires still other determinants (predisposition summation of the specific aetiology reinforcement through other banal injuries) and furthermore the detailed analysis of suitable cases of anxiety neurosis show quite unequivocally the significance of the sexual factor I shall however confine myself here to the aetiological factor of *coitus interruptus* and will render prominent obvious individual experiences

1 As long as anxiety neurosis in young women is not yet constituted but appears in fragments and again spontaneously disappears it can be shown that every such shift of the neurosis depends on a coitus lacking gratification Two days after such behaviour and in persons of little resistance the day after there regularly appears the attack of anxiety or vertigo to which all the other symptoms of the neurosis attach themselves they abate again on rarer marital relations An unexpected journey of the husband a sojourn in the mountains causing a separation of the married couple does good the benefit from a course of gynecological treatment is due to the fact that during its continuation the marriage relations are stopped. It is noteworthy that the success of a local treatment is only transitory the neurosis reappears in the mountain resort if the husband joins his wife for his own vacation If in a not as yet constituted neurosis a physician aware of this aetiology causes a substitution of the *coitus interruptus* by normal relations there results a therapeutic proof of the assertion here formulated The anxiety disappears and does not return unless there be a new or similar cause

In the anamnesis of many cases of anxiety neurosis we find in both men and women a striking fluctuation in the intensity of the appearances in both the coming and going of the whole condition This year was almost wholly good the following was terrible etc on one occasion the improvement occurred after a definite treatment which however failed to produce a response at the next attack If we inform ourselves about the number and the sequence of the children and compare this marriage chronicle with the peculiar course of the neurosis the result of the simple solution shows that the periods of improvement or well being corresponded with the pregnancies of the woman during which naturally the occasions for

preventive relations were unnecessary The treatment which benefited the husband be it Father Kneip's or hydrotherapy was the one which he had taken after his wife was pregnant

3. From the anamnesis of patients we often find that the symptoms of the anxiety neurosis are relieved at a certain time by another neurosis, perhaps a neurasthenia which has supplanted it. It can then be regularly demonstrated that, shortly before this change of the picture there occurred a corresponding change in the form of sexual injury

Whereas such experiences which can be augmented at pleasure plainly obtrude upon the physician the sexual aetiology for a certain category of cases, other cases which would have otherwise remained incomprehensible can at least without gainsaying be solved and classified by the key of the sexual aetiology We refer to those numerous cases in which everything exists that has been found in the former category such as the appearance of anxiety neurosis on the one hand and the specific factor of *coitus interruptus* on the other but yet [illegible]

above all, I would expect that the overworked student would acquire a cephalasthenia and that the mother in our example an hysteria That both became afflicted with anxiety neurosis causes me to attach importance to the fact that the mother lived for eight years in marital *coitus interruptus* and that the student entertained for three years a warm love affair with a respectable girl whom he was not allowed to impregnate

These examples tend to show that where the specific sexual injury of the *coitus interruptus* is in itself unable to provoke an anxiety neurosis it at least predisposes to its acquisition The anxiety neurosis then comes to light as soon as the effect of another banal injury enters into the latent effect of the specific factor The former can quantitatively substitute the specific factor but not supplant it qualitatively The specific factor always remains that which determines the form of neurosis I hope to be able to prove to a greater extent this theory for the aetiology of the neurosis

Furthermore the last discussions contain the not in itself improbable assumption that a sexual injury like *coitus interruptus* asserts itself through summation The time required before the effect of this summation becomes visible depends upon the predisposition of the individual and the former burdening of his nervous system. The individuals who bear *coitus interruptus* manifestly without disadvantage really become predisposed by it to the disturbance—anxiety neurosis—which can at any time burst forth spontaneously or after banal otherwise inadequate trauma just as the chronic alcoholic finally develops a cirrhosis or another disease by summation or under the influence of a fever merges into a delirium

III Addenda to the Theory of Anxiety Neurosis

The following discussion claims nothing but the value of a first tentative attempt which judgment should not influence the acceptance of the facts mentioned above The estimation of this *theory of anxiety neurosis* is rendered still more difficult by the fact that it merely corresponds to a fragment of a more comprehensive representation of the neuroses

The facts hitherto expressed concerning the anxiety neurosis already contain some starting points for an insight into the mechanism of this neurosis In the first place the obtaining the assumption that we deal with an accumulation *of excitement*, and then the very important

…ho was seized with an attack of palpitation on hearing of his father's death and who since that time suffered from an anxiety neurosis The case cannot be understood for up to that time this man was not nervous The death of the father well advanced in years did not occur under any peculiar circumstance and it *must be admitted* that the expected natural death of an aged father does not belong to those experiences which are wont to make [illegible]

appearing in other person after a short sexual injury of this nature and without the intervention of another trauma. The same judgment may be pronounced in the case of the woman who merges into an anxiety neurosis after the death of her child or in the case of the student who becomes disturbed by an anxiety neurosis while preparing for his final state examination. I find that here as there *the effect* is not explained by the reported aetiology One must not necessarily *overwork* himself studying and a healthy mother is wont to react to the death of her child with normal grief But,

fact that the anxiety underlying the manifestations of the neurosis is not of psychic derivation Such for example would exist if we found as a basis for the anxiety neurosis a justified fright happening once or repeatedly which has since supplied the source of the preparedness for the anxiety neurosis But this is not the case a former fright can perhaps cause an hysteria or a traumatic neurosis but never an anxiety neurosis As the *coitus interruptus* is rendered so prominent among the causes of anxiety neurosis I have thought at first that the source of the continuous anxiety was perhaps the repeated fear during the sexual act lest the technique will fail and conception follow But I have found that this state of mind of the man or woman during the *coitus interruptus* plays no part in the origin of anxiety neurosis that the women who are really indifferent to the possibilities of conception are just as exposed to the neurosis as those who are trembling at the possibility of it it all depends on which person suffers the loss of sexual gratification

Another starting point presents itself in the as yet unmentioned observation that in a whole series of cases the anxiety neurosis goes along with the most distinct diminution of the sexual libido or the psychic desire so that on revealing to the patients that their affliction depends on *insufficient gratification* they regularly reply that this is impossible as just now their whole desire is extinguished The indications that we deal with an accumulation of excitement that the anxiety which probably corresponds to such accumulated excitement is of somatic ori in so that somatic excitement becomes accumulated and furthermore that this *somatic excitement* is of a sexual nature and that it is accompanied by a decreased psychic participation in the sexual processes—all these indications I ay favour the expectation that the mechanism of the anxiety neurosis is to be found in the deviation of the somatic sexual excitement from the psychic and in the abnormal utilization of this excitement

This conception of the mechanism of anxiety neurosis will become clearer if one accepts the following view concerning the sexual process in man In the sexually mature male organism the somatic sexual excitement is—probably continuously—produced and this becomes a periodic stimulus for the psychic life To make our conceptions clearer we will add that this somatic sexual excitement manifests itself as a pressure on the wall of the seminal vesicle which is provided with nerve endings This visceral excitement thus becomes continuously increased but not before attaining a certain height is it able to overcome the resistances of the intercalated conduction as far as the cortex and manifest itself as psychic excitement Then the group of sexual ideas existing in the psyche becomes endowed with energy and results in a psychic state of libidinal tension which is accompanied by an impulse to remove this tension Such psychic unburdening is possible only in one way which I wish to designate as specific or adequate action This adequate action for the male sexual impulse consists of a complicated spinal reflex act which results in the unburdening of those nerve endings and of all *psychically formed preparations for the liberation of this reflex* Anything else except the adequate action would be of no avail for after the somatic sexual excitement has once reached the liminal value it continuously changes into psychic excitement that must by all means occur which frees the nerve endings from their heavy pressure and thus abolish the whole somatic excitement existing at the time and allow the subcortical conduction to reestablish its resistance

I will desist from presenting in a similar manner more complicated cases of the sexual process I will merely formulate the statement that this scheme can essentially be transferred to the woman despite the problem of the perplexity artificial retardation and stunting of the female sexual impulse In the woman too it can be assumed that there is a somatic sexual excitement and a state in which this excitement becomes psychic evoking libido and the impulse to specific action accompanied by the sensual feeling But we are unable to state what analogy there may be in the woman to the unburdening of the seminal vesicles

We can bring into the bounds of this representation of the sexual process the aetiology of actual neurasthenia as well as of anxiety neurosis Neurasthenia always originates whenever the adequate (action) unburdening is replaced by a less adequate one like the normal coitus under the most favourable conditions by a masturbation or spontaneous pollution while anxiety neurosis is produced by all factors which impede the psychic elaboration of the somatic sexual excitement The manifestations of anxiety neurosis are brought about by the fact that the somatic sexual excitement diverted from the psyche expends itself subcortically in not at all adequate reactions

I will now attempt to test the aetiological determinants suggested before in order to see whether they show the common character for ...ed by me. As the first aetiological factor in the man, I have mentioned intentional abstinence. Abstinence consists in foregoing the specific action which results from libido. Such foregoing may have two consequences: first the somatic excitement accumulates; second, which is more important, it then becomes diverted to another route where there is more chance for discharge than through the psyche. It will then finally diminish the libido and the excitement will manifest itself subcortically as anxiety. Where the libido does not become diminished, or the somatic excitement is expended in pollutions, or where it really becomes exhausted in consequence of repulsion, everything else except anxiety neurosis is formed. In this manner abstinence leads to anxiety neurosis. But abstinence is also the active process in the

...sublimation of the sexual affect another distracting psychic task. Through this psychic distraction too the libido gradually disappears, and the further course is then the same as in the case of abstinence. The anxiety in old age (*climacterium of men*) requires another explanation. Here the libido does not diminish, but, just as in the *climacterium* of women, such an increase takes place in the somatic excitement that the psyche shows itself relatively insufficient for the subjugation of the same.

The subsummation of the aetiological determinants in the woman, under the aspect mentioned, does not afford any greater difficulties. The case of the virginal fears is especially clear. Here the group of ideas with which the somatic sexual excitement should combine are not as yet sufficiently developed. In anaesthetically newly married women, the anxiety appears only if the first cohabitations awakened sufficient amount of somatic excitement. Where the local signs of such excitability (like spontaneous feelings of excitement, desire to micturate, etc.) are lacking the anxiety too stays away. The case of *ejaculatio praecox* or *coitus interruptus* is explained similarly to that in the man by the fact that the libido gradually disappears in the psychically ungratified act, whereas the excitement thereby evoked is subcortically expended. The formation of an

estrangement between the somatic and psychic in the discharge of the sexual excitement succeeds quicker in the woman than in the man and is more difficult to remove. The case of widowhood or voluntary abstinence as well as the case of *climacterium* adjusts itself in the woman as in the man, but in the case of abstinence there surely is in addition the intentional repression of the sexual ideas, for an abstinent woman struggling with temptation must often decide to suppress it. The abhorrence perceived by an elderly woman during her menopause against the immensely increased libido can have a similar effect.

The two aetiological determinants mentioned last can also be classified without any difficulty. The tendency to anxiety of the masturbator who becomes neurasthenic is explained by the fact that such persons easily merge into the state of abstinence after they have so long been accustomed to afford a discharge—to be sure an inadequate one—for every little quantity of somatic excitement. Finally the last case, the origin of anxiety neurosis through a severe illness (overwork, exhaustive nursing, etc.) aided by the efficacy of *coitus interruptus* readily permits this free interpretation. Through deviation, the psyche becomes here insufficient for the subjugation of the somatic sexual excitement, a task which continuously devolves upon it. We know how deeply the libido can sink under the same conditions and we have here a nice example of a neurosis which, *although it ... a sexual ... logy still ... ces a sexual mechanism*.

The conception here developed represents the symptoms of anxiety neurosis in a measure as *substitute* for the omitted specific action of sexual excitement. As a further cor—

gestion, etc. In the corresponding attack of anxiety of our neurosis, we have before us the dyspnoea, the palpitation, etc., of the coitus in an isolated and aggravated manner.

It can still be asked why the nervous system merges into a peculiar affective state of anxiety under the circumstances of psychic inadequacy for the subjugation of the sexual excitement. A hint to the answer is as follows: The psyche merges into the affect of anxiety when it perceives itself unfit to adjust an externally approaching task (danger) by a corresponding reaction; it merges into the neurosis of anxiety when it finds itself unable to equalize the en

fact that the anxiety underlying the manifestations of the neurosis is not of psychic derivation Such for example would exist if we found as a basis for the anxiety neurosis a justified fright happening once or repeatedly which has since supplied the source of the preparedness for the *anxiety neurosis* But *this is not* the case a former fright can perhaps cause an hysteria or a traumatic neurosis but never an anxiety neurosis As the *coitus interruptus* is rendered so prominent among the causes of anxiety neurosis I have thought at first that the source of the continuous anxiety was perhaps the repeated fear during the sexual act lest the technique will fail and conception follow But I have found that this *state of mind* of the man or woman during the *coitus interruptus plays no part in the origin of anxiety* neurosis that the women who are really indifferent to the possibilities of conception are just as exposed to the neurosis as those who are trembling at the possibility of it it all depends on which person suffers the loss of sexual gratification

Another starting point presents itself in the as yet unmentioned observation that in a whole *series of cases the anxiety neurosis goes along* with the most distinct diminution of the sexual *libido* or the psychic desire *o that* on revealing to the patients that their affliction depends on *insufficient gratification* they regularly reply that this is impossible as just now their whole desire is extinguished The indications that we deal with an accumulation of excitement that the anxiety which probably corresponds to such accumulated excitement is of somatic ori in so that somatic excitement becomes accumulated and furthermore that this somatic excitement is of a sexual nature and *that it is accompanied by a decreased psychic* participation in the sexual processes—all these *indications I say favour the expectation that* the mechanism of the anxiety neurosis is to be found in the deviation of the somatic sexual excitement from the psychic and in the abnormal utilization of this excitement

This conception of the mechanism of anxiety neurosis will become clearer if one accepts the following view concerning the sexual process in man In the sexually mature male organism the somatic sexual excitement is—probably continuously—produced and this becomes a *periodic* stimulus for the psychic life To make our conceptions clearer we will add that this somatic sexual *excitement* manifests itself as a pressure on the wall of the seminal vesicle which is provided with nerve endings This visceral excitement thus becomes continuously increased but not before attaining a certain height is it able to overcome the resistances of the intercalated conduction *as far as the cortex* and manifest itself as psychic excitement Then *the group of sexual ideas existing in the psyche* becomes endowed with energy and results in a psychic state of libidinal tension which is accompanied by an impulse to remove this tension Such psychic unburdening is possible only in one way which I wish to designate as specific or adequate action This adequate action for the male sexual impulse consists of a complicated spinal reflex act which results in the un*burdening of those nerve endings and of* all psychically formed preparations for the liberation of this reflex Anything else except the adequate action would be of no avail for after the somatic sexual excitement has once reached the liminal value it continuously changes into

—

matic excitement existing at the time and allow the subcortical conduction to reestablish its re*sistance*

I will desist from presenting in a similar manner more complicated cases of the *sexual* process I will merely formulate the statement that this scheme can essentially be transferred to the woman despite the problem of the perplexity artificial retardation and stunting of the female sexual impulse In the woman too it can be assumed that there is a somatic sexual excitement and a state in which this excitement becomes psychic evoking libido and the impul e to pecific action accompanied by the sensual feeling But we are unable to state what *analogy there may be in the woman* to the unburdening of the seminal vesicles

*We can bring into the bounds of this repre*sentation of the sexual process the aetiology of *actual* neurasthenia *as well as of anxiety neu*rosis Neurasthenia always originates whenever the adequate (action) unburdening is *replaced* by a less adequate one like the normal coitus under the most favourable conditions by a masturbation or spontaneous pollution while anxiety neurosis is produced by all factors which impede the psychic elaboration of the somatic sexual excitement The manifestations of anxiety neurosis are brought about by the fact that the somatic sexual excitement diverted from the psyche expends itself subcortically in not at all adequate reactions

of others or receiving i format on concerning sexual processes.

In my first communication on the defence neuro-psychoses I failed to explain how the ex ert on of a hitherto healthy indi idual to forg t such traum tic happenings would re ult in the real intentional repression, and thus pen the door for the defence neurosis It can not de pend on the nature of the experience as other persons remain unaffe ted desp te the same mo tives Hysteria cannot the efore be fully ex plained by th effect of th trauma and we are fo ced to dm t that the capacity for hys teria already ex ted before the trauma.

This i d finite hysterical pred spos t on can ow wholly or partı lly be substit ted by the posthum s effe t of the infantil sexual t au ma. The epr ssio of the memory of a pain ful xual experience f mat rer years can take place nly in pers ns in whom this experience can bring into activity the memory emnants of a infantile trauma.

proportionately greater frequency of hysteria in the female sex as even in childhood this sex is more subject to sexual assaults

The objection most frequently advanced against this result may be to the purport that sexual assaults on little children occur too frequently to give an aetiological value to its verification or that such experiences must remain ineffectual just because they concern a sexually undeveloped being and that one must moreover be careful not to obtrude upon the patient through the examination such alleged reminiscences or believe in the romances which they themselves fabricate To the latter objections I hold out the request that no one should really jud e with great certainty this obscure realm unless he has made use of the only method which can clear it up (the method of psycho analysis for bringing to consciousness the hitherto unconscious) The essential point in the first *doubts is settled by the observation that* it really is not the experiences themselves that act traumatically but their revival as reminiscences after the individual has entered into sexual maturity

My thirteen cases of hysteria were throughout of the graver kind they were all of long duration and some had undergone a lengthy *and unsuccessful hospital treatment Every one* of the infantile traumas which the analysis revealed for their severe cases had to be designated as severe sexual injuries some of them were indeed abominable Among the persons who were guilty of such serious abuse we have in the first place nurses governesses and other servants to whom children are left much too carelessly then in regrettable frequency come the teachers but in seven of the thirteen cases we dealt with innocent childish offenders mostly brothers who for years entertained sexual relations with their younger sisters The course of events always resembled some of the cases which could with certainty be tracked namely that the boy had been abused by a person of the feminine sex thus awakening in him prematurely the libido and that after a few years he repeated in sexual aggression on his sister the same procedures to which he himself was subjected

I must exclude active masturbation from the list of sexual injuries of early childhood as being pathogenic for hysteria That it is so very frequently found associated with hysteria is due to the fact that masturbation in itself is more frequently the result of abuse or seduction than one supposes It not seldom happens that both members of a childish pair later in life become afflicted by a defence neurosis the brother by obsessions and the sister by hysteria which naturally gives the appearance of a familial neurotic predisposition This pseudo heredity is now and then solved in a surprising manner I have had under observation a brother sister and a somewhat older cousin The analysis which I have undertaken with the brother showed me that he suffered from reproaches for being the cause of his sister s malady he himself was corrupted by hi cousin concerning whom it was known in the family that he fell a victim to his nurse

I can not definitely state up to what age sexual damage occurs in the aetiology of hysteria but I doubt whether sexual passivity can cause repression after the eighth and tenth year unless qualified for it by previous experiences The lower limit reaches as far as memory in general that is to the delicate age of one and one half or two years (two cases)[1] In a number of my cases the sexual trauma (or the num*ber of traumas) occurred during* the third and fourth year of life I myself would not len l credence to this peculiar discovery if it were not for the fact that the later development of the neurosis furnished it with full trustworthiness In every case there are a number of morbid symptoms habits and phobias which are only explainable by returning to those youthful experiences and the logical structure of the neurotic manifestation makes it impossible to reject the faithfully retained memories of childhood Except through psycho analysis it is of no avail to ask a hysterical patient about these infantile traumas their remnants can only be found in the morbid symptoms and not in conscious memory

All the experiences and excitements which prepare the way for or occasion the outbur t of hysteria in the period of *life* after puberty evidently act through the fact that they awaken the memory remnants of those infantile traumas which do not become conscious but lead to the liberation of affect and repression It is quite in harmony with this rôle of the later traumas not to be subject to the strict limitation of the infantile traumas but that both *in intensity* and quality *they can vary from* an actual exual assault to a mere approximation of the sexual such as perceiving the sexual acts

II *The Essence and Mech nism of Compulsion Ne rosis*

Sexual experiences of early childhood have the sam significance in the aetiology of the compuls on neuros s as in hysteria still we no longer deal here w th exual passivity but with pleasurably accomplished aggres io s and with pleasurably experie ced participatio in sexual acts that s we deal he e w th sexual activ ity It s due to this d ffere ce in the aet olog cal relation that the masculine sex seems to be preferred in the compul on neuro s

In all my cases of compuls on neuros s I ha e f und bes des *a sub s l of hysterical symp t ms* which could be traced to a plea urable ac t on f exual pass vity fr m a precedent scene I presume that this coi c dence s a l wful one and that premature sexual aggressio always pres ppo es an experience of seductio But I am unable to pr se t as yet a complete description of the aeti logy of the compul on n u o-s s I o ly believe that the final determination as to whethe a hysteria or compuls on neuro is hould originate on the ba s of infantile trau mas d pe ds on the t mporal relatio of the de elopme t of the l b do

The e ence of the compuls on neurosis may be expres ed in the foll wi g simple formula *Obs o s are always t ansformed* rep oaches *et rn ng f om the epre sio wh ch alw ys efer to pl asurably accompl shed sexu al ac t on of childhood* I order to elucidate this sent ce t will be nec ss ry to de cribe the typ cal course f c mpulsio e i

In a first peri d—period of childish unmo-

These theo es f pas i d t sexual tra mas have later bee gi en up by the th —Tr.

rality—the events containing the seeds of the later neurosis take place In the earliest childhood there appear at first the experiences of sexual seduction which later makes the repression possible and this is followed by the actions of sexual aggressions against the other sex which later manifest themselves as actions of reproach

This period is brought to an end by the appearance of the—often self ripened—sexual maturity A reproach then attaches itself to the memory of that pleasurable action and the connection with the initial experience of passivity makes it possible—often only after conscious and recollected effort—to repress it and replace it by a *primary symptom of defence* The third period that of apparent healthiness but really of *successful defence* begins with the symptoms of scrupulousness shame and diffidence

The next period of the disease is characterized by *the return of the repressed reminiscences* hence by the failure of the defence But it remains undecided whether the awakening of it is more frequently accidental and spontaneous or whether it appears in consequence of actual sexual disturbances that is as additional influences of the same But the revived reminiscences and the reproaches formed from them never enter into consciousness unchanged What becomes conscious as an obsession and obsessive affect and substitutes the pathogenic memory in the conscious life are compromise formations between the repressed and the repressing ideas

In order to describe clearly and probably convincingly the processes of repression the return of the repression and the formation of the pathological ideas of compromise we would have to decide upon very definite hypotheses concerning the substratum of the psychic occurrence and consciousness As long as we wish to avoid it we will have to rest content with the following rather figuratively understood observations Depending on whether the memory content of the reproachful action alone forces an entrance into consciousness or whether it takes with it the accompanying reproachful affect we have two forms of compulsion neurosis The first represents the typical obsessions the content of which attracts the patient s attention only an indefinite displeasure is perceived as an affect whereas for the content of the obsession the only suitable affect would be one of reproach The content of the obsession is doubly distorted when compared to the content of the infantile compulsive act First something actual replaces the past experience and second the sexual is substituted by an analogous non sexual experience These two changes are the results of the constant tendency to repression still in force which we will attribute to the *ego* The influence of the revived pathogenic memory is shown by the fact that the content of the obsession is still partially identical with the repressed or can be traced to it by a correct stream of thought If with the help of the psycho analytic method we reconstruct the origin of one individual obsession we find that one actual impression instigated two diverse streams of thought and that the one which passed over the repressed memory though incapable of consciousness and correction proves to be just as correctly formed logically as the other If the results of the two psychic operations disagree the contradiction between the two may never be brought to logical adjustment but as a compromise between the resistance and the pathological result of thought an apparently absurd obsession enters into consciousness beside the normal result of the thought If both streams of thought yield the same result they reinforce each other so that the normally gained result of thought now behaves psychically like an obsession *Wherever neurotic compulsion manifests itself psychically it originates from repression* The obsessions have as it were a psychical course of compulsion which is due not to their own validity but to the source from which they originate or to the source which furnishes a part of their validity

A second form of compulsion neurosis results if the repressed reproach and not the repressed content of memory forces a replacement in the conscious psychic life Through a psychic admixture the affect of the reproach can change itself into any other affect of displeasure and if this occurs there is nothing to hinder the substituting affect from becoming conscious Thus the *reproach* (of having performed in childhood some sexual actions) may be easily transformed into *shame* (if some one else becomes aware of it) into *hypochondriacal anxiety* (because of the physical harmful consequences of those reproachful acts) into *social anxiety* (fearing punishment from others)

one s own moral ability of resistance) etc Besides the memory content of the reproachful action may also be represented in conscious

ress or it may be altogether o cealed, which makes the diagno is ery difficult. Many cases which on superficial examination re taken as ordinary (neurasthenic) h pochondria often belong t this group of *compulsive affects* the very frequently so-called *periodic neurasthenia* or *periodic m lanchol a* especially se m to be explained by c mpul ve affects or obse ions a recognition not unimportant therapeutically

Beside these c mpr mise ympt ms which signify the return of the rep ess and hence a failure of the on inally achieved defence the compulsion neur is forms a series of ther symptoms of a t tally different origin The ego f on t those de

measur s which have perf rmed good service in the struggl carried on against the bsess ons and the bses in affects If these helps in the conflict of the defence really s cceed in repress ing anew the symptoms of return obtruding themsel es on th ego the compulsion then transmits itself on the protect e measures themsel es and p oduces a third form of the *compulsion neurosis* th *compulsive act on*. These are neve primary they never co tain anything else but a d fenc nev r an aggres sion Psycho-analysis hows that, despite their peculiarity they can always be fully explained by reduction to the compuls ve reminiscence which they oppose

One sample ins ead f ma y An leven year-old boy has obsessively rranged f himself the following ceremonial bef re oi g to bed He could ot f ll sleep les he related his m the mos minu ly

lyin on him sleep ng the side—because d ring

The secondary defence of the obsessions can be brought about by a forc ble deviation to other thou hts of pos ibly contrary content hence in case of succe s there is a *compulsive reasoni g* regularly concerning ab tract and *transcendental* subject because the repressed ideas always occupied themsel es with sen u ous ess Or the patient tries to become master of every compulsive idea through logical la bour and by appealing to his conscious mem ory this leads to *compuls ve think ng a d ex am ation* and to *doubti g mania* The priority of the perception before the memory in these examinations at first induces and then forces

in a gr ater number of defensi e measu s which are capable of being transformed into compulsive actions These can be grouped ac cord to their tendency We may ha e *meas ures of pen te ce* (ksome ceremonial and ob- servat on of umbers) of *p event on* (di erse

sc o is (dipsomania) Amo g these compulsi e acts and impulses the phobias play the greatest part as limitations of the patient s existence

There are cases in which we can observe how the compuls on becomes transferred from the id a o aff ct to the measure, and other cases in which th compulsi n oscillates between the returning symptoms of ec ndary defence. But there are also cases in which o obsessions are really formed but the repressed reminiscence immediately becomes replaced by the apparent primary defensive measure. Here that stage is attained at a bound which oth rwise ends the c urse of the compuls on neu osis only after the conflict of the defe ce. Grave cases of this affection end e ther with a fixat n f ceremo- nial actions gen ral doubting mania o in an existence of eccentricity c ditu ed by phobias

That the b ess ns and everything derived fr m them are n t believed is probably due to the f ct that the defence sympt m of *scrupu lousne* was f rmed during the first repression and gained compulsive validity The certainty of ha ing li ed morally th oughout th whole period of the su cessful defe ce makes t im poss'ble to gi e crede c to the reproach which the bsession really in olves. Only trans torily

reproach which h had to bear from his mothe up to

during the appearance of a new obsession and now and then in melancholic exhaustive states of the ego do the morbid symptoms of the re turn also enforce the belief The *compulsion* of the psychic formations here described has in general nothing to do with the recognition *through belief and is not to be mistaken for* that factor which is designated as *strength* or *intensity* of an idea Its main characteristic lies in its inexplicableness through psychic ac tivities of conscious ability and this character *undergoes to change* whether the idea to which the compulsion is attached is stronger or weak er more or less intensively *elucidated supplied with energy* etc

The reason for the unassailableness of the obsession or its derivative is due only to its connection with the repressed memory of early childhood for as soon as we succeed in making it conscious for which the psycho therapeutic methods already seem quite sufficient the com pulsion too becomes detached

III *Analysis of a Case of Chronic Paranoia*

For some length of time I *entertained* the idea that paranoia also—or the group of cases belonging to paranoia—is a defence psychosis that is like hysteria and obsessions it originates from the repression of painful reminiscences *and that the form of its symptoms is deter* mined by the content of the repression A spe cial way or mechanism of repression must be peculiar to paranoia perhaps just as in hys

[illegible] by way

s

accomplished (displacement along certain as sociative categories) I observed many cases which seemed to favour this interpretation but I had *not found any which demonstrated it un* til a few months ago when through the kindness of Dr J Breuer I subjected to psycho analy sis with therapeutic aims an intelligent woman of 32 whom no one will be able to refuse to designate as a chronic paranoiac. I report here some explanations gained in this work because I have no prospects of *studying* paranoia ex cept in very isolated examples and because I think it possible that these observations may instigate a psychiatrist for whom conditions are more favourable to give due justice to the ele ment of defence *in the present animated dis* cussion on the nature and psychic mechanism of paranoia It is of course far from my thoughts to wish to show from the following single observation anything but that this case is a defence psychosis and that in the group *of paranoia* there may be still others of a sim ilar nature

Mrs P thirty two years old married three years She is the mother of a two year-old child and does not de cend from nervous par ents but her si ter and brother whom I know are also neurotic It was doubtful whether he was not transitorily depressed and mistaken in her judgment *in the middle of her twentieth* year During the last years she was healthy and capacitated until she evinced the fir t symptoms of the present illness six months after the birth of her child She became se *cluded and suspicious showing* a disinclination towards social relations with the relatives of her husband and complained that the neigh bours in the little town now behaved towards her in a rather impolite and regardless man ner *Gradually these complaints grew in inten* sity she thought that there was something against her though she had no notion what it could be But there was no doubt that all the relatives and friends denied her respect and *did everything to aggravate her* She was try ing very hard to find out whence this came but could not discover anything Some time later she complained that she was watched that her thou hts were guessed and that every *thing that happened in her house* was known One afternoon she suddenly conceived the thought that she was watched during the eve ning while undressing After that she applied while undressing the most complicated precau *tionary measures She slipped into* her bed in the darkness and undressed only under cover As she avoided all social relations and took but little nourishment and was very depres ed she was sent in the summer of 1895 to a hydro- *therapeutic institute* There new symptoms ap peared and reinforced those already existing As early as the spring *while she was alone* with the servant girl she suddenly perceived a sensation in her lap and thought that the servant girl then had an unseemly thought This sensation became more frequent in the *summer it was almost continuous* and she felt her genitals as if one feels a heavy hand She then began to see pictures which fright ened her they were hallucinations of female nakedness especially an exposed woman s lap with hair occasionally she also saw male gen itals The picture of the hairy lap and the *organic sensation in the lap usually came con* jointly The pictures became very a ravating as she regularly perceived them when she was

in the company of a woman and the thou ht ac ompanying them was that she ees the woma in an indece t expo ure and that in the sam moment the w man sees the same p cture f her Simultaneously with these visual hallu cinations which, after the r first appearance in the hospital disappeared again for many months he began to be troubled w th ces which he did ot recognize and could n t ex plain. Wh n she was in the street he heard, "This s Mrs P—H r sh goes—Where does she g E ry one of her mo ements and ac tions were comme ted upon. Occasionally she heard threats and reproaches All these symptoms became worse wh n he wa in society or even in the street h th ref re hesitated about going ut she also stated that she ex perienced ausea t the th ught of food and as a result he became reduced in tality

I btained all this from her wh n he came und r my care in the winter of 189 I have presented the d tails of thi case in rder to give the impress on that we really deal here with a ery common f rm f chronic paranoia, the di gno is of which will agree w th the de tails of the symptoms and the patient s be ha our to be described later At that time sh ither concealed from me the delus ns for th interpretatio of the hallucinat ons o they

bout her hall cinations and towa d the end sh d d not say m ch bout the aggra ati ns and persecutions f om which sh uffe ed.

What I hall report about this patient con cerns the eti logy f the case and the mecha ni m of the hall cinat ons I discove d the etiology by applying Breu method exa tly as in hysteri f the investigat and re

oth rs by er ming certain res tan The patient immediat ly c rroborated this expect tion by beha ing d ring the analy exa tly like h steric, d und attentio t th p es sure f my hand he reprod ced th hts which s c ld t rem mbe ha ing had whi h she t first could t und rstand and whi h con tradicted her expectations The occurrence of mportant unconscious ideas was therefore also demonstrated in a ca e of para o a and I could hope to reconduct the compulsion of paranoia t repress on. It was only peculiar that the assertions which originated in the un conscious were usually heard inwardly or hallucinated by her as her voices.

Con erning the origin of the visual hallucina tions or at least the id p ctures I discov e ed the following The p cture of the female lap occurred almost always together with the organic sensation in the lap The latter however was mo e constant and often occurred without the p cture.

The first p ctures of feminine laps appeared in the hydro-therapeutic institute a few hours after she had ctually een a number of women naked in the bath hou e. They were there f re only simple reproductions of a real impres s n It may be assumed that these impress ons repe ted thems l es because something of great interest was connected with th m. She stated that he was at that t me ashamed of these women and that since she r called it she is a hamed of ha ing been seen naked. Ha ing been obliged to look upon this shame as some thing compulsive I concluded that according to the mechanism of defence an experien e must ha e here been rep essed in which he was n t ashamed and I requested her t allow those eminisc ces t emerge which belonged to the theme of sham She promptly rep oduced a series of scenes from h s venth to h r e hth year during which while bathing before her mother her s ter and her phys cian she was a hamed of her nakedness This series howeve reach d back to a scene her sixth year when sh dressed in the children s o m before going to sleep without feeling ashamed of her b other who was prese t. On questi n ing her t was found that th re were a numbe f such scenes and that f years the broth rs and ist rs we in the hab t of howing them sel es naked to ne an ther before retiring I ow understood the s gnificance f the sudden th ght f being watched on g ing to leep It was n unchanged fragment of the old re proa hful r miniscence and she was now try g to m k up in sham what he lost as a child

Th supposition that we d alt h with an *mour* of childhood so frequent in the a t o- logy f hysteria was strengthened by th fur ther progres f the analysis which also showed simultaneous s l t ns fo indi dual freque t

ly recurring details in the picture of paranoia The beginning of her depression commenced at the time of a disagreement between her hus band and her brother on account of which the latter no longer visited her She was always *much attached to this brother* and missed him very much at this time Besides this she spoke about an experience in the history of her dis ease during which for the first time every thing became clear that is during which she became convinced that her assumption about being generally despised and intentionally an noyed was true She gained this assurance dur ing a visit of her sister in law who in the course of conversation dropped the words If *such* a thing should happen to me I would not mind it Mrs P at first took this utterance unsus pectingly but when her visitor left her it seemed to her that these words contained a reproach meaning that she was in the habit of taking serious matters lightly and since that *hour* she was *sure* that she was *a victim* of common slander On asking her why she felt justified in referring tho e words to herself she answered that the tone in which her sister in law spoke convinced her of it—to be sure subsequently (This is really a characteristic detail of paranoia) I now urged her to recall *her sister in law s conversation before the ac* cusing utterance and it was found that she re lated that in her father s home there were all sorts of difficulties with the brothers and added the wise remark In every family many things happen which one would rather keep under cover and that if such a thing should happen to her she would take *it lightly* Mrs P had to acknowledge that her depression was connected with the sentences before the last utterance As she repressed both sentences which could recall her relations with her bro ther and retained only the last meaningless one she was forced to connect with it the feeling *of being reproached by her sister in law* but inasmuch as the contents of this sentence of fered absolutely no basis for such assumption she disregarded it and laid stress on the tone with which the words were pronounced It is probably a typical illustration of the fact that the misinterpretations of paranoia depend on *repression*

In a surprising manner it also explains her peculiar behaviour in making appointments with her brother and then refusing to tell him anything Her explanation was that she thought that if she only looked at him he must under stand her suffering as he knew the cause of it As this brother was really the only person who could know anything about the aetiology of her disease it followed that she acted from a mo tive which though she did not consciously understand seemed perfectly justified as soon as a new sen e was put on it from the uncon scious

I then *succeeded in causing her to reproduce* different scenes the culminating points of which were the sexual relations with her brother at least from her sixth to her tenth year During this work of reproduction the organic sensa tion in the lap joined in the discussion pre cisely as regularly observed in the analysis of *memory remnants of hysterical patients* The picture of a naked female lap (but now reduced to childish proportions and without hair) im mediately appeared or stayed away in accord ance with the occurrence of the scene in question in full light or in darkness The disgust for eating too was explained by a repulsive detail of these actions After we had gone through this series the hallucinatory sensations and picture disappeared without having thus far returned

I have thus learned that these hallucinations were nothing other than fragments from the content of the repressed experiences of child hood that is symptoms of the return of the repressed material

I now turned to the analysis of the voices Here it must before all be explained why such different remarks as Here goes Mrs P—She now looks for apartments etc could be o painfully perceived and how these harmless sentences managed to become distinguished by hallucinatory enforcement To begin with it was clear that these voices could not be hal lucinatory reproduced reminiscences like the pictures and sensations but rather thoughts which became loud

She heard the voices for the first time under *the following circumstances* With great tension she read the pretty story *The Heiterethei* by O Ludwig and noticed that while reading she was preoccupied with obtruding thoughts Im mediately after she took a walk on the high way and suddenly while passing a peasant s cottage the voices told her 'That is how the house of the Heiterethei looked! Here is the well and here is the bush! How happy she was in all her poverty! The voices then repeated

Wh th m g e cces of th t tm t was lat r m ed by cerb t sh d d t ga see th ff p t re f st g g ital b t he had the d th t st g rs w h gen tal as soo s th y w re beh d h

hole paragraphs of what she had just read ... it remained incomprehensible why house ... ish, and well of the H terether, and just such ... edifferent and most irrelevant passages of th ... romance should have obtruded themselves upon her attention with pathognomical strength. The analysis showed that while reading she at the same time entertained extraneous thoughts and that she was excited by totally different passages of the book. Against this material analogy between the couple of the romance and herself and her husband the reminiscence f ... intimate things of her married life and family secrets—against all these there arose a repressive resistance because they were connected with her sexual shyness by very simple and demonstrable treams of thoug t, and finally resulted in the awakening f old experiences f childhood. In consequence f the censor ship exercised by the repression, the harmless and idyllic passages connected with the objectionable ones by contrast and vicinity became reinforced in consciousness enabling them to become udible F r example the first repressed thought referred to the ... der to which the secluded heroine was subjected by her neighbours. Sh readily found in this an analogy to herself She too lived in small place had no interco rse with anybody and considered herself despised by her neighbours The suspicion against the neig bours was founded on the f ct that in the beginning of her married lif sh was bliged t content herself with a small partment. The wall of the bedroom, ear which stood th nuptial bed of the young ouple adj ...ed the neighbour s room. W h the beginn... of her marriage there awakened in her great sexual hyness. This was apparently due to an unconscious awakening of some reminiscences of childhood ... She was

against the neighbours.

The voices therefore owed their origin to the repression of thought which in the last analysis really ...ed reproaches on the occasion of an experience analogous to the infantile trauma they were ac rdingly symptoms f the return f the repression, but t the same time they were results f a compromise between the resistance f the ego and the f rce f the returning repression which in this case produced distortion beyond recognition. On othe occasions when analyz... voices in Mrs. P the distortion was less marked, still the words heard always showed a character of diplomatic uncertainty The annoying allusion was generally deeply hidden, the connection of the individual sentences was masked by a strange expression, unusual forms of speech, etc., characteristics generally common to the auditory hallucinations of paranoiacs, and in which I noticed the remnant of the compromise distortion. The expression, "There goes Mrs P she is looking for apartments in the street, signified, for example the threat that he will never recover for I promised her that after the treatment he would be able to return to the Little city where her husband was employed. She rented temporary quarters in Vienna for a few months.

On some occasions Mrs. P also perceived more distinct threats for example, concerning the relatives of her husband, the restrained expression of which still continued to contrast with the grief which such voices caused her Considering all that we otherwise know of paranoiacs I am inclined to assume a gradual relaxation of that resistance which weakens the reproaches, so that finally the defence fails completely and the original reproach the insulting word, which one wished to save himself returns in unchanged form I do not however know whether this is a constant course whether the censo of the express ons of reproach can not from the beginning stay away or persist t the end.

The only thing left is to utilize the explanations gained in this case of paranoia for a comparison of paranoia with compulsion neurosis Here as there the repress on was hown to be th n cleus of the psychic mechanism, and in both cases the repress on is a sexual experience of childhood. Th origin of every compulsion in this paranoia is in the repression and the symptoms of paran ia all w a similar classification as the one found justified in compulsion neurosis. Some symptoms also originate from the primary defence among which are all delusions of distrust susp cion, and persecution by others. In compuls on neurosis the initial reproach became repressed through the formation of the primary symptom of defence s lf distrust Moreover the reproach was recognized as justified, and for the purpose of adjustment, the validity acquired by the scrupulousness during the normal interval now guards against giving credence to the returning reproach in th form f n obsession. By the formation f the defence-symptom of *distrust in others* the

reproach in paranoia is repressed in a way which may be designated as *projection* the reproach is also deprived of recognition and as a retaliation there is no protection against the returning reproaches contained in the delusions

The other symptoms in my case of paranoia are therefore to be designated as symptoms of the return of the repression and as in the compulsion neurosis they show the traces of the compromise which alone permits an entrance into consciousness Such are the delusions of being observed while undressing the visual hallucination the perceptual hallucinations and the hearing of voices The memory content existing in the delusion mentioned is almost unchanged and appears only uncertain through utterance The return of the repression into visual pictures comes nearer to the character of hysteria than to the character of compulsion neurosis still hysteria is wont to repeat its memory symbols without modification whereas the paranoiac memory hallucination undergoes a distortion similar to that in compulsion neurosis An analogous modern picture takes the place of the one repressed (instead of a child s lap it was the lap of a woman upon which the hair were particularly distinct because they were absent in the original impression) Quite peculiar to paranoia but no further elucidated in this comparison is the fact that the repressed reproaches return as loud thoughts this must yield to a double distortion (1) a censor which either leads to a replacement through other associated thoughts or to a concealment by indefinite expressions and (2) the reference to modern which is merely analogous to the old thou hts

The third group of symptoms found in compulsion neurosis the symptoms of the secondary defence cannot exist as such in paranoia for no defence asserts itself against the returning systems which really find credence As a substitute for this we find in paranoia another source of symptom formation the delusions (symptom of return) reaching consciou ness through the compromise make great demands on the mental work of the ego before they can be unconditionally accepted As they themselves are not to be influenced the ego must adapt itself to them and hence the combining delusional formation the *delusion of interpretation* which results in the *transformation of the ego* corre ponds here to the symptoms of secondary defence of compulsion neurosis In this respect my case was imperfect as it did not at that time show any attempt at interpretation this only appeared later I do not doubt, however that if psycho analysis were also applied to that stage of paranoia another important result would be established It would probably be found that even the so-called *weakness of memory* in paranoiacs is tendentious that is it depends on the repression and serves its purpose Subsequently even those non patho enic memories which stand in opposition to the transformation of the ego become repressed and replaced this the symptoms of return imperatively demand.

CHAPTER 8
ON PSYCHO THERAPY

GENTLEMEN It is almost eight years since at the request of your deceased chairman Professor von Reder I had the pleasure of speaking in your midst on the subject of hysteria Shortly before (1895) I had published the *Studies in Hysteria* together with Dr J Breuer and, on the basis of a new knowledge for which we are thankful to this investigator I have attempted to introduce a new way of treating the neuroses Fortunately I can say that the endeavours of our *Studies* have met with succe that the ideas which they advance concerning the effects of psychic traumas through the restraining of affects as well as the concept of the hysterical symptoms as a displacement of excitement from the psychic to the physical—ideas for which we have coined the terms *ab reaction* and *conversion* are today generally known and understood In German speaking countries one cannot find any descriptions of hysteria in which these facts are not more or less recognized There is no psychiatrist who does not now at least take some note of these theories And yet as long as they were new these theories and these terms must have sounded strange enough

I can not however say the same about the therapeutic procedure which we have propo ed together with our theory It still struggles for recognition This may have its special reasons. The technique of the procedure was at that time still rudimentary I was unable to give those indications to the medical reader of our book which would enable him to accomplish this treatment But there were surely other causes of a general nature To many physicians psy cho therapy even today appears as a product of modern mysticism In comparison to our

Lect re d l red bef th Vienna Coll ge f Phys ci o Decembe 19 4

phys.co-c.emical remedies the application of w.ich is based on ph s ological in.ght psycho-t.erapy appears quite un cientific and unworthy f the interest of a true cient st You will, t.erefore all w me to peak to you on the subject of psycho-therapy in order to point out what part of t.is erdict can be des gnated as unjust or erroneous.

In the first place let me remind you that psycho-therapy is not a modern therapeutic procedure. On the contrary t s o e of the

s
i
d
it
ct
o-

therapy f only because an ther ery impor tant party in the treatment—namely the pa tient—has n intent on of aband ning t You know how much we owe t the N cy school (Li'bault Bernheim) fo thes explanations W th ut our intention an indepe dent f ctor from th patient s psychic dispos ti n ent rs into the cti ty f every remedial agent in troduced by phys cians which though mostly fa ourable ften also a ts nhib tingly We ha e learned t apply to thi f cto the word *sg stion* and Moeb us taught us that the f l res of some of our remedies are t be as cribed t the disturbing infl ences of this ery powerful facto You doct rs ll of you constantly pract se psycho-th rapy even when ou do not know it do not intend it, but with one disadvantage—you l e e tirely to the pati nt th psychic f tors of your influ en It then be omes un o trollable t can not be di ded into doses and hence can not be increased. Is t t justifiable on the part f the doctor to master this fact to make in tentional use f t to direct and *enforce* t? It is othing but that, that scientifi psycho-th rapy expects f you.

In the third pla gentlemen I wi.h to call your ttention to well known f ct, nam ly that certai maladies and part cularly th psy ho-neuroses, are more cess bl t psy hic in.uences than t any ther remedies It is no modern talk, but a dictum of old physicians that these diseases are not cured by the drug but b the doctor—to wit by the personal ity of the physician in so far as he exerts a psychic influence I am well aware gentlemen that you are impressed with the idea which the esthete Vi.cher in his parody on *Faust (Faust der Tragod e III Teil)* endowed with this cla. cal express on "I know that the psy chical often acts on the moral.

But would it not be more adequate and frequently more correct to influence the moral part of the person with the moral that is with psychic means?

There are many ways and means of psycho-therapy All methods are good which produce the aim of the therapy Our usual consolation "You will soon be well again" with which we are so generous to our patients corresponds *to one of these psycho-therapeutic methods* only that on gaining a profounde insight into th neuroses we are not fo ced to limit our selves to this consolation alone We ha e de-veloped the technique of hypnot c suggestio of psycho-therapy through di ers on through practice and through the evocation of serv ce able affects I do not disdain any of them and would practise them all und r suitable con dit ons That I have *in reality restricted* my self t a in le therapeutic procedure to the method called by Breuer *cathart c* which I prefe to call *a alyt c* is s mply due to subjec

penetratingly and carries farthest through t one can produce the most prolific changes in the patient. If I relinqui.h for a mo ment the *therapeutic point of view* I can as sert that t is the most interesting and that it l e teaches us omething co c rning th

ences

Allow me now to correct me errors and furnish some explanat ns concerning th s cath artic or analytic method of psycho-therapy

(a) I notice that this method is often mis taken for the hypn tic ugge tive tre tment. I n t ce this by th f ct that quite f equently colleague whose confidant I am not by any

means send patients to me refractory patients of course with the request that I should hypnotize them Now for eight years I have not practised hypnotism (individual cases excepted) as a therapeutic aim and hence I return the patients with the advice that he who relies on hypnosis should do it himself In truth the greatest possible contrast exists between the suggestive and the analytic techniques that contrast which the great Leonardo da Vinci has expressed for the arts in the formulae *per via di porre* and *per via di levare* Said Leonardo the art of painting works *per via di porre* that is to say by placing little heaps of paint where they have not been before on the uncoloured canvas sculpturing on the other hand works *per via di levare* that is to say it takes away from the stone as much as covers the surface of the statute therein contained Quite similarly gentlemen the suggestive technique acts *per via di porre* it does not concern itself about the origin force and significance of the morbid symptoms but puts on something to wit the suggestion which it expects will be strong enough to prevent the pathogenic idea from expression On the other hand the analytic therapy does not wish to put on anything or introduce anything new but to take away and extract and for this purpose it concerns itself with the genesis of the morbid symptoms and the psychic connection of the pathogenic idea the removal of which is its aim This manner of investigation has considerably furthered our understanding I have so early given up the technique of suggestion and with it hypno is because I despaired of making the sug estion as strong and persistent as would be necessary for a lasting cure In all grave cases I noticed that the suggestions which were put on crumbled off again and then the disease on replacing it reappeared Besides I charge this technique with concealing from us the psychic play of forces It does not permit us to recognize the resistance with which the patients adhere to their malady with which they also strive against recovery and which alone can give us an understanding of their behaviour in life

(b) It seems to me that a very widespread mistake among my colleagues is the idea that one has yet asked me how I do it There can only be one reason for it they believe there is nothing to ask that it is a matter of course. I occasionally also hear with surprise that in this or that division of a hospital a young interne is requested by his chief to undertake a *psycho analysis* with a hysterical woman. I am convinced that he would not entrust him with the examination of an extirpated tumor without previously assuring himself that he is acquainted with histological technique Likewise I am informed that this or that colleague has made appointments with a patient for psychic treatment whereas I am certain that he does not know the technique of such a treatment He must therefore expect that the patient will bring him her secrets or he seeks salvation in some kind of a confession or confidence I should not wonder if the patient thus treated would be harmed rather than benefited. The mental instrument is really not at all easy to play On such occasions I can not help but think of the speech of a world renowned neurotic who really never came under a doctor's treatment and only lived in the fancy of the poet I mean Prince Hamlet of Denmark The king has sent the two courtiers Rosencrantz and Guildenstern to investigate him and rob him of his secret While he defended himself pipes were brought on the stage Hamlet took a pipe and requested one of his tormentors to play on it saying that it is as easy to play as to lie The courtier hesitated because he knew no touch of it and as he could not be moved to attempt to play the pipe Hamlet finally burst forth Why look you now how unworthy a thing you make of me! You would play upon me you would seem to know my stops you would pluck out the heart of my mystery you would sound me from my lowest note to the top of my compass and there is much music excellent voice in this little organ yet you can not make it speak Sblood! do you think I am easier to be played on than a pipe? Call me what instrument you will though you can fret me you cannot play upon me

(c) You will have surmised from some of my observations that the analytic cure contains qualities which are far from an ideal therapy *Tuto cito incunde* the investigation and examination do not really mean rapidity of success and the allusion to the resistance has prepared you for the expectation of inconveniences Certainly the psycho-analytic method

dent I concluded this from the fact that of the many who interest themselves in my therapy and express a definite opinion on the same no

Act II scen 2

E t ely q kly gr bly —ED

makes high claims on the patient as w ll as the physician. From the first it requires the sac rifice of perfect candour it takes up much of his time and is therefore also xpen i e f r the physician t also means the l s of much time and, due t the t chniqu whi h he has to learn and practise t is quite laborious I even find t quite ju tified to employ more s t abl remedies s long as there is a prospect to achieve som thing with th m It comes to this point only if we gain by the m re laborious and cumbersome proced re cons derably more than by the short and easy ne the first is jus tified despite everything Just think gentlemen by how m ch the Finsen th rapy of lupus is more incon enient and expensi than the fo me ly used ca terization and craping and yet it means great progres merely because t achieves more it ctually cures the lupus rad ically I d not really wi h to carry through th comparison but psycho-analys s ca claim for itself a imilar pri ilege In reality I could develop and test my therapeuti m thod in gra e and in the gra est of cases only my ma terial at first con ted of patients who tried everything, unsucces fully and had pent years in asylums. I hardly gained no h experi nce to be ble t tell you h w m therapy beha es in those lighter episodi ally appearing di eases which we see cured under th m t di erse n fluences and also spontaneously Th psycho-analytic method wa reated fo patients who are permanently incapacit t d and ts triumph is t mak a gratifyin umbe of uch perma nently capacitated. Against this su cess all ex pense s insignificant. We can not conceal from oursel es what we were wont to disa ow to the patient namely that the s gnificance f a gra e neurosis f th indi idual subjected t t is ot less than any cachexia or any of the gen erally feared maladies.

(d) I view of the many practical limitations which I ha e encountered in my w k, I can hardly defi it ly enumerat the indications and ... t ment However ... bearer as a d... found ... mani ... psycho- ... or the ... on the treatment of neuropathi ... contrary t is limited by it. It is also not to be applied in persons who are not prompted by th ir own suffering to seek treatment but subject themsel es to it by order of their rel atives The characteristic feature upon which the usefulness of the psycho-analyt c treat me t depends the educability we will till ha e to cons der from another point of ew

If ne wishes to take a safe course he h uld limit his selection to persons of a nor mal tate f r in psycho-analytic procedures, it is from the n rmal that we seize upon the mo b d Psychoses confu onal states, and marked (I might say toxic) depress ns are unsuitable for a alysis, at lea t as it is prac tised toda I do n t think it at all imposs ble that with the proper changes in the procedure t will be po sible to di regard this contra indication and thus claim a psycho-therapy for the psychoses

3 The age of the patient also plays a part in th selection for the psycho-analytic treatment. P rsons ear or over the age of fifty lack, on th on hand the plastic ty f the psychic proc esses upon which the therapy depends (ld people re no longer educable) and on the other hand, the material which has to be elaborated and the duration of th treatment is immensely increased. The ea liest age limit is to be indi dually det rmined youthful persons e en be fore p berty are excellent subj cts for anal sis

4 One should not attempt psycho analysis when t is question of rap dly removing a threatening manifestation as for example in the case of an hysterical anorexia.

You ha e now gained the impression that the sphere of application of the analytic psycho-therapy is a ery limited one for you really heard m enumerate nothing but contra dica tions Nevertheless there remain sufficient cases and mo bid ates such as all chronic f rms of hysteri with remnant manifest tions th extens e realm of compul n states abu lias etc., on whi h this th rapy can be tried.

It is p eas n that part cularly the worthiest and highest devel ped perso can thus be most helped Where the analytic psycho-th rapy has ... complished but little n can chee fully as sert that any th treatment would ha e cer tainly resulted in n thing

refuse patient wh does n t possess certain degree f ed cation and whose harac r is t in measure reli ble. We must not forget that there are lso h althy persons who re ...

(e) You will surely wish to ask me about the possibility of doing harm through the ap plication of psycho analysis To this I will re ply that if you will judge justly you will meet this procedure with the same critical good feeling as you have met our other therapeutic methods and doing this you will have to agree with me that a rationally executed analytic treatment entails no dangers for the patient One who like a layman is accustomed to as cribe to the treatment everything occurring during the disease will probably judge differ ently It is really not so long since our hydro therapeutic institutes met with similar opposi tion Thus one who was advised to go to such a place became thoughtful because he had an acquaintance who entered the institute as nerv ous and there became insane As you may sur mise we dealt with cases of initial paresis who in the first stages could still be sent for hydro therapeutic help and who there merged into the irresistible cour e leading to manifest in sanity For the layman the water was the cause and author of this sad transformation Where it is a question of unfamiliar influences even doctors are not free from such mistaken judg ment I recall having once attempted to treat a woman by psycho therapy who passed a great part of her existence by alternating between mania and melancholia I begun to treat her at the end of a melancholia and everything seemed to go well for two weeks but in the third week she was again merging into a mania It was surely a spontaneous alternation of the morbid picture for two weeks is no time in which anything can be accomplished by psy cho therapy but the prominent—now deceased —physician who saw the case with me could not refrain from remarking that this chan e must have been due to the psycho therapy I am quite convinced that he would have been more critical under different conditions

(f) In conclusion gentlemen I must say to myself that it will not do to lay claim to your attention so long in favour of the analytic psy cho therapy without telling you of what this treatment consists and on what it is based To be sure I can only indicate it as I have to be brief This therapy is founded on the under standing that unconscious ideas—or rather the unconsciousness of certain psychic proce ses —are the main causes of morbid symptoms We share this conviction with the French school (Janet) which moreover by gross schematization reduces the hysterical symptom to an unconscious *idée fixe* Do not fear now that we will thus merge too far into this ob scurest philosophy Our unconscious is not quite the same as that of the philosophers and what is more most philosophers wish to know nothing of the *psychical unconscious* But if you will put yourselves in our position you will understand that the interpretation of the un conscious in patients psychic life into the con scious must result in a correction of their deviation from the normal and in an abrogation of the compulsion controlling their psychic life For the conscious will reaches as far as the conscious psychic processes and every psychic compulsion is substantiated by the unconscious You need never fear that the patient will be harmed by the emotions produced in entering from his unconscious into consciousness for you can theoretically readily understand that the somatic and affective activity of the emo tions which become conscious can never be come as great as those of the unconscious For we only control all our emotions by directing upon them our highest psychic activities and they are connected with consciousness

We can still choose another point of view for the understanding of the psycho-analytic treatment The revealing and interpreting of the unconscious takes place under constant re sistance on the part of the patient The emerg ing of the unconscious is connected with displeasure and owing to this displeasure it is continuously repulsed by the patient It is upon this conflict in the patient s psychic life that we encroach and if we succeed in prevailin upon him to accept something (for motives of better insight) which he has thus far repul ed (repressed) on account of the automatic ad justment of displeasure we have achieved in him a piece of educational work For it is really an education if we can induce a person to leave his bed early in the morning despite his unwil lingness to do so As such an after training for the overcoming of inner resistances you can conceive the psycho analytic treatment in quite a general manner

But in no sphere of the nervous patients is such an after training as essential as in the psychic elements of the sexual life For no where have culture and education produced as much harm as here and it is here as experi ence will show you that the controlling aetio logies of the neuroses are found The other aetiological element the constitutional contri bution is really given to us as something im mutable But this gives rise to an important demand on the doctor Not only must he be of

m_ldem_hed character—"morality is really a ma_er of course as the principal person in Theodor Vischer's A_ch Einer used to say—but he must have overcome in his own personality the mixture of lewdness and prudishness with which so many o_ers are wont to meet the sexual problems.

This is perhaps the place for a_o_her observation. I know that the empha_s which I laid on th_ exual role in the _nesis of t_e psychoneuroses has become widely known. But I also know tha_ restriction and nearer determinations are _f l_t_e use w_h the great public the multitude has little room in _s memory and generally retain_ from a _atement the bare nucleus thus creating for _tself an easily remembered extreme The same mi_h_ also have happened t_ some physicians whose faint notion _f my t_eory is that I trace back the neurosis in the last place t_ sexual privation. Of such there is surely no dearth under the vital condi_ons of our society But if that assumption were true, would it not seem obv_ous that, in order to avoid the roundabout way of the psych_c treatment a_d tend directly towards the cure we _hou_d directly recommend sexual activity as the remedy? I really do not know _t could induce me to suppress such conclusions if they were justi_ed. B_t the state _f a_airs is quit_ different. Sexual need o_ privation is merely one _f the factors playin_ a part in the mechanism of the neurosis and if it alone existed the resul_ would not be a disease but a dissipation. The othe_ equall_ indispensable factor which o_e is only too ready to f_rget, is the sexual repugnance of neurotics their inability to love _t is that psychic feature which I have designated as _repression. It is only from the con_ct between the two strivings t_a_ the neurotic malady _rigina_es, and _t is for this reason that the adv_ce for sexual activity can really only seldom be designa_ed as good in cases _f psychoneuroses.

Allow me to con_lude w_h this guarded remark. Let us hope t_at, with an interest for psychotherapy pur_ed _f all hostile prejudice you will help us t_ d_ som_ good in the treatment of the severe cases of psychoneuroses.

CHAPTER 9

MY VIEWS ON THE R_LE O_ _EXUALITY IN THE AETIOLOGY OF THE NEUROSIS

I AM of the opinion t_at my theory on the aetiological significa_ce of the sexual factor in the neuroses can b_ best appreciated by follow_i_g its development I will by no means make any e_ _rt to deny that it pa_sed throu_h an evolution d_ring which it underwent a cha_ge My colleagues can find the _ssura_ce in this admission that this theory is no_hing other than the resu_t of continued a_d pain_taking experiences. In contradi_inction to this, whatever origin_es from speculation can certainl_ appear complete at on_ go a_d continue unchanged.

Originally the theory h_d reference only to the morbid pictures comprehended as *neurasthenia* in which I found two types which occasionally appeared pure and which I described as *actual _eurasthen_a* and *anxiety neurosis* For it was alwa_s kn_wn that sexual factors could p_ay a part in the causation of these forms, but they were found neither regularly effective nor d_d we think of conced_ng to them a precedence over other _etiological i_nuences. I was above all *surprised* _t the frequency of coarse d_turbances in th_ *v_a sexualis* of nervous patients. The more I was in quest of such disturbances du_ng which I remembered that all men conceal the truth in things sexual, and the more _kilful I became in continu_g the examin_ion despite the incipient negation, the more regularly such disease-f_rmin_ factors were di_covered in the sexual life, until _t seemed to me that they were but little _hort of universal. But one must from the first be prepared f_ _imilar frequent occurrences of sexual irregularities under th_ stress of the social ... fore only place less value on the regular demonstration _f sexual *noxae* than on _ther experiences which appeared to me to be less equ_vocal. It was found t_at the form of the malady be_t neura_thenia or a_xiety neurosis _h_ws a constant re_ation to the f_rm of the sexual injury In the typical cases of neurasthenia, we _ould always demonstra_e masturbation or accumulated pollutions whil_ in anxiety neurosis we cou_d find such f_ctors as *coitus interrupt_us* frus'rated excitement, etc. The f_ctor of insufficient discharge of generated fluid seemed to be common to both Only after this experience which is easy t_ gain and very often confirmed, had I the courage to claim for the sexual i_uences a prominent place in the _etiology of the neurosis. It also happened that the mixed forms of neura_thenia and anx

From Löwenfeld, Sexualleben und Nervenleiden, 3rd., 906.

iety neurosis occurring so often showed the admixture of the aetiologies accepted for both and that such a bipartition in the form of the manifestations of the neurosis seemed to accord well with the polar characters of sexuality (male and female)

At the same time while I assigned to sexuality this significance in the origin of the simple neurosis I still professed for the psychoneuroses (hysteria and obsessions) a purely psychological theory in which the sexual factor was no differently considered than any other emotional sources Together with J Breuer and in addition to observations which he had made on his hysterical patients fully a decade before I have studied the mechanism of the origin of hysterical symptoms by the awakening of memories in hypnotic states We obtained information which permitted us to cross the bridge from Charcot s traumatic hysteria to the common non traumatic hysteria We reached the conception that the hysterical symptoms are permanent results of psychic traumas and that the amount of affect belonging to them was pushed away from conscious elaboration by special determinations thus forcing an abnormal road into bodily innervation The terms *strangulated affect conversion* and *ab reaction* comprise the distinctive characteristics of this conception

In the close relations of the psycho neuroses to the simple neuroses which can go so far that the diagnostic distinction is not always easy for the inexperienced it could happen that the cognition gained from one sphere has also taken effect in the other Leaving such influences out of the question the deep study of the psychic traumas al o leads to the same results If by the *analytic* method we continue to trace the psychic *traumas from which the hysterical symptoms* are derived we finally reach to experiences which belong to the patient s childhood and concern his sexual life This can be found even in such cases where a banal emotion of a non sexual nature has occasioned the outburst of the disease Without taking into account these sexual traumas of childhood we could neither explain the symptoms find their determination intelligible nor guard against their recurrence The incomparable significance of exual experiences in the aetiology of the psychoneuroses *seems therefore firmly* established and this fact remains until today one of the main supports of our theory

If we represent this theory by saying that the course of the life long hysterical neurosis lies in the sexual experiences of early childhood which are usually trivial in themselves it surely would sound strange enough But if we take cognizance of the historical development of the theory and transfer the main content of the same into the sentence Hysteria is the expression of a special behaviour of the sexual function of the individual and that this behaviour was already decisively determined by the first effective influences and experiences of childhood we will perhaps be poorer in a paradox but richer in a motive for directing our attention to a hitherto very neglected and most significant after-effect of infantile impressions in general

As I reserve the question whether the aetiology *of hysteria (and compulsion neurosis) is* to be found in the exual infantile experiences for a later more thorough discussion I now return to the construction of the theory expressed in some small preliminary publications in the years 1895 1896 The bringing into prominence of the assumed aetiological factors permitted us at the time to contrast the common neuroses which are maladies with an actual aetiology with the psychoneuroses which aetiology was in the first place to be sought in the sexual experiences of remote times The theory culminates in the sentence *In a normal* vita sexualis *no neurosis is possible*

If I still consider today this sentence as correct it is really not surprising that after ten years labour on the knowledge of these relations I passed a good way beyond my former point of view and that I now think myself in a position to correct by detailed exp rience the imperfections the displacements and the misconceptions from which thi theory *then suf*fered By chance my former rather meagre material furnished me with a great number of cases in which infantile histories sexual seduction by grown up persons or older children played the main role I overestimated the frequency of these (otherwise not to be doubted) occurrences the more so because I was then in no position to distinguish definitely the deceptive memories of hysterical patients concerning their childhood from the traces of the real processes whereas I have since then learned to explain many a seduction fancy as an attempt at defence against the reminiscences of their *own sexual activity (infantile* masturbation) The emphasis laid on the *traumatic* element of the infantile sexual experience disappeared with

See ch pt 7 bo e d "Th A tiol gy of Hysteria *C ll t d P p s I*

this explanation, and it remained obvious that the infantile sexual activities (be they spontaneous or provoked) dictate the course of the later sexual life after maturity. The same explanation, which really corrects the most significant of my original errors, perforce also changed the conception of the mechanism of the hysterical symptoms. These no longer appeared as direct descendants of repressed memories of infantile sexual experiences, but between the symptoms and the infantile impressions there cropped in the fancies (or fabrications of memory) of the patients which were mostly produced during the years of puberty and which, on the one hand, are raised from, and over the infantile memories and, on the other hand, are immediately transformed into symptoms. Only after the introduction of the element of hysterical fancies did the structure of the neurosis and its relation to the life of the patient become transparent. It also resulted in a veritable surprising analogy between these unconscious hysterical fancies and the romances which became conscious as delusions in paranoia.

After this correction, the *infantile sexual traumas* were in a sense surpassed by the *infantilism of sexuality*. A second modification of the original theory was not remote. With the accepted frequency of seduction in childhood there also disappeared the enormous emphasis on the accidental influences of sexuality to which I wished to shift the main role in the causation of the disease without, however, denying constitutional and hereditary factors. I even hoped to solve thereby the problem of the selection of the neurosis, that is, to decide by the details of the sexual infantile experience the form of the psychoneurosis into which the patient may merge. Though with reserve I thought at that time that passive behaviour during these scenes results in the specific predisposition for hysteria, while active behaviour results in compulsion neurosis. This conception I was later obliged to disclaim completely, though some facts of the supposed connection between passivity and hysteria and activity and compulsion neurosis, can be maintained to some extent. With the disappearance of the accidental influences of experiences the elements of constitution and heredity had to regain the upper hand, but, diverging from the view generally in vogue, I placed the *sexual constitution* in place of the general neuropathic predisposition. In my recent work, *The Contributions to the Theory of Sex* I have attempted to discuss the varieties of this sexual constitution, the components of the sexual impulse in general, and its origin *from the contributory sources* of the organism.

Still in connection with the changed conception of the *sexual infantile traumas* the theory continued to develop in a course which was already indicated in the publications of 1894–1896. Even before sexuality was installed in its proper place in the aetiology I had already stated as a condition for the pathogenic efficaciousness of an experience that the latter must appear to the ego as unbearable and thus evoke an exertion for defence. To this defence I have traced the psychic splitting—or as it was then called, the splitting of consciousness—of hysteria. If the defence succeeded, the unbearable experience with its resulting affect was expelled from consciousness and memory, but under certain conditions the thing expelled which was now unconscious, developed its activity, and, with the aid of the symptoms and their adhering affect, it returned into consciousness so that the disease corresponded to a failure of the defence. This conception had the merit of entering into the play of the psychic forces and hence approximated the psychic processes of hysteria to the normal, instead of shifting the characteristic of the neurosis into an enigmatic and no-further analyzable disturbance.

Further inquiries among persons who remained normal furnished the unexpected result that the sexual histories of their childhood need not differ essentially from the infantile life of neurotics, and that especially the role of seduction is the same in the former, so the accidental influences receded still more in comparison to the factors of *repression* (which I began to use instead of *defence*). It really does not depend on the sexual excitements which an individual experiences in his childhood, but above all on his reactions towards these experiences, and whether these impressions responded with *repression* or not. It could be shown that spontaneous sexual manifestations of childhood were frequently interrupted in the course of development by an act of repression. The sexual maturity of neurotic individuals thus regularly brings with it a fragment of *sexual repression* from childhood, which manifests itself in the requirements of real life. Psychoanalysis of hysterical individuals shows that the malady is the result of the conflict between the libido and the sexual repression and that their symptoms have the value of a compromise between both psychic streams.

First published in 1905

iety neurosis occurring so often showed the *admixture of the aetiologies accepted for both* and that such a bipartition in the form of the manifestations of the neurosis seemed to accord well with the polar characters of sexuality (male and female)

At the same time while I assigned to sexuality this significance in the origin of the simple neurosis I still professed for the psychoneuroses (hysteria and obsessions) a purely psychological theory in which the sexual fac*tor was no differently considered than any other* emotional sources Together with J Breuer and in addition to observations which he had made on his hysterical patients fully a decade before I have studied the mechanism of the origin of hysterical symptoms by the awakening of memories in hypnotic states We obtained information which permitted us to cross the bridge from Charcot s traumatic hysteria to the common non traumatic hysteria We *reached the conception that the hysterical* symptoms are permanent results of psychic traumas and that the amount of affect belonging to them was pushed away from conscious elaboration by special determinations thus forcing an abnormal road into bodily innervation The terms *strangulated affect conversion* and *ab reaction* comprise the distinctive characteristics of this conception

In the close relations of the psycho neuroses *to the simple neuroses which can go so far that* the diagnostic distinction is not always easy for the inexperienced it could happen that the cognition gained from one sphere has also taken effect in the other Leaving such influences out of the question the deep study of the psychic traumas also leads to the same results If by the *analytic* method we continue to trace the psychic traumas from which the hysterical symptoms are derived we finally reach to experiences which belong to the patient s childhood and concern his sexual life This can be found even in such cases where a banal emotion of

neither explain the symptoms find their determination intelligible nor guard against their recurrence The incomparable significance of sexual experiences in the aetiology of the psychoneuroses seems therefore firmly established and this fact remains *until today one of* the main supports of our theory

If we represent this theory by saying that the course of the life long hysterical neurosis lies in the sexual experiences of early childhood which are usually trivial in themselves it surely would sound strange enough But if we take cognizance of the historical development of the theory and transfer the main content of the same into the sentence Hysteria is the expression of a special behaviour of the sexual function of the individual and that this behaviour was already decisively determined by the first effective influences and experiences of childhood we will perhaps be *poorer in a paradox but richer in a motive for* directing our attention to a hitherto very neglected and most significant after effect of infantile impressions in general

As I reserve the question whether the aetiology of hysteria (and compulsion neurosis) is to be found in the sexual infantile experiences for a later more thorough discussion I now return to the construction of the theory expressed in some small preliminary publications in the years *1895 1896 The bringing into promi*nence of the assumed aetiolo ical factors permitted us at the time to contrast the common neuroses which are maladies with an actual aetiology with the psychoneuroses which aetiology was in the first place to be sought in the sexual experiences of remote times The theory culminates in the sentence *In a normal* vita sexualis *no neurosis is possible*

If I still consider today this sentence as correct it is really not surprising that after ten years labour on the knowledge of these relations I passed a good way beyond my former point of view and that I now think myself in a position to correct by detailed experience the imperfections the displacements and the misconceptions from which thi theory *then suf*fered By chance my former rather meagre material furnished me with a great number of cases in which infantile histories sexual seduction by grown up persons or older children played the main role I overestimated the frequency of these (otherwise not to be doubted) occurrences the more so because I was then in no position to distinguish definitely the deceptive memories of hysterical patients concerning their childhood from the traces of the real processes whereas I have since then learned to explain many a seduction fancy as an attempt at defence against the reminiscences of their own sexual activity (infantile masturbation) The emphasis laid on the *traumatic* element of the infantile sexual experience disappeared with

If the defence ucceeded, the u arable experience with its resulting ffect was expelled from co..sciousness a..d memory but under certain c nditions the thing expelled which was now uncon..cious, developed its act v a. d with the aid of the sympt ms and their adher ing affect it returned into consciousness so that the disease corresponded to a fa lure of the defence This concept on had the merit of entering into the play of the ps ch c forces and hence approximated the psychic processes of h steria to the normal in..tead of hifting the characteri..tic of the neurosis into an en gmatic and no-furthe an l zable di.tu bance

Further inquiries among persons who remained normal furni hed the unexpected result that the sexual hi tories of the ch. dhood need not differ essent ally from the fantile l fe of neurotics, and that especially the rô e of sed c tio is the same in the f rmer so the acci d tal infl ences receded st'll more i com pari..on to the factors of *r pression* (which I

abo e all o his re ct ons towards these experi- nces and wh ther these impres ons respond ed with *r pression* or not It could be hown that po taneous sexual man fest ti of child hood were frequentl in errupted in the co rs of d velopment by an act of repress on The sexual maturity of neurotic ind iduals thus regularl b ings with it a fragme t of *sexu..l re sion* from childhood wh. h manifes s it elf in the requireme ts f real life Psycho-analy sis of h st rical indi d al h ws that the ma..ady the esult of the conflict between the lib d and the sexual repres d that thei symptoms ha e th alue of a compromise between bo..h psychi streams.

Without a comprehensive discussion of my conception of repression I could not explain any further this part of the theory It suffices to refer here to my *Three Contributions to the Theory of Sex* where I have made an attempt to throw some light on the somatic processes in which the essence of sexuality is to be sought I have stated there that the constitutional predisposition of the child is more irregularly multifarious than one would expect that it deserves to be called *polymorphous perverse* and that from this predisposition the so called normal behaviour of the sexual functions results through a repression of certain components By referring to the infantile character of sexuality I could form a simple connection between normal perversions and neurosis The normal resulted through the repression of certain partial impulses and components of the infantile predisposition and through the subordination of the rest under the primacy of the genital zones for the service of the function of procreation The perversions corresponded to disturbances of this connection due to a superior compulsive like development of some of the partial impulses while the neurosis could be traced to a marked repression of the libidinous strivings As almost all perversive impulses of the infantile predisposition are demonstrable as forces of symptom formation in the neurosis in which however they exist in a state of repression I could designate the neurosis as the *negative* of the perversion

I think it worth emphasizing that with all changes my ideas on the aetiology of the psychoneuroses still never disavowed or abandoned two points of view to wit the estimation of *sexuality* and *infantilism* In other respects we have in place of the accidental influences the constitutional factors and instead of the pure psychologically intended *defence* we have the organic *sexual repression* Should anybody ask where a cogent proof can be found for the asserted aetolo ical significance of sexual factors in the psychoneuroses and argue that since an outburst of these diseases can result from the most banal emotions and even from somatic causes a specific aetiology in the form of special experiences of childhood must therefore be disavowed I mention as an answer for all these arguments the psycho analytic investigation of neurotics as the source from which the disputed conviction emanates If one only makes use of this method of investigation he will discover that the *symptoms represent the whole or a partial sexual manifestation of the patient* from the sources of the normal or perverse partial impulses of sexuality Not only does a good part of the hysterical symptomatology originate directly from the manifestations of the sexual excitement not only are a series of erogenous zones reinforcing infantile attributes raised in the neurosis to the importance of genitals but even the most complicated symptoms become revealed as the converted representations of fancies having a sexual situation as a content He who can interpret the language of hysteria can understand that the neurosis only deals with the repres ed sexuality One should however understand the sexual function in its proper sphere as circumscribed by the infantile predisposition Where a banal emotion has to be added to the causation of the disease the analysis regularly shows that the sexual components of the traumatic experience which are never missing have exercised the pathogenic effect

We have unexpectedly advanced from the question of the causation of the psychoneuroses to the problem of its nature If we wi h to take cognizance of what we have discovered by psycho analysis we can only say that the nature of these maladies lies in disturbances of the sexual processes in those processes of the organism which determine the formation and utilization of the sexual libido We can hardly avoid imagining these processes in the last place as chemical so that we can recognize in the so called actual neuroses the somatic effects of disturbances in the sexual metabolism while in the phychoneuroses we recognize besides the psychic effects of the same disturbances The resemblance of the neuroses to the manifestations of intoxication and abstinence following certain alkaloids and to Basedow s and Addison s diseases obtrudes itself clinically without any further ado and just as these two disea es should no more be described as *nervous diseases* so will the genuine neuroses soon have to be removed from this class despite their nomenclature

Everything that can exert harmful influences in the processes serving the sexual function therefore belongs to the aetiology of the neurosis In the first place we have the noxae directly affecting the sexual functions insofar as they are accepted as injuries by the sexual constitution which is changeable through culture and breeding In the second place we have all the different noxae and traumas which may also injure the sexual processes by injuring the organism as a whole But we must not forget that

...ional problem of the neuroses is at

almost ... multiplicity of aetiological factors reinto ... ing one another and which can not be brou ht in contrast to one an ther It is for that reason that the state of neurotic illness is not sharply separated from the normal. The disease is the result f summation and the measure of the etiological determinations can be compl ted from any one part. To seek the a tiology f the neurosis exclu ely in heredity or in the con stitu on, would be o less one ded than to attempt to raise to the aetiology the accidental influences of exuality alone even though the explanations show that the nature of this mala dy lies only in a disturbance of the sexual proc esses of the organism

CHAPTER 10
HYSTERICAL FA CIES A D THEIR RELATIO S TO BISEXUALITY

THE delusional formations of paranoiacs con taining the greatness and sufferings of th r own ego which manifest themselves quite typ cally in almost mo otonous forms ar uni ersally familiar Furtherm re through num rous c m munications we becam acquaint d with the pe culiar organizations by means of which certain perverts put int operatio th ir sexual gratifi cations, be it in fancy or reality On the other hand, *it may sound rather no el to som to* hea that quite analogous psychic formations regularly appea in all psychoneuroses espe cially in hysteria, and that these so-called hys terical fancies show mportant relations to the causation of eurotic sympt ms

Of the same so ce and of the normal proto type re all these fantasti creations so-called reveries of y uth, which ha already gained rtain onsiderat in th literature though ot sufficient one They are pe haps equally frequent in both sexes in girls and *women they* seem to be wholly of erotic nature whil in men they are f an eroti amb t us nature Yet even in me the importan f th erotic f ct r is not t be put in the second place fo on examining more closely the reveries of men we generally learn that all these hero c acts are accomplished that all these successes are ac quired in order to please a woman and to be preferred to other men These fancies are wish gratifications which emanate from pri ation *and longing They are* justly named *day d eams* f r they gi e the key for the understanding of night dreams in which the nucleus of the dream format on is produced by just such complicat ed disfigured day fancies which are misunder stood by the co scious psychic judgment

These day dreams are garnished with great interest, are cautiou ly nurtured and coyly guarded as if they were numbered among the mo t intimate estates of personal ty On the street however the day d eamer can be read ily recognized by a sudden as if bsent minded, smile by talking t himself or by a running like acceleration of hi gait where n he desig nates the acme f the imaginary s tuation.

All hysterical attacks which I ha e been thus far able to examine proved *to be of such in oluntary incursions of day dreams.* Observa tion lea es no doubt that such fancies may ex ist as unconscious or conscious and whenever they become unc n cious they may lso be come pathogenic, that is they may express themsel es *in symptoms* and attacks Under fa vourable co ditions it is possible for conscious ness to seize su h unc nscious fancies. One f my patients, whose attention I ha e called to her fancies narrated that once while n the street she *suddenly* found herself in tears, and rap dly reflecting o er the cause f her weep ing th fancy became clear to her She fancied herself in delicate relationship with a piano vir tuoso familiar in the city but whom she did not know personally In her fancy he bore him a child (she was childless) and he then deserted her leaving her and her child in misery At this passag of the romance she burst into tears

The unconsci us fancies are either from the first un on cious having been formed in the *unconsci us, or which is m re frequently* the case they were on nscious fancies day dreams and were then intentionally f rgotten merging into the unconscious by *pression* Their ont nt then e the remained the same or und rwent a transf rmation so that the present unco cious fancy represents a descendant of th ce consci us one Th unc nscio f ncy stands in ery important rel ti n to the sex ual lif f the person t is really identical with that fancy which helped it tow rds sexual grat

H. Ellis imila ly expresses h mself ... cit
C mpare Freud, *I terpr t on f Dr m*

ification during a period of masturbation The masturbating act (in the broader ense the onanistic) then consisted of two parts the evo cation of the fancy and the active performance of self gratification at the height of the same This combination is familiarly in it elf a kind of soldering Originally this action was a pure ly auto-erotic undertaking for the pleasure ob tained from a certain so called *erogenous* part of the body Later this action blended with a *wish pre entation from the phere of object* love and served for a partial realization of the situation in which this fancy culminated If then the person forgoes in this manner the masturbo fantastic gratification the action re mains undone the fancy however changes from a conscious to an unconscious one If no other manner of sexual gratification occurs if the person remains abstinent and does not suc ceed in sublimating his libido that is in divert ing the sexual excitement to a higher aim we then have the conditions for the refreshment of the unconscious fancy It then grows exuber antly and with all the force of the desire for love at least a fragment of its content becomes a morbid symptom

The unconscious fancies are then the nearest psychical first steps of a whole series of hys terical symptoms The hysterical symptoms are nothing other than unconscious fancies brought to light by *conversion* and insofar as they are somatic symptoms they are frequently enough taken from the spheres of the sexual feelings and motor innervations which originally accom panied the former still conscious fancies In this way the disuse of onanism is really made retrogressive and the final aim of the whole pathological process the restoration of the pri mary sexual gratification though it never be comes perfect in a manner always achieves a certain resemblance

The interest of him who studies hysteria turns directly from the symptoms to the fan cies from which the former originate The tech nique of psycho analysis gives the means of finding out from the symptoms these uncon scious fancies and of bringing them back to the patient s consciousness In this way it was

perverts Those who lack examples of such na ture need only recall the historical achievements of the Roman Caesars whose frenzies were nat urally only conditioned by the unrestricted po-tency of the fancy-creator The delusional for mations of paranoiacs are the same but they are phantasies which immediately become con scious and are borne by the sado masochistic components of the sexual instinct Complete counterparts of these can also be found in cer tain unconscious phantasies of hysterics It is a familiar practically important fact that hys terics express their phantasies not as symptoms but as conscious realization and in this way *they feign and commit murders assaults and* sexual aggressions

All that can be found out about the sexuality of the psychoneurotic can be ascertained by psycho analytic investigation which leads from the obtrusive symptoms to the hidden uncon scious phantasies It also furnishes the fact of this small preliminary communication which is to be reported here

Probably because of the difficulties which stand in the way of the effort of the uncon scious phantasies to express themselves the re lation of the phantasies to the symptoms is not simple but rather manifoldly complicated As a rule i e in a fully developed and long stand ing neurosis a symptom does not correspond to one unconscious phantasy but to a number of such and indeed not in arbitrary but in law ful combination To be sure in the beginning of the disease all these complications are not yet developed

For the sake of general interest I pass over the connection of this communication and add a series of formulæ which strive progressively to exhaust the nature of hysteria They do not contradict one another but correspond partly to more complete and sharper conceptions and part ly to the application of different points of view

1 The hysterical symptom is the memory symbol of certain effective (traumatic) impres sions and experiences

2 The hysterical symptom is the associa tive return of this traumatic experience or a substitute produced by *conversion*

3 The hysterical symptom—like all other psychic formations—is the expression of a wish realization

4 The hysterical symptom is the realization of one of the unconscious phantasies servin as a wish fulfillment

5 The hysterical symptom serves as a sex ual gratification and represents a part of the

Cf Three C t ib t s to the Th o y f Se

Th sam h ld tru f th rel t betwee the *l t t* th ghts of the d eam d the lements f the *m f t* co t t f th dream See the Chapt the D m W k l th th *r I terpr tat of D e m p* 52 below

sexual life of the individual (corresponding to one of the components of his sexual impulse)

6 The hysterical symptom corresponds to the return of one form of the sexual gratification which was real in infantile life but had been repressed *since then*

7 The hysterical symptom results as a compromise between two opposing affects or impulses one of which strives to bring to realization a partial impulse or a component of the sexual constitution, while the other strives to suppress the same

8 The hysterical symptom may represent diverse unconscious non-sexual impulses but cannot dispense with the sexual meaning

It is the seventh among these determinants which expresses most exhaustively the nature of the hysterical symptom as a realization of an unconscious phantasy and it is the eighth which evaluates in fitting manner the significance of the sexual factor Some of the preceding formulæ are contained as first steps in this formula.

In view of these relations between symptoms and phantasies one can readily reach from the psycho-analysis of the symptoms to the knowledge of the components of the sexual impulse controlling the individual, just as I have shown in the *Three Contributions to the Theory of Sex* But in some cases this examination gives rather unexpected results It shows that many symptoms cannot be solved by one unconscious sexual phantasy by a series of phantasies in which the most significant and most primitive is of a sexual nature but that in order to solve the symptoms two sexual phantasies are required, of the masculine and one of the feminine character so that one of these phantasies corresponds to a homosexual impulse. The theory expressed in formula seven is in no way affected by this novelty so that an hysterical symptom necessarily corresponds to a compromise between a libidinal and repressed emotion, but, besides that, it can correspond to a union of two libidinal phantasies of contrary sexual characters

I refrain from giving examples for this theory Experience has taught me that short analyses compressed into the form of an abstract can never make the desired impression for which they were intended. The communication of fully analyzed cases must, however be reserved for another place

I therefore content myself with the fact of formulating the theory and elucidating its meaning

9. An hysterical symptom is the expression on the one hand of a masculine and, on the other hand of a feminine unconscious sexual phantasy

I expressly observe that I am unable to adjudge to this theory the same general validity that I claimed for the other formulæ *As far as* I can see it neither fits into all symptoms of a single case *nor into all cases* On the contrary it is not difficult to find cases in which the contrary sexual emotions have found separate [illegible] hat the symptoms

[illegible]

terical symptoms can attain and can only be expected in a long-standing neurosis wherein a great amount of organization has taken place.

The demonstrable bisexual significance of hysterical symptoms in many cases is indeed an *interesting* confirmation of the assertion formulated by me that the supposed bisexual predisposition of man can be especially recognized in psychoneurotics by means of psycho-analysis Quite an analogous process from the same sphere is that in which the masturbator in his conscious phantasies attempts to live *through in his imagination the fancied* situations of both the man and the woman Other counterparts are found in certain hysterical crises in which the patients play both roles lying at the basis of sexual phantasies thus for example one of the cases under my observation pressed his garments to his body with one *arm (as a woman) and with the other* arm attempted to tear them off (as a man) This contradictory simultaneity determines for the most part the incomprehensiveness of the situation otherwise so plastically represented in the attack and is excellently suited for the concealment of the affective unconscious phantasy

In psycho-*analytical treatment* it is very important to be prepared for the bisexual meaning of a symptom It should not be at all surprising or misleading when a symptom remains

Indeed, J Sadger who recently discovered the theory in question independently by psycho-analysis claims for [illegible] general validity (*Die Bedeutung der psychoanal* [illegible] *F eud Zentralbl. f Nerv P ych* [illegible])

Freud, *Three Contributions to the Theory of Sex*

apparently undiminished in spite of the fact that one of its sexual determinants is already solved It may still be based on the unsuspected contrary sexual element Moreover during the treatment of such cases we can observe how the patient makes use of this convenience While analyzing one of the sexual meanings he continually switches his thoughts into the sphere of the contrary meaning as if onto an adjacent track

The Sexual Enlightenment of Children [1]

An Open Letter t Dr M. Furst Editor of *Soziale Medizin und Hygiene*

DEAR SIR When you ask m fo an expres on of opinion on the matt r of sexual enli hten men for children, I assum that what y u wan is the independent opinion f an di nd ual physician whose professional work offers him special opportunities f r tudying the subject, and n t regular c ventional treatise dealing with all the mass of literature that has grown up around t. I am ware that ou ha e and not e I

regard the psycho-sexual constitution and cer tain norm in th sexual life as the most im portant causes of th neurotic disorders that are so common. My *Three Contrib t ons to the Th ory f Sex* in which I describe the components of which the sexual instinct is made up, and the disturbances which may occur in its development int the functi n f sexuality has recently received f vourable mention in your journal.

I am, therefore t answer the questions whethe children may be given any information at all in regard t the f cts of sexual life and t what and in what wa this should be done Now I t m confes at the outset that discussion with regard to the econd and third points seems to m perfectly reasonabl but that t m mind it is quit in ceivable how the first of these questions could eve be the sub ct f d bat What can be the aim of withholding from children, let us say from young peop. this information bout the sex ual li f human beings? Is it fea of arousing interest in su h matters prem turely be fore t spontaneously stirs in them Is t hope of retarding by con ealment of this kind the development of the sexual instinct in general, until h time as t can find s way in o the onl chann ls open t t in th civilized social order Is t supposed that children would h w interest understanding for the f cts and riddles of sexual lif if they were t promp ed

from which th ir parents and teacher would keep them apart as lo g as possible?

I am really at a loss to say which of these ca be th mot e f r the customary concealment from children of everything c nnected with sex. I nl know that these arguments are o e and all equall foolish, and that I find t difficult to pay them the c mpliment of serious refutation. I remember howeve that n the letters of that great thinker and friend f hu manity Multatuli I once found a few l es which are more than adequate as an answer

To my mind it seems that certain things re altogether too much wrapped in mystery It is well to keep the fa t es of children pure but their purity will n t be preserved by ig orance On the co trary I believe that concealment leads a girl r boy to uspect the truth more than ever Curiosity leads to prying into things which would ha e roused little or no i erest if they were talked of openl with

which things he has already surmised re treat

that the hild is already in er while his par ents till believe he does n t know what sin is

I d ot know h w the case could be better stated th ugh perhaps ne might amplify it. It is urely n thing else but habitual prudery and a guilty nscience in themselves abou sexual matters which causes adul t adopt this attitud of myst ery towards children possibly however a pi ce f theoretical ign ran on th part, to be counteracted only by fresh inf rmation, is also respon ibl It is comm nly

Multatuli, *Brie* (906) I, 6

believed that the sexual instinct is lacking in children and only begins to arise in them when the sexual organs mature This is a grave error equally serious from the point of view both of theory and of actual practice It is so easy to correct it by observation that one can only wonder how it can ever have arisen As a matter of fact the new born infant brings sexuality with it into the world certain sexual sensations attend its development while at the breast and during early childhood and only very few children would seem to escape some kind of sexual activity and sexual experiences before puberty A more complete exposition of this statement can be found in my *Three Contributions to the Theory of Sex* to which reference has been made above The reader will learn that the specific organs of reproduction are not the only portions of the body which are a source of pleasurable sensation and that Nature has stringently ordained that even stimulation of the genitals cannot be avoided during infancy This period of life during which a certain degree of directly sexual pleasure is produced by the stimulation of various cutaneous areas (eroto enic zones) by the activity of certain biological impulses and as an accompanying excitation during many affective states is designated by an expression introduced by Havelock Ellis as the period of auto erotism Puberty merely brings about attainment of the stage at which the genitals acquire supremacy among all the zones and sources of pleasure and in this way presses erotism into the service of reproduction a process which naturally can undergo certain inhibitions in the case of those persons who later on become perverts and neurotics this process is only incompletely accomplished On the other hand the child is capable long before puberty of most of the mental manifestations of love for example tenderness devotion and jealousy Often enough the connection between these mental manifestations and the physical sensation of sexual excitation is so close that the child cannot be in doubt about the relation between the two To put it briefly the child is long before puberty a being capable of mature love lacking only the ability for reproduction and it may be definitely asserted that the mystery which is set up withholds him only from intellectual comprehension of achievements for which he is psychically and physically prepared

The intellectual interest of a child in the riddle of sexual life his desire for knowledge finds expression at an earlier period of life than is usually suspected If they have not often come across such cases as I am about to mention parents must either be afflicted with blindness in regard to this interest in their children or when they cannot overlook it must make every effort to stifle it I know a splendid boy now four years old whose intelligent parents abstain from forcibly suppressing one side of the child s development Little Herbert who has certainly not been exposed to any seducing influence from servants has for some time shown the liveliest interest in that part of his body which he calls his wee wee maker When only three years old he asked his mother Mamma have you got a weewee maker too? His mother answered, Of course what did you think? He also asked his father the same question repeatedly At about the same age he was taken to a barn and saw a cow milked for the first time Look milk is coming out of the weewee maker! he called in surprise At the age of three and three quarters he was well on the way to establish correct categories by means of his own independent observation He saw how water is run off from a locomotive and said See the engine is making weewee but where is its wee wee maker? Later on he added thoughtfully Dogs and horses have weewee makers but tables and chairs don t have them Recently he was watching his little sister of one week old bein bathed and remarked Her weewee maker is still tiny it will get big er when she grows (I have heard of this attitude towards the problem of sex difference in other boys of the same age) I must expressly assert that Herbert is not a sensual child nor even morbidly di posed in my opinion since he has never been frightened or oppressed with a sense of guilt he gives expression quite ingenuously to what he thinks

The second great problem which exercises a child s mind—probably at a rather later date —is that of the origin of children and is usually aroused by the unwelcome arrival of a baby brother or sister This is the oldest and most burning question that assails immature humanity those who understand how to interpret myths and legends can detect it in the riddle which the Theban Sphinx set to Oedipus The answers usually given to children in the nursery wound the child s frank and genuine spirit of investigation and generally deal the first blow at his confidence in his parents from this time onwards he commonly begins to mistrust grown up people and keeps to himself

what interests him most. The following letter may show how torturing this very curiosity may become in older children. It was written by a motherless girl of eleven and a half who had been puzzling over the problem with her younger sister.

DEAR AUNT MALI: Please will you be so kind as to write and tell me how you got Chris or Paul. You must know because you are married. We were arguing about it yesterday and we want to know the truth. We have nobody else to ask. When are you coming to Salzburg? You know, Aunt Mali, we simply can't imagine how the stork brings babies. Trudel thought the stork brings them in a shirt. Then we want to know too, how the stork gets them out of the pond, and why one never sees babies in ponds. And please will you tell me, too, how you know beforehand when you are going to have one. Please write and tell me all about it. Thousands of kisses from all of us.

Your inquiring niece

LILY

I do not think that this touching request brought the two sisters the information they wanted. Later on the writer developed the neurosis that arises in unanswered unconscious questions—obsessive speculating.

I do not think that there is even one good reason for denying children the information which their thirst for knowledge demands. To be sure, if it is the purpose of educators to stifle the child's power of independent thought as early as possible, in order to produce that good behaviour which is so highly prized, they cannot do better than deceive children in sexual matters and intimidate them by religious means. The stronger characters will, it is true, withstand these influences; they will become rebels against the authority of their parents and later against every other form of authority. When children do not receive the explanations for which they turn to their elders, they go on tormenting themselves in secret with the problem, and produce attempts at solution in which the truth they have guessed is mixed up in the most extraordinary way with grotesque inventions; or else they whisper confidences to each other which, because of the sense of guilt in the youthful inquirers, stamp everything sexual as horrible and disgusting. These infantile sexual theories are well worth collecting and examining. After these experiences children usually lose the only proper attitude to sexual questions, many of them never to find it again.

It would seem that the overwhelming majority of writers, both men and women, who have dealt with the question of explaining sexual matters to children have expressed themselves in favour of enlightenment. The clumsiness, however, of most of their proposals how and when this enlightenment should be carried out leads one to conclude that they have not found it very easy to venture this admission. As far as my knowledge of the literature goes, the charming letter of explanation which a certain Frau Emma Eckstein gives as written to her ten-year-old boy stands out conspicuously.[1] The customary method is obviously not the right one. All sexual knowledge is kept from children as long as possible, and then on one single occasion an explanation, which is even then only half the truth and generally comes too late, is proffered them in mysterious and solemn language. Most of the answers to the question, 'How can I tell my children?' make such a pitiful impression, at least upon me, that I should prefer parents not to concern themselves with the explanation at all. It is much more important that children should never get the idea that one wants to make more of a secret of the facts of sexual life than of any other matter not suited to their understanding. To ensure this it is necessary that from the very beginning everything sexual should be treated like everything else that is worth knowing about. Above all, schools should not evade the task of mentioning sexual matters; lessons about the animal kingdom should include the great facts of reproduction, which should be given their due significance, and emphasis should be laid at the same time on the fact that man shares with the higher animals everything essential to his organization. Then, if the atmosphere of the home does not make for suppression of all reasoning, something similar to what I once overheard in a nursery would probably occur oftener. A small boy said to his little sister: 'How can you think the stork brings babies! You know that man is a mammal; do you suppose that storks bring other mammals their young too?' In this way the curiosity of children will never become very intense, for at each stage in its inquiries it will find the satisfaction it needs. Explanations about the specific circumstances of human sexuality and some indication of its social significance should be provided before the child is eleven years old. The age of confirmation would be a more

suitable time than any other at which to instruct the child who already has full knowledge of the physical facts involved in those social obligations which are bound up with actual gratification of this instinct A gradual and progressive course of instruction in sexual matters such as this at no period interrupted in which the school takes the initiative seems to me to be the only method of giving the necessary information that takes into consideration the development of the child and thus successfully avoids ever present dangers

I consider it a most significant advance in the science of education that in France in place of the catechism the State should have introduced a primer which gives the child his first instruction in his position as a citizen and in the ethical obligations which will be his in time to come The elementary instruction provided there however is seriously deficient in that it includes no reference to sexual matters Here is the omission which stands in such need of attention on the part of educators and reformers In those countries which leave the education of children either wholly or in part in the hands of the priesthood the method urged would of course not be practicable No priest will ever admit the identity in nature of man and beast since to him the immortality of the soul is a foundation for moral training which he cannot forgo Here again we clearly see the unwisdom of putting new wine into old bottles and perceive the impossibility of carrying through a reform in one particular without altering the foundations of the whole system

The Future Prospects of Psycho-Analytic Therapy[1]

AN ADDRESS DELIVERED BEFORE THE SECOND INTERNATIONAL PSYCHO-ANALYTICAL CONGRESS AT NUREMBERG IN 1910

Since the objects for which we are assembled here today are mainly practical, I shall choose a practical theme for my introductory address and appeal to your interest as medical, not as scientific, men. I can imagine what your opinion about the success of our therapy probably is, and I assume that most of you have already passed through the two stages which all beginners go through, that of enthusiasm at the unexpected increase in our therapeutic achievements, and that of depression at the magnitude of the difficulties which stand in the way of our efforts. Whichever of these stages in development, however, each of you may happen to be going through at the moment, my intention today is to show you that we have by no means come to the end of our resources for combating the neuroses and that we may expect a substantial improvement in our therapeutic prospects before very long.

This improvement will come, I think, from three sources:

1. From internal progress.
2. From increased prestige.
3. From the general effect of our work.

1. Under internal progress I understand advances (a) in our analytical knowledge, (b) in our technique.

(a) Advances in our knowledge. We are, of course, still a long way from knowing all that is required for an understanding of the unconscious minds of our patients. Now it is clear that every advance in our knowledge means an increase in the power of our therapy. As long as we understood nothing we accomplished nothing; the more we understand the more we shall achieve. At its beginning, psycho-analytic treatment was inexorable and exhaustive. The patient had to say everything himself, and the physician's part consisted of urging him on incessantly. Today things have a more friendly air. The treatment is made up of two parts—out of what the physician infers and tells the patient, and out of the patient's work of assimilation, of working through what he hears. The mechanism of our curative method is indeed quite easy to understand. We give the patient the conscious idea of what he may expect to find (*bewusste Erwartungsvorstellung*) and the similarity of this with the repressed unconscious one leads him to come upon the latter himself. This is the intellectual help which makes it easier for him to overcome the resistances between conscious and unconscious. Incidentally I may remark that it is not the only mechanism made use of by the analytic method; you all know the far more powerful one which lies in the use of the *transference*. I intend soon to undertake an exposition of these various factors which are so important for an understanding of the cure, in a practice of psycho-analysis. And further, in speaking to you I need not rebut the objection that the way in which we practise the method today obscures its testimony to the correctness of our hypotheses; you will not forget that this evidence is to be found elsewhere, and that a therapeutic procedure cannot be performed in the same way as a theoretical investigation.

Now let me refer briefly to various fields in which we both have much to learn that is new and do actually make new discoveries daily. First of all, there is the matter of symbolism in dreams and in the unconscious—a fiercely contested subject, as you know! It is no small credit to our colleague, W. Stekel, that, indifferent to all the objections of our opponents, he has undertaken a study of dream-symbolism. In this there is indeed much still to learn; my *Interpretation of Dreams*, which was written in 1899, awaits important amplification from researches into symbolism.

I will say a few words about one of the symbols that has lately been recognized. Not long ago it came to my knowledge that a psychologist whose views are not too distant from ours had remarked to one of us that we undoubtedly overestimated the hidden sexual significance of dreams: his most frequent dream was of going upstairs and there could certainly be nothing sexual about that. Our attention be-

[1] Collected Papers, ii. First published in Zentralblatt, Bd. I. Reprinted in Sammlung, Zweite Folge.

ing thus drawn to it we began to study the incidence of stairs steps and ladders in dreams and soon could establish the fact that stairs and such things are certainly a symbol of coitus The underlying element which the two things have in common is not difficult to discover one climbs an acclivity in rhythmic movements accompanied by increasing breathlessness and in a few rapid leaps can be down again Thus the rhythm of coitus reappears in climbing steps We will not forget to adduce the usages of speech in this connection It shows us that *mounting* is used quite simply as a symbol for the sexual act In German one says the man is a *Steiger nachsteigen* In French the steps of a stair are called *marches un vieux marcheur ein alter Steiger* both mean an old profligate The dream material from which these newly recognized symbols are derived will in due time be put before you by the committee we are about to form for collecting and studying symbols An account of another interesting symbol of the idea of *rescue* and its changes in significance will appear in the second volume of our *Jahrbuch* However I must break off here or I shall not reach my other points

Every one of you will know from his own experience the total change in one s attitude to a new case when once one has thoroughly mastered the structure of some typical cases of illness Assuming now that we had narrowly defined the regular elements in the composition of the various forms of neurosis just as we have already succeeded in doing for hysterical symptom formation how much more assured we should be in our prognoses! Just as an obstetrician knows by examining the placenta whether it has been completely expelled or whether noxious fragments of it still remain so we should be able independently of the success of the cure and the patient s present condition to say whether the work had been completely carried to an end or whether we had to expect relapses and fresh onsets of illness

(*b*) I will hasten on to the innovations in the field of technique where indeed nearly everything still awaits definitive settlement and much is only now beginning to come clear There are now two aims in psycho analytic technique to save the physician effort and to open up for the patient the freest access to his unconscious You know that our technique has been transformed in important respects At the time of the cathartic treatment we set ourselves the aim of elucidating the symptoms then we turned away from the symptoms to discovering the *complexes* to use Jung s indispensable word now however our work is aimed directly at finding out and overcoming the *resistances* and we can with justification rely on the complexes coming to light as soon as the resistances have been recognized and removed Some of you have since shown a desire to formulate and classify these resistances Now I beg you to examine your material and see whether you can confirm the following statement In male patients the most important resistances to the treatment seem to be derived from the father complex and to express themselves *in fear of the father and in defiance and incredulity towards him*

Other innovations in technique relate to the physician himself We have begun to consider the *counter transference* which arises in the physician as a result of the patient s influence on his unconscious feelings and have nearly come to the point of requiring the physician to recognize and overcome this counter transference in himself Now that a larger number of people have come to practise psycho-analysis and mutually exchange their experiences we have noticed that every analyst s achievement is limited by what his own complexes and resistances permit and consequently we require that he should begin his practice with a self analysis and should extend and deepen this constantly while making his observations on his patients Anyone who cannot succeed in this self analysis may without more ado regard himself as unable to treat neurotics by analysis

We are also now coming to the opinion that the analytic technique must undergo certain modifications according to the nature of the disease and the dominating instinctual trends in the patient Our therapy was in fact first designed for conversion hysteria in anxiety hysteria (phobias) we must alter our procedure to some extent The fact is that these patients cannot bring out the material necessary for resolving the phobia so long as they feel protected by retaining their phobic condition One cannot of course induce them to give up their protective measures and work under the influence of anxiety from the beginning of the treatment One must therefore help them by interpreting their unconscious to them until they can make up their minds to do without the protection of their phobia and expose themselves to a now comparatively moderate degree of anxiety Only when they have done so does the material necessary for achieving solution of

the phobia become access ble Other modifica tions of technique which seem to me not yet ready for discu s on will be equired in the tre tm t of obsess o al neuro is In this con necti n ery important quest ons arise which are n t yet el c dated how far the i stincts m ol ed n the co flict in the pat e t are to be allowed some gratificat on during the treat ment, and what diffe e ce t th n m l es wheth er these impul es re cti e (sadistic) o pas si (masochistic) n natu e

I h pe yo ha e r ce ed the mpre s n th t hen all that ca at present b m rely gl mpsed is known and when we ha e established all the impro eme ts i t chniqu t wh h deeper experi nce with our pat ents m st lead us then our med cal pra t e will r ach a d gree of precision and ce ta ty of succ ss which is not to be had i all m d cal specialties

But now to be sure I must damp the ardour f yo r expect ti ns The community will not hasten to grant a thority to s It s bound to offer es ta c to us for we adopt a critical att tude towards it we accuse it of pl yin a great part itself in c us g th neuroses Ju t as w m k anv s ngle pers n ur e emy by disc er g what s rep ssed in him, so the c mmun ty cann t re po d with sympathy to a r l ntl s expo ure f it injurious ffects and d ficienc be aus we destroy illus ns we are cused of ndangeri g deals It seems th f re th t th state of things fr m which I xpect ch great dvantages for our thera peut c result will never arrive And yet th t t on s not s h pel ss s on m ght think t th p es t t m Pow rf l though th fe l d the s lf intere t of men may be yet int llect is a powe too It has not, pe haps th power th t makes tself f lt imm di t ly but that s ll the m certa n in the end Th most mordant verities e hea d at last aft th inte ests they injure and the emoti ns

they rouse have exhausted their frenzy It has always been so and the unwelcome truths which we psycho analysts have to tell the world will undergo the same fate Only it will not come very quickly we must be able to wait

3 Finally I have to explain to you what I mean by the general effect of our work and how I come to set my hopes on it This consists in a very remarkable therapeutic constellation which could perhaps not be repeated anywhere else and which will appear strange to you too at first until you recognize in it something you have long been familiar with You know of course that the psychoneuroses are substitutive gratifications of instincts the existence of which one is forced to deny to oneself and others Their capacity to exist depends on this distortion and disguise When the riddle they hold is solved and the solution accepted by the sufferers these diseases will no longer be able to exist There is hardly anything quite like it in medicine in fairy tales you hear of evil spirits whose power is broken when you can tell them their names which they have kept secret

Now in place of a single sick person put the whole community of persons liable to neuroses persons ill and persons well in place of the acceptance of the solution in the first put a general recognition in the second and a little reflection will show you that this substitution cannot alter the result at all The success which the therapy has with individuals must appear in the many too Diseased people cannot let their various neuroses become known—their apprehensive overanxiousness which is to conceal their hatred their agoraphobia which betrays disappointed ambition their actions which represent self reproaches for evil intentions and precautions against them—when all their relatives and every stranger from whom they wish to conceal their thoughts and felings know the general meaning of these symptoms and when they themselves know that the manifestations of their disease produce nothing which others cannot instantly understand The affect however will not be merely that they will conceal their symptoms—a design by the way which would be impossible to execute for this concealment will destroy the purpose of the illness Disclosure of the secret will have attacked at its most sensitive point the *aetiological equation* from which the neuroses derive brought about by the indiscretions of physicians but an end of producing these illnesses.

If this hope seems utopian to you you may remember that certain neurotic phenomena have already been dispelled by this means although only in quite isolated instances Think how common hallucinations of the Virgin Mary were in peasant girls in former times So long as such a phenomenon brought a flock of believers and resulted perhaps in a chapel being built on the sacred spot the visionary state of these maidens was inaccessible to influence To-day even the priesthood has chan ed its attitude to such things it allows police and medical men to visit the seer and since then the Virgin appears very seldom Or allow me to study the same processes that I have been describing as taking place in the future in an analogous situation which is on a smaller scale and consequently more easily appreciated Suppose that a number of ladies and gentlemen in good society had planned a picnic at an inn in the forest one day The ladies make up their minds that if one of them wants to relieve a natural need she will say aloud that she i going to pick flowers but a wicked fellow hears of this secret and has printed on the programme which is sent round to the whole party— If the ladies wish to retire they are requested to say that they are going to pick flowers Of course after this no lady will think of availing herself of this flowery pretext and other freshly devised formulas of the same kind will be seriously compromised by it What will be the result? The ladies will own up to their natural needs without shame and none of the men will take exception to it Let us return to the erious aspect of our problem A number of people who find life s conflicts too difficult to solve have taken flight into neurosis and in this way won an unmistakable although in the end too costly advantage through illness What would these people have to do if their flight into illness were barred by the indiscreet revelations of psycho analysis? They would have to be honest own up to the instincts that are at work in them face the conflict fight for what they want or go without and the tolerance from the community which is bound to ensue as a result of psycho analytical knowledge would help them in their task

Let us remember however that it is not for us to advance upon life as fanatical hygienists or therapeutists We must admit that this ideal prevention of all neurotic illness would not be advantageous to every individual A good num

ber of those who now take flight into illness would not support the conflict under the conditions we have assumed but would rapidly succumb or would commit some outrage which would be worse than if they themselves fell ill of a neurosis. The neuroses have in fact their biological function as defensive measures and their social justification the *advantage through illness* that they provide is not always a purely subjective one. Is there one of you who has not at some time caught a glimpse behind the scenes in the causation of a neurosis and had to allow that it was the least of the evils possible in the circumstances? And should one really require such sacrifices in order to exterminate the neuroses while the world is all the same full of other inextinguishable miseries?

Should we therefore abandon our efforts to explain the hidden meaning of neurotic manifestations regarding it as dangerous to the individual and harmful to the interest of society should we give up drawing the practical conclusion from a piece of scientific insight? No I think that nevertheless our duty lies in the other direction. The *advantage through illness* provided by the neuroses is indeed on the whole and in the end detrimental to the individual as well as to society. The distress that our work of revelation may cause will affect but a few. The change to a more honest and honourable attitude in the world in general will not be bought too dearly by these sacrifices. But above all all the energies which are today consumed in the production of neurotic symptoms to serve the purposes of a world of phantasy out of touch with reality will even if they cannot at once be put to uses in life help to strengthen the outcry for those changes in our civilization from which alone we can hope for better things for our descendants.

I will let you go therefore with the assurance that you do your duty in more than one sense by treating your patients psycho-analytically. You are not merely working in the service of science by using the only and irreplaceable opportunity for discovering the secrets of the neuroses you are not only giving your patients the most efficacious remedy for their sufferings available at the present time but you are contributing your share to that enlightenment of the many from which we expect to gain the authority of the community in general and thus to achieve the most far reaching prophylaxis against neurotic disorders

Observations on "Wild" Psycho-Analysis[1]

A FEW days ago an elderly lady under the pro tection of a female friend called upon me for a consultation complaining of anxiety states She was in the second half of the forties fairly well preserved and had obviously not yet fin ished with her womanhood A divorce from her last husband had been the occasion exciting the anxiety states but the anxiety had become greatly intensified according to her account since she had consulted a young physician in the suburb she lived in for he had informed her that her sexual desires were the cause of her anxiety He said that she could not tolerate the loss of intercourse with her husband and so there were only three ways by which she could recover her health—she must either re turn to her husband or take a lover or satisfy herself Since then she had been convinced that she was incurable for she would not return to her husband and the other two alternatives were repugnant to her moral and religious feel ings She had come to me however because the doctor had said that I was responsible for this new opinion and that she had only to come and ask me to confirm what he said and I should tell her that this and nothing else was the truth The friend who was with her a still older pinched and unhealthy looking woman then implored me to assure the patient that the doc tor was mistaken It could not possibly be true for she herself had been a widow for many years and had remained respectable without suffering from anxiety

I will not dwell on the awkward predica ment in which I was placed by this visit but instead will consider the conduct of the prac titioner who sent this lady to me First how ever it will be as well to adopt a cautious atti tude which may possibly not be superfluous—indeed we will hope so Long experience has taught me—as it may others—not to accept straight away as true what patients especial ly nervous patients relate about their physi cian A neurologist not only easily becomes the object of many of the patient s hostile feelings whatever method of treatment he employs he must also sometimes resign himself to accept ing respon ibility by a kind of projection for the buried repressed wishes of his nervous patients That such accusations then nowhere find more credence than amon other physi cians is a melancholy but a significant circum stance

I have some grounds therefore for hoping that this lady gave me a tendenciously distorted account of what her physician had said and that I do a man who is unknown to me an in justice by connecting my remarks about 'wild psycho analysis with this incident But all the same by doing so I may perhaps prevent others from acting wrongly towards their patients

Let us suppose therefore that her medical practitioner spoke to the patient exactly as she reported of him Everyone will at once vouch safe the criticism that if a physician holds it necessary to discuss the question of sexuality with a woman he must do o with tact and consideration Compliance with this demand however coincides with carrying out certain of the *technical* regulations of psycho analysis moreover the physician in question was igno rant of a number of the *scientific* principles of psycho analysis or had misapprehended them and thus showed how little understanding of its nature and purposes he had in fact acquired.

We will begin with the second of these with his scientific errors His advice to the lady shows clearly in what sense he understands the expression *sexual life*—in the popular sense namely in which by sexual needs nothing is meant but the need for coitus or analogous acts producing orgasm and emission of sexual secre tions The physician cannot have been unaware however that psycho analysis is commonly re proached with having extended the connotation of the term *sexual* far beyond its usual range The fact is undisputed whether it may justly be used as a reproach shall not be discussed here In psycho analysis the term *sexuality* comprises far more it goes lower and also higher than the popular sense of the word This extension is justified genetically we reckon as belonging to *sexual life* all expressions of tender feeling which spring from the source of prim itive sexual feelings even when those feelings have become inhibited in regard to their orig inal sexual aim or have exchanged this aim for another which is no longer sexual For this rea son we prefer to speak of *psycho sexuality* thus laying stress on the point that the mental

[1] *Collected Pap* II first p bl hed *Z t L bl tt* Vol. 1 191 repr ted i *Samml g* D tte Folge.

factor should not be overlooked or under-esti mated. We use the word sex ty in the same comprehensive sense as tha in which the German language uses the word *lieben* (to love) And we have lon known that a mental lack of satisfaction with all consequences can exist where there is no lack of normal sexual intercourse as therapeutists too, we have constantly t remember that the unsatisfied sexual trends (the substitute satisfactions of which in the form f nervous symptoms we have to comba) can ften find onl very in adequate outlet in co us or other sexual cts

Anyone n t aware this psycho-anal tical point of view has no right to call to his aid psycho-anal tical theories c ncerned with the aetiological significance of sexuality By emphasizing exclusively th somatic factor in sexuality he certainl implifies the problem greatly but he alone must bear the responsibility f r what he does.

A second and equally gross misunderstanding is discernible behind the physician s advice

It is true that psycho-analysis puts forward lack f sexual satisf ction the cause of nervous disorders. B does o also go much further than this Is its teaching to be ignored as too complicated when it declares that nervous symptoms arise from a conflict between two forces—on the one hand, th libido (which is for the most part ressive) and on the other a too severe version from sexuality or a repression No one who remembers this second factor which is by no means sec dary in importance can ever believe that sexual satisf c tion in itself constitutes a remedy of general reliability for the sufferings f neurotics A good number f nervous persons are indeed, either in the ctual circumsta ces or al ogether in capa f satisfaction. If they were capa of it, if they were without their inner resistances, the strength f the instinct itself would point the wa t satisf ction f r them even though no ph cian re ommended it. What is the good, therefore advice such as that supposed to have been given t this lady by her physician?

Even if it could be justified scientifically it is not advice that s can carry out. If she had had no inner resistances against onanism or against liaison, she would f course have adop ed one f these measures long before Or does the physician think that woman over f rty has never heard f such thing as taking lover or does he overestimate his influence so much as t think that she could never decid upon such step without medical recommendation?

All this seems very simple and yet it must be admitted that there is one factor which often complicates the issue in forming a judgment. Some nervous sta es which we call the *actual* neuroses such as typical neurasthenia and pure forms of anxiety-neurosis, obviously depend on the physical f ctor in sexual life, and we have no certain knowledge of the part played in them by the mental factor and by repression. In such cases i is natural that the physician should first consider some *actual* therapy some alteration in the physical sexual way of life, and he does so with perfect justification if his diagnosis is correct. The lady who consulted the young physician complained chiefly of anxiety-states and so he probably assumed that she was suffering from an *anxiety-neurosis* and felt justified in recommending an actual therapy to her Again a convenient misapprehension! A person suffering from anxiety is not for that reason necessarily suffering from anxiety neurosis a diagnosis of cannot be based on its name one has to know what manifesta ons are comprised in an anxiety-neurosis and be able to distinguish it from other pathological

a

i

o

on who took into considerati n the possibility of anxiety-hysteria in this cas would have fallen into the error of neglecting the mental f ctors as this physician did with his three alternatives.

Oddly enough, the three therapeutic alternatives of this would be psycho-analyst leave no room for—psycho-analysis This woman can only be cured of her anxiety by returning to her husband, or by satisf ing her needs by onanism or with a lover And where does analytic treatment come in the treatment which we regard as th first remedy in anxiety sta es

This brings us to the *technical* errors to be remarked in the way that, according t our assumption, this physician proceeded. The idea that a neurotic is suffering from a sort f ignorance and that f one removes this ignorance by telling him f cts (about the causal connection of his illness with his life, about his experiences in childhood, and so on) h must recover is an idea that has long been superseded, and one derived from superficial appearances. The pathological f ctor is not his ignorance in

itself but the root of this ignorance in his *in ner resistances* it was they that first called this ignorance into being and they still maintain it now In combating these resistances lies the task of the therapy Telling the patient what he does not know because he has repressed it is only one of the necessary preliminaries in the therapy If knowledge about his uncon scious were as important for the patient as the inexperienced in psycho analysis imagine it would be sufficient to cure him for him to go to lectures or read books Such measures however have as little effect on the symptoms of nervous disease as distributing menu cards in time of famine has on people s hun er The analogy goes even further than its obvious ap plication too for describing his unconscious *to the patient is regularly followed* by intensifi cation of the conflict in him and exacerbation of his symptoms

Since however psycho analysis cannot dis pense with making this disclosure to patients it prescribes that two conditions are to be fulfilled before it is done First by preparatory work the repressed material must have come very near to the patient s thoughts and secondly he must be sufficiently firmly attached by an affective relationship to the physician (trans ference) to make it impossible for him to take fresh flight again

Only when these two conditions are fulfilled is it possible to recognize and to overcome the resistances which have led to the repression and the ignorance Psycho analytic measures therefore cannot possibly dispense with a fair ly long period of contact with the patient and attempts to bully the patient during his first consultation by brusquely telling him the hid den things one infers behind his story are tech nically reprehensible they mostly lead to their own doom too by inspiring in the patient a hearty dislike for the physician and putting an end to any further influence

Besides all this one may sometimes make a false inference and one is never in a position to discover the whole truth In psycho analysis these exact technical precautions take the place of a vague demand implying a peculiar talent for medical tact

It is not enough therefore for a physician to know a little of what psycho analysis has discovered he must also have familiarized himself with its technique if he wishes his med ical practice to be guided by a psycho analytic point of view This technique is even today not to be learnt from books and it is certainly not to be discovered independently without great sacrifices of time labour and success It is to be learnt like other medical measures from those who are already proficient in it In form ing a judgment on the incident that I took as a starting point for these remarks therefore it is a matter of some significance that I do not know the physician who is said to have given the lady such advice and have never be fore heard his name

Neither for myself nor for my friends and co workers is it pleasant to claim in this way a monopoly in the use of psycho analytic tech nique But in face of the danger to patients and to the cause of psycho analysis which one foresees in this wild psycho analysis we have no other choice In the spring of 1910 we founded an International Psycho Analytical As sociation in which the members admit their participation by allowing publication of their names in order to be able to repudiate respon sibility for what is done by those who do not belong to us and yet call their methods psycho analysis For as a matter of fact wild ana lysts of this kind do more harm to the cause of psycho analysis than to individual patients I have often found that a clumsy feat of a sim ilar kind led to good results in the end although it first produced an exacerbation of the pa tient s condition Not always but still often When he has abused the physician enough and feels impervious enough to any further influ ence of the kind his symptoms give way or he decides to take some step leading to re covery The final improvement then comes of itself or is ascribed to some entirely harmless treatment by another physician to whom the patient turned afterwards In the case of the lady whose complaint against her doctor we have heard I should say that in spite of all the wild psycho analyst did more for her than some highly respected authority who might have told her she was suffering from a *vaso-motor neurosis* He did force her attention to the real cause of her trouble or in that direc tion and in spite of all her struggles that can not be without some favourable results But he has done himself harm and helped to inten sify the prejudices which patients feel owing to their natural resistances against the ways of psycho analysts And this can be avoided.

Om ted in bseq t editions.

psychological doctrines The attitude of the scientific reviewers was such as to lead me to expect that the fate of the book would be to fall into oblivion and the little flock of faithful adherents who follow my lead in the therapeutic application of psycho analysis and interpret dreams by my method could not have exhausted the first edition of this book I feel therefore that my thanks are due to the wider circle of cultured and inquiring readers whose sympathy has induced me after the lapse of nine years once more to take up this difficult work which has so many fundamental bearings

I am glad to be able to say that I found little in the book that called for alteration Here and there I have interpolated fresh material or have added opinions based on more extensive experience or I have sought to elaborate individual points but the essential passages treating of dreams and their interpretation and the psychological doctrines to be deduced therefrom have been left unaltered subjectively at all events they have stood the test of time Those who are acquainted with my other writings (on the aetiology and mechanism of the psychoneuroses) will know that I never offer unfinished work as finished and that I have always endeavoured to revise my conclusions in accordance with my maturing opinions but as regards the subject of the dream life I am able to stand by my original text In my many years work upon the problems of the neuroses I have often hesitated and I have often gone astray and then it was always the interpretation of dreams that restored my self confidence My many scientific opponents are actuated by a wise instinct when they decline to follow me into the region of oneirology

Even the material of this book even my own dreams defaced by time or superseded by means of which I have demonstrated the rules of dream interpretation revealed when I came to revise these pages a continuity that resisted revision For me of course this book has an additional subjective significance which I did not understand until after its completion It reveals itself to me as a piece of my self analysis as my reaction to the death of my father that is to the most important event the most poignant loss in a man s life Once I had realized this I felt that I could not obliterate the traces of this influence But to my readers the material from which they learn to evaluate and interpret dreams will be a matter of indifference

Where an inevitable comment could not be fitted into the old context I have indicated by square brackets that it does not occur in the first edition

Berchtesgaden 1908

INTRODUCTORY NOTE

IN this volume I have attempted to expound the methods and results of dream interpretation and in so doing I do not think I have overstepped the boundary of neuro pathological science For the dream proves on psychological investigation to be the first of a series of abnormal psychic formations a series whose succeeding members—the hysterical phobias the obsessions the delusions—must for practical reasons claim the attention of the physician The dream as we shall see has no title to such practical importance but for that very reason its theoretical value as a typical formation is all the greater and the physician who cannot explain the origin of dream images will strive in vain to understand the phobias and the obsessive and delusional ideas or to influence them by therapeutic methods

But the very context to which our subject owes its importance must be held responsible for the deficiencies of the following chapters The abundant lacunae in this exposition represent so many points of contact at which the problem of dream formation is linked up with the more comprehensive problems of psychopathology problems which cannot be treated in these pages but which if time and powers suffice and if further material presents itself may be elaborated elsewhere

The peculiar nature of the material employed to exemplify the interpretation of dreams has made the writing even of this treatise a difficult task Consideration of the methods of dream interpretation will show why the dreams recorded in the literature on the subject or those collected by persons unknown to me were useless for my purpose I had only the choice between my own dreams and those of the patients whom I was treating by psychoanalytic methods But this later material was inadmissible since the dream processes were undesirably complicated by the intervention of neurotic characters And if I relate my own dreams I must inevitably reveal to the gaze of strangers more of the intimacies of my psychic life than is agreeable to me and more than seems fitting in a writer who is not a poet but a scientific investigator To do so is painful but unavoidable I have submitted to the necessity for otherwise I could not have

quite sli htly warm) which led him to conclude that dreams might easily betray to the physician the first indications of an incipient physical change which escaped observation during the day

As has been said those writers of antiquity who preceded Aristotle did not regard the dream as a product of the dreaming psyche but as an inspiration of divine origin and in ancient times the two opposing tendencies which we shall find throu hout the ages in respect of the evaluation of the dream life were already perceptible The ancients distinguished between the true and valuable dreams which were sent to the dreamer as warnin s or to foretell future events and the vain fraudulent and empty dreams who e object was to misguide him or lead him to destruction

Gruppe speaks of such a classification of dreams citing Macrobius and Artemidorus Dreams were divided into two classes the first class was believed to be influenced only by the present (or the past) and was unimportant in respect of the future it included the ενυκνια (*insomnia*) which directly reproduce a given idea or its opposite e g hun er or its satiation and the φαντασματα which elaborate the given idea phantastically as e g the nightmare *ephialtes* The econd class of dreams on the other hand was determinative of the future To this belonged

1 Direct prophecies received in the dream (χρηματισμός oraculum)
2 the foretelling of a future event (ὅραμα visio)
3 the symbolic dream which requires interpretation (ονειρος somnium)

This theory survived for many centuries

Connected with these varying estimations of the dream was the problem of dream interpretation Dreams in general were expected to yield important solutions but not every dream was immediately understood and it was impossible to be sure that a certain incomprehensible dream did not really foretell something of importance so that an effort was made to replace the incomprehensible content of the dream by somethin that should be at once comprehensible and significant In later antiquity Artemidorus of Daldis was regarded as the greatest authority on dream interpretation His comprehensive works must serve to compensate us for the lost works of a similar nature The pre scientific conception of the dream which obtained among the ancients was of course in perfect keeping with their general conception of the universe which was accustomed to project as an external reality that which posses ed reality only in the life of the psyche Further it accounted for the main impression made upon the waking life by the morning memory of the dream for in this memory the dream as compared with the rest of the psychic content seems to be something alien coming as it were from another world It would be an error to suppose that theory of the supernatural origin of dreams lacks followers even in our own times for quite apart from pietistic and mystical writers—who cling as they are perfectly justified in doing to the remnants of the once predominant realm of the supernatural until these remnants have been swept away by scientific explanation—we not infrequently find that quite intelli ent persons who in other respects are averse from anything of a romantic nature go so far as to base their religious belief in the existence and co operation of superhuman spiritual powers on the inexplicable nature of the phenomena of dreams (Haffner) The validity ascribed to the dream life by certain schools of philosophy—for example by the school of Schelling—is a distinct reminiscence of the undisputed belief in the divinity of dreams which prevailed in antiquity and for some thinkers the mantic or prophetic power of dreams is still a subject of debate This is due to the fact that the explanations attempted by psychology are too inadequate to cope with the accumulated material however strongly the scientific thinker may feel that such superstitious doctrines should be repudiated

To write a history of our scientific knowledge of the dream problem is extremely difficult because valuable though this knowled e may be in certain respects no real progress in a definite direction is as yet discernible No

real foundation of verified results has hitherto been established on which future investigators might continue to build. Every new author approaches the same problems afresh, and from the very beginning. If I were to enumerate each the various contributions of the authors, giving a survey of the opinions which each has held concerning the problems of the dream, I should be quite unable to draw a clear and complete picture of the present state of our knowledge on the subject. I have therefore preferred to base my method of treatment on themes rather than on authors, and in attempting the solution of each problem of the dream I shall cite the material found in the literature of the subject.

But as I have not succeeded in mastering the whole of this literature—for it is widely dispersed, and interwoven with the literature of other subjects—I must ask my readers to rest content with my survey as it stands, provided that no fundamental fact or important point of view has been overlooked.

Until recently most authors have been inclined to deal with the subjects of sleep and dreams in conjunction, and together with these they have commonly dealt with analogous conditions of psycho-pathological nature and other dream-like phenomena, such as hallucinations, visions, etc. In recent works, on the other hand, there has been a tendency to keep more closely to the theme and to consider as a special subject the separate problems of the dream-life. In this change I should like to perceive an expression of the growing conviction that enlightenment and agreement in such obscure matters may be attained only by a series of detailed investigations. Such a detailed investigation, and one of a special psychological nature, is expounded in these pages. I have had little occasion to concern myself with the problem of sleep, as this is essentially a physiological problem, although the changes in the functional determination of the psychic apparatus should be included in a description of the sleeping state. The literature of sleep will therefore not be considered here.

A scientific interest in the phenomena of dreams as such leads us to propound the following problems, which to a certain extent, are interdependent on one another:

A. *The Relation of the Dream to the Waking State*

The naive judgment of the dreamer on waking assumes that the dream—even if it does not come from another world—has at all events transported the dreamer into another world. The old physiologist Burdach, to whom we are indebted for a careful and discriminating description of the phenomena of dreams, expressed this conviction in a frequently quoted passage (p. 474): "The waking life with its trials and joys, its pleasures and pains, is never repeated; on the contrary, the dream aims at relieving us of these. Even when our whole mind is filled with one subject, when our hearts are rent by bitter grief, or when some task has been taxing our mental capacity to the utmost, the dream either gives us something entirely alien, or it selects for its combinations only a few elements of reality, or it merely enters into the key of our mood, and symbolizes real things." J. H. Fichte (I, 541) speaks in precisely the same sense of supplementary dreams, and calls them one of the secret, self-healing benefits of the psyche. L. Strümpell expresses himself to the same effect in his *Natur und Entstehung der Träume*, a study which is deservedly held in high esteem: "He who dreams turns his back upon the world of waking consciousness" (p. 16). "In the dream the memory of the orderly content of waking consciousness and its normal behaviour is almost entirely lost" (p.). "The almost complete and unencumbered isolation of the psyche in the dream from the regular normal content and course of the waking state ..." (p. 19).

Yet the overwhelming majority of writers on the subject have adopted the contrary view of the relation of the dream to waking life. Thus Haffner (p. 19): "To begin with, the dream continues the waking life. Our dreams always connect themselves with such ideas as have shortly before been present in our consciousness. Careful examination will nearly always detect a thread by which the dream has linked itself to the experiences of the previous day." Weygandt (p. 6) flatly contradicts the statement of Burdach. "For it may often be observed, apparently, indeed, in the great majority of dreams, that they lead us directly back to everyday life, instead of releasing us from it." Maury (p. 56) expresses the same idea in a concise formula: "*Nous rêvons de ce que nous avons vu, dit, désiré ou fait.*"* Jessen in his *Psychologie* published in 18 (p.) is rather more explicit: "The content of dreams is always more or less determined by the per

* We dream of what we have seen, said, desired, or done.—Ed.

sonality the age ex station in life education and habits and by the events and experiences of the whole past life of the individual

The philosopher I G E Maas adopts the most unequivocal attitude in respect of this question (*Uber die Leidenschaften* 1805) Experience corroborates our assertion that we dream most frequently of those things toward which our warmest passions are directed This shows us that our passions must influence the generation of our dreams The ambitious man dreams of the laurels which he has won (perhaps only in imagination) or has still to win while the lover occupies himself in his dreams with the object of his dearest hopes All the sen ual desires and loathings which lumber in the heart if they are stimulated by any cause may combine with other ideas and give rise to a dream or these ideas may mingle in an already existing dream

The ancients entertained the same idea concerning the dependence of the dream content on life I will quote Radestock (p 139) When Xerxes before his expedition again t Greece was dissuaded from his re olution by good counsel but was again and again incited by dreams to undertake it one of the old rational dream interpreters of the Persians Artabanus told him and very appropriately that dream images for the most part contain that of which one has been thinking in the waking state

In the didactic poem of Lucretius *On the Nature of Things* (IV 962) there occurs this passage

Et quo quisque fere studio dei ctus adhaeret aut qi bus n rebus multum sumus ante mo ati atque ea ratio e fu t co te ta magis me s i somn s eadem ple umque videmu ob causi dici causas agere et compone e leges duperatores pugna e ac p o l a ob e etc etc

Cicero (*De Divinatione* II LXVII) says in a similar strain as does also Maury many centuries later *Maximeque reliquiae rerum earum moventur in animis et agitantur de quibus vigilantes aut cogitavimus aut egimus*

The contradiction between these two views concerning the relation between dream life and waking life seems indeed irresolvable Here we may usefully cite the opinion of F W Hildebrandt (1875) who held that on the whole the peculiarities of the dream can only be described as a series of contrasts which apparently amount to contradictions (p 8) The first of these contrasts is formed by the *strict isolation or seclusion* of the dream from true and actual life on the one hand and on the other hand by the continuous encroachment of the one upon the other and the constant dependence of the one upon the other The dream is something absolutely divorced from the reality experienced during the waking state one may call it an existence hermetically sealed up and insulated from real life by an unbridgeable [illegible]

fundamentally has nothing in common with real life Hildebrandt then asserts that in falling asleep our whole being with its forms of existence disappears as through an invisible trapdoor In one s dream one is perhaps making a voyage to St Helena in order to offer the imprisoned Napoleon an exquisite vintage of Moselle One is most affably received by the ex-emperor and one feels almost sorry when on waking the interesting illusion is destroyed But let us now compare the situation existing in the dream with the actual reality The dreamer has never been a wine merchant and has no desire to become one He has never made a sea voyage and St Helena is the last place in the world that he would choose as the destination of such a voya e The dreamer feels no sympathy for Napoleon but on the contrary a strong patriotic aver ion And lastly the dreamer was not yet among the living when Napoleon died on the island of St Helena so that it was beyond the realms of possibility that he should have had any personal relations with Napoleon The dream experience thus appears as *something entirely foreign interpolated* between two mutually related and successive periods of time

Nevertheless continues Hildebrandt the apparent contrary is just as true and correct I believe that side by side with this seclusion and insulation there may still exi t the most intimate interrelation We may therefore justly say Whatever the dream may offer us it derives its material from reality and from the psychic life centered upon th s reality However extraordinary the dream may seem it can never detach itself from the real world and its

stat as be g part of n knowledg an ex pen ce One remembers clearly e ugh hav ing dream d of the thing in q estion, but e cannot recall the act al experience or the time of its occurrence The dream r is therefore in the d k as to th sou e which the dream has tapped and is ev tempted to bel e e in an independ t prod cti acti ty on the part of th dream until, ften l g afterw rds a fresh episode e t s th m m ry of that f rmer e pen c which had been gi en up for lost and so reveals the sourc f the dream. On th re fore f rced t dmit that in th dream some thi g was kn wn and rem mbered that cannot be rem mbered in the waking state

Delbœuf relates f m his own experience an especially impress e example of this ki d He saw in hi dream th ourtyard of hi h use covered with snow and f und the e tw l ttle lizards half froze and b ried in the snow Be ing l e of animal he p ked them up warm d them and put them back into the hole i the wall which was reserved especially for them He al.o ga e them a few fronds of a l t tl fern which was growing on the wall and of whi h he knew they were very fond. In the dream he knew the name of the plant *Asplen um ruta muralis* The dream cont nued return ing after a di re sion to the lizards and to his aston shment Delbœuf saw two other little liz a ds fall ng upon what was left of the ferns On turning his eyes to the open fields he saw a fifth and a sixth lizard making for the hole in the wall and finally the whole road was covered by a proces on of l zards all wandering in the same directio

In his waking state Delbœuf knew only a few Latin ames of plants and nothing of a y *As plen m* To his great surprise he discovered that a fern of this name did actually exist and that the c rrect name was *Asplem m ruta mu aria* whi h th dream had slightly distorted An acc dental c incidence was of co rse incon cei able yet where he got his knowledge of the name *Asplen. m* in the dream remained a mystery to him

The dream occurred in 1862 Sixteen years late while at the house of one of his friends the philos pher noticed a small album contain ing dri d plants such as are sold as souvenirs to vis tors in ma y parts of Sw tze la d A sud den recollect on came to him he opened the h barium discovered therein the *Asplem m* of his d eam and recognized his own hand writing in the acc mp yi Latin name The connect on could n w be traced In 1860 two ye rs befo e th d te of the lizard dream one of his frie d s sisters while on her wedding jo rney had paid a vis t to Delbœuf She had with h r at the time this very album whi h was inte ded for her broth r and Delbœuf had tak the trouble to write at the dictation of a botani t the Latin name under each of the dried plants.

The same good fortune which gave this ex ample ts unusual val e enabled Delbœuf t trace yet anoth r portion f this d eam t ts f rg tt n s e One day in 1877 he came upon an old l me of an illustrated periodical in which he f und the whole proces on of lizards p ctured just as he had dre mt of it in 862 Th volume b re the date 1861 and Delbœuf rem mbered that he had subscribed to the jour nal since it first ppearan e.

That dreams ha e at th r dispo.al recolle tions which are ina c ss'ble to the waking tate s su h em kabl d th etically impor tant f t that I sh uld like t draw attenti n

to the point by recording yet other *hypermnesic* dreams Maury relates that for some time the word *Mussidan* used to occur to him during the day He knew it to be the name of a French city but that was all One night he dreamed of a conversation with a certain person who told him that she came from Mussidan and in answer to his question as to where the city was she replied Mussidan is the principal town of a district in the department of Dordogne On waking Maury gave no credence to the information received in his dream but the gazetteer showed it to be perfectly correct In this case the superior knowledge of the dreamer was confirmed but it was not possible to trace the forgotten source of this knowledge

Jessen (p 55) refers to a very similar incident the period of which is more remote Among others we may here mention the dream of the elder Scaliger (Hennings l c p 300) who wrote a poem in praise of the famous men of Verona and to whom a man named Brugnolus appeared in a dream complaining that he had been neglected Though Scaliger could not remember that he had heard of the man he wrote some verses in his honour and his son learned subsequently that a certain Brugnolus had at one time been famed in Verona as a critic.

A hypermnesic dream especially remarkable for the fact that a memory not at first recalled was afterwards recognized in a dream which followed the first is narrated by the Marquis d Hervey de St Denis I once dreamed of a young woman with fair golden hair whom I saw chatting with my sister as she showed her a piece of embroidery In my dream she seemed familiar to me I thought indeed that I had seen her repeatedly After waking her face was still quite vividly before me but I was absolutely unable to recognize it I fell asleep again the dream picture repeated itself In this new dream I addressed the golden haired lady and asked her whether I had not had the pleasure of meeting her somewhere Of course she replied don t you remember the bathing place at Pornic? Thereupon I awoke and I was then able to recall with certainty and in detail the incidents with which this charming dream face was connected

The same author recorded that a musician of his acquaintance once heard in a dream a melody which was absolutely new to him Not until many years later did he find it in an old collection of musical compositions though still he could not remember ever having seen it before

I believe that Myers has published a whole collection of such hypermnesic dreams in the *Proceedings of the Society for Psychical Research* but these unfortunately are inaccessible to me I think everyone who occupies himself with dreams will recognize as a very common phenomenon the fact that a dream will give proof of the knowledge and recollection of matters of which the dreamer in his waking state did not imagine himself to be cognizant In my analytic investigations of nervous patients of which I shall speak later I find that it happens many times every week that I am able to convince them from their dreams that they are perfectly well acquainted with quotations obscene expressions etc and make use of them in their dreams although they have forgotten them in their waking state I shall here cite an innocent example of dream hypermnesia because it was easy to trace the source of the knowledge which was accessible only in the dream

A patient dreamed amongst other things (in a rather long dream) that he ordered a *kontus ówka* in a cafe and after telling me this he asked me what it could be as he had never heard the name before I was able to tell him that *kontus ówka* was a Polish liqueur which he could not have invented in his dream as the name had long been familiar to me from the advertisements At first the patient would not believe me but some days later after he had allowed his dream of the cafe to become a reality he noticed the name on a signboard at a street corner which for some months he had been passing at least twice a day

I have learned from my own dreams how largely the discovery of the origin of individual dream-elements may be dependent on chance Thus for some years before I had thought of writing this book I was haunted by the picture of a church tower of fairly simple construction which I could not remember ever having seen I then suddenly recognized it with absolute certainty at a small station between Salzburg and Reichenhall This was in the late nineties and the first time I had travelled over this route was in 1886 In later years when I was already busily engaged in the study of dreams I was quite annoyed by the frequent recurrence of the dream image of a certain peculiar locality I saw in definite orientation to my own person—on my left—a dark space in

waking state has quite recently excited them?

We can readily understand how the strange preference shown by the dream memory for the indifferent and therefore disregarded details of daily experience must commonly lead us altogether to overlook the dependence of dreams on the waking state or must at least make it difficult for us to prove this dependence in any individual case. Thus it happened that in the statistical treatment of her own and her friend's dream, Miss Whiton Calkins found that 11 per cent of the entire number showed no relation to the waking state. Hildebrandt was certainly correct in his assertion that all our dream images could be genetically explained if we devoted enough time and material to the tracing of their origin. To be sure, he calls this "a most tedious and thankless job. For most often it would lead us to ferret out all sorts of psychically worthless things from the remotest corners of our storehouse of memory, and to bring to light all sorts of quite indifferent events of long ago from the oblivion which may have overtaken them an hour after their occurrence." I must, however, express my regret that this discerning author refrained from following the path which at first seemed so unpromising, for it would have led him directly to the central point of the explanation of dreams.

The behaviour of memory in dreams is surely most significant for any theory of memory whatever. It teaches us that "nothing which we have once psychically possessed is ever entirely lost" (Scholz, p. 34); or as Delbœuf puts it, *"que toute impression même la plus insignifiante laisse une trace inaltérable indéfiniment susceptible de reparaître au jour"*,[1] a conclusion to which we are urged by so many other pathological manifestations of mental life. Let us bear in mind this extraordinary capacity of the memory in dreams in order the more keenly to realize the contradiction which has to be put forward in certain dream theories to be mentioned later, which seek to explain the absurdities and incoherences of dreams by a partial forgetting of what we have known during the day.

It might even occur to one to reduce the phenomenon of dreaming to that of remembering, and to regard the dream as the manifestation of a reproductive activity unresting even at night, which is an end in itself. This would seem to be in agreement with statements such as those made by Pilcz, according to which definite relations between the time of dreaming and the contents of a dream may be demonstrated, inasmuch as the impressions reproduced by the dream in deep sleep belong to the remote past, while those produced towards morning are of recent origin. But such a conception is rendered improbable from the outset by the manner in which the dream deals with the material to be remembered. Strümpell rightly calls our attention to the fact that repetitions of experiences do not occur in dreams. It is true that a dream will make a beginning in that direction, but the next link is wanting; it appears in a different form, or is replaced by something entirely novel. The dream gives us only fragments of reproductions; this is so far the rule that it permits of a theoretical generalization. Still there are exceptions in which an episode is repeated in a dream as completely as it can be reproduced by our waking memory. Delbœuf relates of one of his university colleagues that in a dream he repeated in all its details a perilous drive in which he escaped accident as if by a miracle. Miss Calkins mentions two dreams, the contents of which exactly reproduced an experience of the previous day, and in a later chapter I shall have occasion to give an example that came to my knowledge of a childish experience which recurred unchanged in a dream.[2]

C. Dream Stimuli and Sources

What is meant by dream stimuli and dream sources may be explained by reference to the popular saying, "Dreams come from the stomach." This notion covers a theory which conceives the dream as resulting from a disturbance of sleep. We should not have dreamed if some disturbing element had not come into play during our sleep, and the dream is the reaction against this disturbance.

The discussion of the exciting causes of dreams occupies a great deal of space in the literature of dreams. It is obvious that this problem could have made its appearance only after dreams had become an object of biological investigation. The ancients, who conceived of dreams as divine inspiration, had no need

[1] That every impression, even the most insignificant, leaves an ineradicable mark, indefinitely capable of reappearing by day.—Ed.

[2] From subsequent experience I am able to state that it is not at all rare to find in dreams reproductions of unimportant occupations of everyday life, such as packing trunks, preparing food in the kitchen, etc., but in such dreams the dreamer himself emphasizes not the character of the recollection, but its "reality"—"I really did this during the day."

distinct but his features were blended with those of one of my schoolmasters whom I still meet from time to time What association there was between the two persons I could not discover on waking but upon questioning my mother concerning the doctor I learned that he was a one eyed man The schoolmaster whose image in my dream obscured that of the physician had also only one eye I had not seen the doctor for thirty-eight years and as far as I know I had never thought of him in my waking state although a scar on my chin might have reminded me of his professional attentions

As though to counterbalance the excessive part which is played in our dreams by the impressions of childhood many authors assert that the majority of dreams reveal elements drawn from our most recent experiences Robert (p 46) even declares that the normal dream generally occupies itself only with the impressions of the last few days We shall find indeed that the theory of the dream advanced by Robert absolutely requires that our oldest impressions should be thrust into the background and our most recent ones brought to the fore However the fact here stated by Robert is correct this I can confirm from my own investigations Nelson an American author holds that the impressions received in a dream most frequently date from the second day before the dream or from the third day before it as though the impressions of the day immediately preceding the dream were not sufficiently weakened and remote

Many authors who are unwilling to question the intimate connection between the dream content and the waking state have been struck by the fact that the impressions which have intensely occupied the waking mind appear in dreams only after they have been to some extent removed from the mental activities of the day Thus as a rule we do not dream of a beloved person who is dead while we are still overwhelmed with sorrow (Delage) Yet Miss Hallam one of the most recent observers has collected examples which reveal the very opposite behaviour in this respect and upholds the claims of psychological individuality in this matter

The third most remarkable and at the same time most incomprehensible peculiarity of memory in dreams is shown in the selection of the material reproduced for here it is not as in the waking state only the most significant things that are held to be worth remembering but also the most indifferent and insignificant details In this connection I will quote those authors who have expressed their surprise in the most emphatic language

Hildebrandt (p 11) For it is a remarkable fact that dreams do not as a rule take their elements from important and far reaching events or from the intense and urgent interests of the preceding day but from unimportant incidents from the worthless odds and ends of recent experience or of the remoter past. The most shocking death in our family the impressions of which keep us awake long into the night is obliterated from our memories until the first moment of waking brings it back to us with distressing force On the other hand the wart on the forehead of a passing stranger to whom we did not give a moment s thought once he was out of sight finds a place in our dreams

Strumpell (p 39) speaks of cases in which the analysis of a dream brings to light elements which although derived from the experiences of yesterday or the day before yesterday were yet so unimportant and worthless for the waking state that they were forgotten soon after they were experienced Some experiences may be the chance heard remarks of other persons or their superficially observed actions or fleeting perceptions of things or persons or isolated phrases that we have read etc

Havelock Ellis (p 727) The profound emotions of waking life the questions and problems on which we spend our chief voluntary mental energy are not those which usually present themselves at once to dream consciousness It is so far as the immediate past is concerned mostly the trifling the incidental the forgotten impressions of daily life which reappear in our dreams The psychic activities that are awake most intensely are those that sleep most profoundly

It is precisely in connection with these characteristics of memory in dreams that Binz (p 45) finds occasion to express dissatisfaction with the explanations of dreams which he himself had favoured And the normal dream raises similar questions Why do we not always dream of mental impressions of the day before instead of going back without any perceptible reason to the almost forgotten past now lying far behind us? Why in a dream does consciousness so often revive the impression of indifferent memory pictures while the cerebral cells that bear the most sensitive records of experience remain for the most part inert and numb unless an acute revival during the

actually fallen on to the floo Gregory relates that h o ce appl d a hot water bottle to his feet and dreamed of taking a trip to the summit of Mount Etna where he f und the heat of th il almo t unbearable After ha m bl te appli d to his h ad another man d eamed of being calped by I d ans st ll an othe whose hirt was damp dreamed th t he was dragged through a tream An att ck of gout c sed patient t b h e that he was in the hand of the I quisitio d uffering the pains of tort (Macnish)

to look for stimuli for them a dream was due to the will of divine or demonic powers and its content was the product of their special knowledge and intention Science however immediately raised the question whether the stimuli *of dreams were single or multiple and this* in turn led to the consideration whether the causal explanation of dreams belonged to the region of psychology or to that of physiology Most authors appear *to assume that disturb*ance of sleep and hence dreams may arise from various causes and that physical as well as mental stimuli may play the part of dream excitants Opinions differ widely in preferring this or the other factor as the cause of dreams and in classifying them in the order of importance

Whenever the sources of dreams are completely enumerated they fall into the following four categories which have also been employed in the classification of dreams (1) external *(objective) sensory stimuli (2) internal (sub*jective) sensory stimuli (3) internal (organic) physical stimuli (4) purely psychical sources of excitation

1 *External sensory stimuli*

The younger Strumpell the son of the philosopher whose work on dreams has already more than once served us as a guide in considering the problems of dreams has as is well known recorded his observations of a patient afflicted with general anaesthesia of the skin and with paralysis of several of the higher sensory organs This man would laps into sleep whenever the few remaining sensory paths between him*self and the outer world were closed* When we wish to fall asleep we are accustomed to strive for a condition similar to that obtaining in Strumpell s experiment We close the most important sensory portals the eyes and we endeavour to protect the other senses from all stimuli or from any change of the stimuli already acting upon them We then fall asleep although our preparations are never wholly successful For we can never completely insulate the sensory organs nor can we entirely abolish the excitability of the sensory organs themselves That we may at any time be awakened by intenser stimuli should prove to us that the mind has *remained in constant communica*tion with the external world even during sleep The sensory stimuli that reach us during sleep may easily become the source of dreams

There are a *great many* stimuli of this nature ranging from those unavoidable stimuli which are proper to the state of sleep or occasionally admitted by it to those fortuitous stimuli which are calculated to wake the sleeper Thus a strong light may fall upon the eyes a noise may be heard or an odour may irritate the mucous membranes of the nose In our unintentional movements durin sleep we may lay bare parts of the body and thus expose them to a sensation of cold or by a change of *position we may excite sensations* of pressure and touch A mosquito may bite us or a slight nocturnal mischance may simultaneously attack more than one sense organ Observers have called attention to a whole series of dreams in which the stimulus ascertained on waking and some part of the dream content corresponded to such a degree that the stimulus could be recognized as the source of the dream

I shall here cite a number of such dreams collected by Jessen (p 527) which are traceable to more or less accidental objective sen*sory stimuli Every noise indistinctly perceived* gives rise to corresponding dream representations the rolling of thunder takes us into the thick of battle the crowing of a cock may be transformed into human shrieks of terror and the creaking of a door may conjure up dreams of burglars breaking into the house When one of our blankets slips off us at night we may dream that we are walking about naked or falling into water If we lie diagonally across the bed with our feet extendin beyond the edge we may dream of standing on the brink of a terrifying precipice or of falling from a great height Should our head accidentally get under the pillow we may imagine a huge rock overhanging us and about to crush us under its weight An accumulation of semen produces voluptuous dreams and local pains give rise to ideas of suffering ill treatment of hostile attacks or of accidental bodily injuries

Meier (*Versuch einer Erklarung des Nachtwandelns* Halle 1758 p 33) once dreamed of being attacked by several men who threw him flat on the ground and drove a stake into the earth between his first and second toes While imagining this in his dream he suddenly awoke and felt a piece of straw sticking between his toes The same author according to Hemmings (*Von den Traumen und Nachtwandlern* Weimar 1784 p 58) dreamed on another occasion when his nightshirt was rather too tight round his neck that he was being hanged In his youth Hoffbauer dreamed of having fallen from a high wall and found on waking that the bedstead had come apart and that he had

actually fallen on to the floor. Gregory relates that he once applied a hot water bottle to his feet and dreamed of taking a trip to the summit of Mount Etna, where he found the heat of the soil almost unbearable. After having a blister applied to his head, another man dreamed of being scalped by Indians; still another whose shirt was damp dreamed that he was dragged through a stream. An attack of gout caused a patient to believe that he was in the hands of the Inquisition, and suffering the pains of torture (Macnish).

The argument that there is a resemblance between the dream stimulus and the dream content would be confirmed if by a systematic induction of stimuli we should succeed in producing dreams corresponding to these stimuli. According to Macnish such experiments had already been made by Girou de Buzareingues. He left his knee exposed and dreamed of travelling on a mail-coach by night. He remarked in this connection that travellers were well aware how cold the knees become in a coach at night. On another occasion he left the back of his head uncovered and dreamed that he was taking part in a religious ceremony in the open air. In the country where he lived it was customary to keep the head always covered except on occasions of this kind.

Maury reports fresh observations on self-induced dreams of his own. (A number of the experiments were unsuccessful.)

1 He was tickled with a feather on his lips and on the tip of his nose. He dreamed of an awful torture; that a mask of pitch was stuck to his face and then forcibly torn off, bringing the skin with it.

2 Scissors were whetted against a pair of tweezers. He heard bells ringing, then sounds of tumult which took him back to the days of the Revolution of 1848.

3 Eau de Cologne was held to his nostrils. He found himself in Cairo in the shop of Johann Maria Farina. This was followed by fantastic adventures which he was not able to recall.

4 His neck was lightly pinched. He dreamed that a blister was being applied and thought of a doctor who had treated him in childhood.

5 A hot iron was brought near his face. He dreamed that *chauffeurs*[1] had broken into the house and were forcing the occupants to give up their money by thrusting their feet into braziers. The Duchess d'Abrantès, whose secretary he imagined himself to be, then entered the room.

6 A drop of water was allowed to fall on to his forehead. He imagined himself in Italy perspiring heavily and drinking the white wine of Orvieto.

7 When the light of a candle screened with red paper was allowed to fall on his face, he dreamed of thunder, of heat, and of a storm at sea which he once witnessed in the English Channel.

Hervey, Weygandt and others have made attempts to produce dreams experimentally.

Many have observed the striking skill of the dream in interweaving into its structure sudden impressions from the outer world in such a manner as to represent a gradually approaching catastrophe (Hildebrandt). "In former years," this author relates, "I occasionally made use of an alarm-clock in order to wake punctually at a certain hour in the morning. It probably happened hundreds of times that the sound of this instrument fitted into an apparently very long and connected dream, as though the entire dream had been especially designed for it, as though it found in this sound its appropriate and logically indispensable climax, its inevitable denouement."

I shall presently have occasion to cite three of these alarm-clock dreams in a different connection.

Volkelt (p. 68) relates: "A composer once dreamed that he was teaching a class and was just explaining something to his pupils. When he had finished he turned to one of the boys with the question: 'Did you understand me?' The boy cried out like one possessed: 'Oh ja!' ... for ... in the street."

Garnier (*Traité des facultés de l'âme*, 1865) on the authority of Radestock relates that Napoleon I while sleeping in a carriage was awakened from a dream by an explosion which took him back to the crossing of the Tagliamento and the bombardment of the Austrians, so that he started crying: "We have been undermined."

—

some terrible scenes of murder, and finally he himself was summoned before the Tribunal.

[1] Chauffeurs were bands of robbers in the Vendée who resorted to this form of torture.

There he saw Robespierre Marat Fouquier Tinville and all the sorry heroes of those terrible day he had to give an account of him

which did was sen enormous

crowd he was led to the place of execution He mounted the scaffold the executioner tied him *to the plank it tipped over and the knife of the* guillotine fell He felt his head severed from his trunk and awakened in terrible anxiety only to find that the head board of the bed had *fallen* and had *actually* struck the cervical vertebrae just where the knife of the guillotine would have fallen

This dream gave rise to an interesting discussion initiated by Le Lorrain and Egger in *the Revue Philosophique as to whether and* how it was possible for the dreamer to crowd

stimuli occurring in sleep are among the most *firmly* established of all the sources of dreams they are indeed the only stimuli of which the layman knows anything whatever If we ask an educated person who is not familiar with the literature of dreams how dreams originate he is certain to reply by a reference to a case known to him in which a dream has been explained after waking by a recognized objective stimulus Science however cannot stop here but is incited to further investigation by the observation that the stimulus influencing the senses during sleep does not appear in the dream at all in its true form but is replaced by *some other representation* which is in some way related to it But the relation existing between the stimulus and the resulting dream is according to Maury *une affinité quelconque mais qui n est pas unique et exclusive* (p 72) If we read for example three of Hildebrandt s alarm clock dreams we shall be compelled to ask why the same casual stimulus evoked so *many different results* and why just these results and no others

(P 37) I am taking a walk on a beautiful spring morning I stroll through the green meadows to a neighbouring village where I see numbers of the inhabitants going to church wearing their best clothes and carrying their hymn books under their arms I remember that it is Sunday and that the morning service will soon begin I decide to attend it but as I am rather overheated I think I will wait in the churchyard until I am cooler While reading the various epitaphs I hear the sexton climbing the church tower and I see above me the small bell which is about to ring for the beginning of service For a little while it hangs *motionless then it* begins to swing and suddenly its notes resound so clearly and penetratingly that my sleep comes to an end But the notes of the bell come from the alarm clock

A second combination It is a bright winter day the streets are deep in snow I have promised to go on a sleigh ride but I have to wait some time before I am told that the sleigh is at *the door Now I am preparing to get into the* sleigh I put on my furs the foot warmer is put in and at last I have taken my seat But still my departure is delayed At last the reins are *twitched* the horses start and the sleigh bells now violently shaken strike up their familiar music with a force that instantly tears the gossamer of my dream Again it is only the shrill note of my alarm clock

Yet a third example I see the kitchen maid walking along the passage to the dining room with a pile of several dozen plates The porcelain column in her arms seems to me *to be in* danger of losing its equilibrium Take care I exclaim you will drop the whole pile! The usual retort is naturally made—that she is used to such things etc Meanwhile I continue *to* follow her with my anxious gaze and behold at the threshold the fragile plates fall and crash and roll across the floor in hundreds of pieces But I soon perceive that the endless din is not really a rattling but a true ringing and with this ringing the dreamer now becomes aware that the alarm clock has done its duty

The question why the dreaming mind misjudges the nature of the objective sensory stimulus has been answered by Strumpell and in an almost identical fashion by Wundt their

d to ind en

sory impression is recognized by us and correctly *interpreted—that is it is classed with* the memory group to which it belongs according to all previous experience if the impression is strong clear and sufficiently prolonged and if we have sufficient time to submit it to those mental processes But if these conditions are not fulfilled we mistake the object which gives

A t f r lat wh h is h w ther n q e or e clus e—ED

rise to the impression, and on the basis of this impression we construct an illusion. If one takes a walk in an open field and perceives distinctly a distant object, it may happen that one will at first take it for a horse. On closer inspection the image of a cow resting may obtrude itself, and the picture may finally resolve itself with certainty into a group of people sitting on the ground. The impressions which the mind receives during sleep from external stimuli are of a similarly indistinct nature; they give rise to illusions because the impression evokes a greater or lesser number of memory images through which it acquires its psychic value. As for the question, in which of the many possible spheres of memory the corresponding images are aroused, and which of the possible associative connections are brought into play, that—to quote Strumpell again—is indeterminable, and is left, as it were, to the caprices of the mind.

Here we may take our choice. We may admit that the laws of dream-formation cannot really be traced any further, and so refrain from asking whether or not the interpretation of the illusion evoked by the sensory impression depends upon still other conditions; or we may assume that the objective sensory stimulation encroaching upon sleep plays only a modest rôle as dream-source, and that other factors determine the choice of the memory image to be evoked. Indeed, on carefully examining Maury's experimentally produced dreams, which I have purposely cited in detail, one is inclined to object that his investigation traces the origin of only one element of the dreams, and that the rest of the dream-content seems too independent and too full of detail to be explained by a single requirement, namely, that it must correspond with the element experimentally introduced. Indeed, one even begins to doubt the illusion theory, and the power of objective impressions to shape the dream, when one realizes that such impressions are sometimes subjected to the most peculiar and far-fetched interpretations in our dreams. Thus M. Simon tells of a dream in which he saw persons of gigantic stature seated at table, and heard distinctly the horrible clattering produced by the impact of their jaws as they chewed their food. On waking he heard the clatter of a horse's hooves as it galloped past his window. If in this case the sound of the horse's hooves had revived ideas from the memory-sphere of *Gulliver's Travels*, the sojourn with the giants of Brobdingnag, and the virtuous horse-like creatures—as I should perhaps interpret the dream without any assistance on the author's part—ought not the choice of a memory sphere so alien to the stimulus to be further elucidated by other motives?

Gigantic persons in a dream justify the assumption that the dream deals with a scene from the dreamer's childhood. This interpretation of the dream as a reminiscence of *Gulliver's Travels* is by the way a good example of how interpretation should not be made. The dream-interpreter should not permit his own intelligence to operate in disregard of the dreamer's impressions.

2. Internal (subjective) sensory stimuli

All objections to the contrary notwithstanding, we must admit that the rôle of the objective sensory stimuli as producers of dreams has been indisputably established, and if, having regard to their nature and their frequency, these stimuli seem perhaps insufficient to explain all dream pictures, this indicates that we should look for other dream sources which act in a similar fashion. I do not know where the idea first arose that together with the external sensory stimuli the internal (subjective) stimuli should also be considered, but as a matter of fact this has been done more or less explicitly in all the more recent descriptions of the aetiology of dreams. I believe, says Wundt (p. 363), that an important part is played in dream illusions by those subjective sensations of sight and hearing which are familiar to us in the waking state as a luminous chaos in the dark field of the vision, and a ringing, buzzing

etc. Here the luminous dust in the dark field of vision has assumed fantastic forms, and the many luminous points of which it consists are embodied in our dreams in as many single images, which, owing to the mobility of the luminous chaos, are seen as moving objects. This is perhaps the reason of the dream's decided preference for the most varied animal forms, for owing to the multiplicity of such forms they can readily adapt themselves to the subjective luminous image.

The subjective sensory stimuli as a source of dream have the obvious advantage that, unlike objective stimuli, they are independent of external accidents. They are, so to speak, at the disposal of the interpretation whenever they are required. But they are inferior to the

objective sensory stimuli by the fact that their claim to the role of dream inciters—which observation and experiment have established in the case of objective stimuli—can in their case be verified with difficulty or not at all The main proof of the dream inciting power of subjective sensory stimuli is afforded by the so called hypnogogic hallucinations which have been described by Johann Muller as phantastic visual manifestations They are those very vivid and changeable pictures which with many people occur constantly during the period of falling asleep and which may linger for a while even after the eyes have been opened Maury who was very subject to these pictures made a thorough study of them and maintained that they were related to or rather identical with dream images This had already been asserted by Johann Muller Maury maintains that a certain psychic passivity is necessary for their origin that it requires a relaxation of the intensity of attention (p 59) But one may perceive a hypnogogic hallucination in any frame of mind if one falls into such a lethargy for a moment after which one may perhaps wake up until this oft repeated process terminates in sleep According to Maury if one wakes up shortly after such an experience it is often possible to trace in the dream the images which one has perceived before falling asleep as hypnogogic hallucinations (p 134) Thus Maury on one occasion saw a series of images of grotesque figures with distorted features and curiously dressed hair which obtruded themselves upon him with incredible importunity during the period of falling asleep and which upon waking he recalled having seen in his dream On another occasion while suffering from hunger because he was subjecting himself to a rather strict diet he saw in one of his hypnogogic states a plate and a hand armed with a fork taking some food from the plate In his dream he found himself at a table abundantly supplied with food and heard the clatter of the diners forks On yet another occasion after falling asleep with strained and painful eyes he had a hypnogogic hallucination of microscopically small characters which he was able to decipher one by one only with a great effort and on waking from sleep an hour later he recalled a dream in which there was an open book with very small letters which he was obliged to read through with laborious effort

Not only pictures but auditory hallucinations of words names etc may also occur hypnogogically and then repeat themselves in the dream like an overture announcing the principal motif of the opera which is to follow

A more recent observer of hypnogogic hallucinations G Trumbull Ladd follows the same lines as Johann Muller and Maury By dint of practice he succeeded in acquiring the faculty of suddenly arousing himself without opening his eyes two to five minutes after gradually falling asleep This enabled him to compare the disappearing retinal sensations with the dream images remaining in his memory He assures us that an intimate relation between the two can always be recognized inasmuch as the luminous dots and lines of light spontaneously perceived by the retina produce so to speak the outline or scheme of the psychically perceived dream images For example a dream in which he saw before him clearly printed lines which he read and studied corresponded with a number of luminous spots arranged in parallel lines or to express it in his own words The clearly printed page resolved itself into an object which appeared to his waking perception like part of an actual printed page seen through a small hole in a sheet of paper but at a distance too great to permit of its being read Without in any way underestimating the central element of the phenomenon Ladd believes that hardly any visual dream occurs in our minds that is not based on material furnished by this internal condition of retinal irritability This is particularly true of dreams which occur shortly after fallin asleep in a dark room while dreams occurring in the morning near the period of waking receive their stimulus from the objective light penetrating the eye in a brightly lit room The shifting and infinitely variable character of the spontaneous luminous excitations of the retina exactly corresponds with the fitful succession of images presented to us in our dreams If we attach any importance to Ladd s observations we cannot underrate the productiveness of this subjective source of stimuli for visual images as we know are the principal constituents of our dreams The share contributed by the other senses excepting perhaps the sense of hearing is relatively insignificant and inconstant

3 *Internal (organic) physical stimuli*

If we are disposed to look for the sources of dreams not outside but inside the organism we must remember that almost all our internal organs which in a state of health hardly remind us of their existence may in states of excitation—as we call them—or in disease become

a source of the most painful sensation and must therefore be put on a par with the exter ... ts of pain and sensation. Strumpell, ... f miliar

ms sat and it s c mpelled ... be influenced by certain stimulatin mpres ons originating in parts of the body and in alter ations f the body of which t is uncon cious m the waking tate. Even Aristotle declares r to be quit possib e that a dream may draw our attention to incipient morb d co d tions which we ha e n n ticed in the waking tate (own t the exaggerated intensity of the im pres ns experienced in the dream and some medical auth rs wh certainl did n t believe m t prophetic nature of dreams ha e ad m ted the significance of dreams at least in so far the predicting of disease is concerned. [Cf M Simon, p. 31 and many earlier writ rs[1]])

E en m ur days there seems to be no lack of a thenticated examples of such diagnostic chievements on th part f dreams. Thus Tis cites from Artigues (*Essai sur la valeur ... logiq e d s R v*) the history of wom an of forty-three who during several years of parently perfect health, was troub ed with nxiet -dreams and in whom a medical exam na o subsequently revealed an incipient af fecti f the heart, to which sh presently succumbed.

Serious derangements of the int rnal organs clearl excit dreams in quite numbe of per sons. Th freq ency of nxiety-dreams in dis eases of th heart and lungs has been generally realized indeed, this functi of the dream h s mphasized by so many wri ers that I shall here content myself with a reference to the li erature of the subject (Rade tock, Spitta Maury M Simon Tiss) Tissié even believes that the d seased organs impress upon the dream-conte t its characterist c fea tures. The dream of persons uffering from diseases of the heart are generally ery brief and end in a terrified awakenin death under terribl circum tances almost always find a place n their o t t Those uffering from di eases of the lungs dream of suffocation of being crushed, and of flight and a great many of them are subj ct to the familiar nightmare —which by the wa Borner has succeeded in inducin erimentall by lying on the face and co eri g the mouth and nostrils In diges- ti e di tu bances the dream contains ideas from the sphere of gustatory enjoyment and disgust. Finally the influence of sexual excite ment on the dream-content is ob ous enough in every e s experience and pro des the tronge t confirmation of the whole theory of dream instigation by rganic ensation

Moreo er if we tudy th literature of dreams it becomes quite ev dent that some writers (M ury Weygandt) ha e been led to the udy of dream problems by the influence the r own pathological tat has had on the conte t of their dreams.

The enlargement of the number of dream urces by such undeniabl t blished f cts is, however not so important s one might be led to uppose f dreams are fter all, phenom ena which occur in health persons—pe haps in all persons and every night—and a patho- logical tat of th organs is evidently n t one of the indispensable cond t ons For u h w ever th que tio is not whe ce particular dreams originat but rather what is the excit in cause of ordinary dreams in normal peopl ?

But we ha e only to go a tep farthe t find ource of dreams which i m re prolific than any of those mentioned above and which promises indeed t be inexhaustible. If it is es- tablished that th bodily rgan become in sick es , n exciti source of dreams and if we admit that the mind, when diverted during sleep from the outer wo ld, can devote more of i s ten on to the int ri of the body we may readily assume that the organs need n t n cessarily become diseased in rder to permit stimuli which in one way another grow into dream images, t reach th sleeping mind. What in the waking tat w vaguel perceive as general sensation, perceptibl by its quali ty alone—a sensation to which, in the opinion

Cf bove, p 37

1 addition to the diagnostic value on f dreams (e g by Hippocrates) mention mus lso be made f their therapeutic significance in antiquity

Among the Greeks there were dream oracles, which were vouchsafed patients quest f recovery The pa e be ook himse f the templ f Apollo or Aesculapius there he was subjected to various cere- monies bathed, rubbed nd perf med. A sta e f ex tation having been thus induced, he was made to l down in the tem on the ski f sacrificial ram. of physicians all the organic systems contribute their share—this general sensation would at night attain a greater potency and acting through its individual components would constitute the most prolific as well as the most usual source of dream representations We should then have to discover the laws by which organic stimuli are translated into dream representations

This theory of the origin of dreams is the one most favoured by all medical writers The obscurity which conceals the essence of our being—the *moi splanchnique* as Tissie terms it—from our knowledge and the obscurity of the origin of dreams correspond so closely that it was inevitable that they should be brought into relation with one another The theory according to which the organic sensations are responsible for dreams has moreover another attraction for the physician inasmuch as it favours the aetiological union of the dream with mental derangement both of which reveal so many points of agreement in their manifestations since changes in the general organic massive sensation and in the stimuli emanating from the internal organs are also considered to have a far reaching significance as regards the origin of the psychoses It is therefore not surprising that the organic stimulus theory can be traced to several writers who have propounded this theory independently

A number of writers have followed the train of thought developed by Schopenhauer in 1851 Our conception of the universe has its origin in the recasting by the intellect of the impressions which reach it from without in the moulds of time space and causality During the day the stimuli proceeding from the interior of the organism from the sympathetic nervous system exert at most an unconscious influence on our mood At night however when the overwhelming effect of the impressions of the day is no longer operative the impressions that surge upward from within are able to force them elves on our attention—just as in the night we hear the rippling of the brook that was drowned in the clamour of the day But how else can the intellect react to these stimuli than by transforming them in accordance with its own function into things which occupy pace and time and follow the lines of causality?—and so a dream originates Thus Scherner and after him Volkelt endeavoured to discover the more intimate relations between physical sensations and dream pictures but we shall reserve the discussion of this point for our chapter on the theory of dreams

As a result of a singularly logical analysis the psychiatrist Krauss referred the origin of dreams and also of deliria and delusions to the same element namely to organically determined sensations According to him there is hardly any part of the organism which might not become the starting point of a dream or a delusion Organically determined sensations he says may be divided into two classes (1) general sensations—those affecting the whole system (2) specific sensations—those that are immanent in the principal systems of the vegetative organism and which may in turn be subdivided into five groups (*a*) the muscular (*b*) the pneumatic (*c*) the gastric (*d*) the sexual (*e*) the peripheral sensations (p 33 of the second article)

The origin of the dream image from physical sensations is conceived by Krauss as follows The awakened sensation in accordance with some law of association evokes an idea or image bearing some relation to it and combines with this idea or image forming an organic structure towards which however the consciousness does not maintain its normal attitude For it does not bestow any attention on the sensation but concerns itself entirely with the accompanyin ideas and this explains why the facts of the case have been so long misunderstood (p 11 ff) Krauss even gives this process the special name of transubstantiation of the sensations into dream images (p 4)

The influence of organic physical stimuli on the formation of dreams is today almost universally admitted but the question as to the nature of the law underlying this relation is answered in various ways and often obscurely On the basis of the theory of physical excitation the special task of dream interpretation is to trace back the content of a dream to the causative organic stimulus and if we do not accept the rules of interpretation advanced by Scherner we shall often find ourselves confronted by the awkward fact that the organic source of excitation reveals itself only in the content of the dream

A certain a reement however appears in the interpretation of the various forms of dreams which have been designated as typical because they recur in so many persons with almost the same content Among these are the well known dreams of falling from a height of the dropping out of teeth of flying and of embarrassment because one is naked or scantily clad This last type of dream is said to be

caused simply by the dreamer's percept on felt in his leep that he has thrown off the bed clothes and i u cove d The dream that o e s teeth are d opping o t is explained by de tal irritat which does n t however of neces ity imply a mo b d c nditi n of irritability in the teeth. Ac rdin t Strumpell the flying dream is the ad qu te image employed by the mind to i terpr t th quantum of timulus ema and nking of the pulmo-

4. *Psych c sources of e c tation*

When cons derin the relation of dreams to waking life and the p o enan e of the ma terial of dream we learn d that the earliest as well a the mo t ece t invest gators ar agreed that men dream of what they do during the d y and of th thi gs that i te est them in the w king t te This inte est co t ued f om wakin, life into leep is not only a psychic b nd, j ining th d eam to lif but it s lso a sou ce of dreams who e importance must not be und rest m ted and which, taken t gether w th those st m li which become act e and of inte est d ring leep suffices to explain the ori gi of all dream images Yet we have also heard the ry co trary of th a erted n m ly that d am b ar the sl epe away fr m th inter ts f the d y and that in most ca es we do not d m f thi g which h e occup ed r attenti n d ring th day until aft r they ha e lost f o waking lif th stimul tin f ce of bel nging to the p esent H nce n the analy sis f dre m life we are rem d d at every tep that t is in dmi sible t frame general rules w th ut making p vis n f qualificat on by introd ci g such term as f eque tly as a

See below f f rthe d cu f th w l mes f records t dreams since p blished by this writer

rule in most cases and without being prepared to admit the validity of exceptions

If interest during the waking state together with the internal and external stimuli that occur during sleep sufficed to cover the whole aetiology of dreams we should be in a position to give a satisfactory account of the origin of all the elements of a dream *the problem of* the dream sources would then be solved leaving us only the task of discriminating between *the part played by the psychic and that played* by the somatic dream stimuli in individual dreams But as a matter of fact no such com*plete solution of a dream has ever been achieved* in any case and everyone who has attempted such a solution has found that components of *the dream—and usually a great many of them —are left whose source he is unable to trace* The interests of the day as a psychic source of *dreams are obviously not so influential as to* justify the confident assertion that every dreamer continues the activities of his waking *life in his dreams*

Other dream sources of a psychic nature are not known Hence with the exception perhaps *of the explanation of dreams given by Scherner* to which reference will be made later on all the explanations found in the literature of the sub*ject show a considerable hiatus whenever there* is a question of tracing the images and ideas which are the most characteristic material of *dreams In this dilemma the majority of au*thors have developed a tendency to belittle as far as possible the share of the psychic factor *which is so difficult to determine in the evoca*tion of dreams To be sure they distinguish as major divisions the nerve stimulus dream and *the association dream and assert that the latter* has its source exclusively in reproduction (Wundt p 365) but they cannot dismiss the *doubt as to whether they appear without any* impulsion from organic stimuli (Volkelt p 127) And even the characteristic quality of the pure association dream disappears To quote Volkelt (p 118) In the association dream proper there is no longer any question of such a stable nucleus Here the loose grouping penetrates even to the very centre of the dream The imaginative life already released from the control of reason and intellect is here no longer held together by the more important psychical and physical stimuli *but is left to its own un*controlled and confused divagations Wundt too attempts to belittle the psychic factor in the evocation of dreams by asserting that the phantasms of the dream are perhaps unjustly impressions which are never extin uished during sleep (p *359 et seq*) Weygandt has adopted this view and generalizes upon it He asserts that the most immediate cau es of all *dream representations* are sensory stimuli to which reproductive associations then attach themselves (p 17) Tissié goes still further *in suppressing the psychic sources of excita*tion (p 183) *Les reves d origine absolument psychique n existent pas'* [1] and elsewhere (p 6) *Les pensées de nos reves nous viennent de dehors*

Those writers who like the eminent philosopher Wundt adopt a middle course do not hesitate to assert that in most dreams there is a cooperation of the somatic stimuli and psychic stimuli which are either unknown or are identified with the interests of the day

We shall learn later that the problem of dream formation may be solved by the disclosure of an entirely unsuspected psychic source of excitation In the meanwhile we shall not be surprised at the over estimation of the influence of those stimuli which do not originate in the psychic life It is not merely because they alone may easily be found and even confirmed by experiment but because the somatic conception of the origin of dreams entirely corresponds with the mode of thou ht prevalent in modern psychiatry Here it is true the mastery of the brain over the organism is most emphatically stressed but everything that might show that the psychic life is independent of demonstrable organic changes or spontaneous in its manifestations *is alarm*ing to the contemporary psychiatrist as thou h such an admission must mean a return to the old world *natural philosophy and the meta*physical conception of the nature of the oul The distrust of the psychiatrist has placed the *psyche under tutelage so to speak it requires* that none of the impulses of the psyche shall reveal an autonomous power Yet this attitude *merely betrays a lack of confidence in the sta*bility of the causal concatenation between the physical and the psychic Even where on investigation the psychic may be recognized as the primary cause of a phenomenon a more profound comprehension of the subject will one

D m *d* ot *t wh se ig is totally* psy h —E

da succeed in following up the path that leads to the organic basis of the psychic. But where the psychic must, in the present state of our knowledge be accepted as the terminus, it need not on that account be disallowed.

D Why Dreams Are Forgotten After Waking

That a dream *fades away in the morning* is proverbial. It is, indeed, possible to recall it. For we know the dream, of course, only by recalling it after waking but we very often believe that we remember it incompletely that during the night there was more of it than we remember. We may observe how the memory of a dream which in the morning was still vivid fades in the course of the day leaving only a few trifling remnants. We are often aware that we have been dreaming but we do not know of what we have dreamed and we rem

dreaming even when, in the morning, we know nothing either of the content of the dream or of the fact that we have dreamed. On the other hand, it often happens that dreams manifest an extraordinary power of maintaining themselves in the memory. I have had occasion to analyse, with my patients, dreams which occurred to them twenty five years or more previously and I can remember a dream of my own which is divided from the present day by at least thirty-seven years and yet has lost nothing of its freshness in my memory. All this is very remarkable and for the present incomprehensible.

The forgetting of dreams is treated in the most detailed manner by Strumpell. This forgetting is evidently a complex phenomenon for Strumpell attributes it not to a single cause, but to quite a number of causes.

In the first place, all those factors which induce forgetfulness in the waking state determine also the forgetting of dreams. In the waking state we commonly very soon forget a great many sensations and perceptions because they are too slight to remember and because [illegible] arged with only a slight amount of feeling. This is true also of many [illegible] they are forgotten because they [illegible]ak, while the stronger images in their [illegible]ood are remembered. However the [illegible] intensity is in itself not the only d[illegible] of the preservation of dream images [illegible], as well as other [illegible]tors (Calkins) [illegible]t dream images are often rapidly for

gotten although they are known to have been vivid, while among those that are retained in the memory there are many that are very shadowy and unmeaning. Besides in the waking state one is wont to forget rather easily things that have happened only once and to remember more readily things which occur repeatedly. But most dream images are unique experiences and this peculiarity would contribute toward the forgetting of all dreams equally. Of much greater significance is a third cause of forgetting. In order that feelings, representations, ideas and the like should attain a certain degree of memorability it is important that they should not remain isolated but that they should enter into connections and associations of an appropriate nature. If the words of a verse of poetry are taken and mixed together it will be very difficult to remember them [illegible] sequence on

retained with just as much difficulty and just as rarely as things that are confused and disorderly. Now dreams in most cases lack sense and order. Dream-compositions by their very nature are insusceptible of being remembered and they are forgotten because as a rule they fall to pieces the very next moment. To be sure, these conclusions are not entirely consistent with Radestock's *observation (p 165) that we most readily retain just those dreams which are most peculiar*.

According to Strumpell, other factors derived *from the relation of the dream to the waking state* are even more effective in causing *us to forget our dreams. The forgetfulness of dreams manifested by the waking consciousness is evidently merely* the counterpart of the fact already mentioned, namely that the dream hardly ever takes over an orderly series of memories from the waking state but only certain details of these memories which it removes from the habitual psychic connections in which they are remembered in the waking state. The dream-composition therefore has [no] place in the community of the psychic series which fill the mind. It lacks all mnemonic aids. In this manner the dream-structure rises as it were from the soil of our psychic life, and floats in psychic space like a cloud in the sky quickly dispelled by the first breath of re-

Periodically recurrent dreams have been observed repeatedly. Compare the collection made by Chabaneix.

awakening life (p 87) This situation is ac centuated by the fact that on waking the attention is immediately besieged by the in rushing world of sensation so that very few dream images are capable of withstanding its force They fade away before the impressions of the new day like the stars before the light of the sun

Finally we should remember that the fact that most people take but little interest in their dreams is conducive to the forgetting of dreams Anyone who for some time applies himself to the investi ation of dreams and takes a special interest in them usually dreams more during that period than at any other he remembers his dreams more easily and more frequently

Two other reasons for the forgetting of *dreams which Bonatelli (cited by Benini) adds* to those adduced by Strumpell have already been included in those enumerated above namely (1) that the difference of the general sensation in the sleeping and the waking state is unfavourable to mutual reproduction and (2) that the different arrangement of the ma terial in the dream makes the dream untrans latable so to peak for the waking conscious ness

It is therefore all the more remarkable as *Strumpell him elf observes that in spite of all* these reasons for forgetting the dream so many dreams are retained in the memory The contin ual efforts of those who have written on the subject to formulate laws for the remember ing of dreams amount to an admission that here too there is something puzzling and un explained Certain peculiarities relating to the remembering of dreams have attracted partic ular attention of late for example the fact that the dream which is believed to be for gotten in the morning may be recalled in the course of the day on the occasion of some per ception which accidentally touches the for gotten content of the dream (Radestock Tissie) *But the whole recollection of dreams* is open to an objection which is calculated greatly to depreciate its value in critical eyes One may doubt whether our memory which omits so much from the dream does not falsify what it retains

This doubt as to the exactness of the repro duction of dreams is expressed by Strumpell when he ays It may therefore easily hap pen that the waking consciousness involuntar ily interpolates a great many thin s in the rec ollection of the dream one imagines that one has dreamt all sorts of things which the actual dream did not contain

Je sen (p 547) expresses himself in very de cided terms Moreover we must not lose si ht of the fact hitherto little heeded that in the investigation and interpretation of coherent and logical dreams we almost always take lib erties with the truth when we recall a dream to memory Unconsciously and unintentionally we fill up the gaps and supplement the dream im ages Rarely and perhaps never has a con nected dream been as connected as it appears to us in memory Even the most truth loving person can hardly relate a dream without ex aggerating and embellishing it in some degree The human mind so greatly tends to perceive *everything in a connected form that it inten* tionally supplies the missin links in any dream which is in some de ree incoherent

The observations of V Egger though of course independently conceived read almost like a translation of Jessen s words

L observation des reves a ses difficultés spéciales et le seul moyen d eviter toute erreur en pareille matière est de confier au papier sans le moind e retard ce que l on vient d éprouver et de remarquer sinon l oubli vient vite ou total ou partiel l oubli total est sans gravité mais l oubli partiel est perfide car si l on se met ensuite à raconter ce que l on n a pas oublié on est exposé à compléter par imagina tion les fragments incohérents et disjoints four ni par la mémoire on devient artiste à son insu et le récit périodiquement répété s impose à la créance de son auteur qui de bonne foi le présente comme un fait authentique dument établi selon les bonnes methodes [n]

Similarly Spitta who seems to think that it is only in the attempt to reproduce the dream that we bring order and arrangement into loose ly associated dream elements— turning juxta position into concatenation that is adding the process of logical connection which is absent in the dream

Since we can test the reliability of our mem

ory only by objective means, and since such a test is impossible in the case of dreams, which are our own personal experience and for which we know no other source than our memory what value do our recollections of our dreams possess?

E. *The Psychological Peculiarities of Dreams*

In our scientific investigation of dreams we start with the assumption that dreams are a phenomenon of our own psychic activity yet the completed dream appears to us as something alien, whose authorship we are so little inclined to recognize that we should be just as willing to say A dream came to me as "I dreamed. Whence this 'psychic strangeness of dreams According to our exposition of the sources of dreams, we must assume that it is determined by the material which finds its way into the dream-content, since this is for the most part common both to dream-life and waking life We might ask ourselves whether this impression is not evoked by modifications of the psychic processes in dreams and we might even attempt to suggest that the existence of such changes is the psychological characteristic of dreams.

No one has more strongly emphasized the essential difference between dream life and waking life and drawn more far reaching conclusions from this difference than G. Th. Fechner in certain observations contained in his *Element der Psychophysik* (Part II p 520) He believes that "neither the simple depression of conscious psychic life under the main threshold, nor the distraction of the attention from the influences of the outer world suffices to explain the peculiarities of dream-life as compared with waking life He believes rather that the arena of dreams is other than the arena of the waking life of the mind. If the arena of psychophysical activity were the same during the sleeping and the waking state the dream, in my opinion, could only be a continuation of the waking ideational life at a lower degree of intensity so that it would have to partake of the form and material of the latter But this is by no means the case"

What Fechner really meant by such a transposition of the psychic activity has never been made clear nor has anybody else to my knowledge followed the path which he indicates in this remark. An anatomical interpretation in the sense of physiological localization in the brain or even a histological stratification of the cerebral cortex, must of course be excluded. The idea might, however prove ingenious and fruitful if it could refer to a psychical apparatus built up of a number of successive and connected systems

Other authors have been content to give prominence to this or that palpable psychological peculiarity of the dream life and even to take this as a starting-point for more comprehensive attempts at explanation

It has been justly remarked that one of the chief peculiarities of dream-life makes its appearance even in the state of falling asleep and may be defined as the sleep-heralding phenomenon According to Schleiermacher (p 351) the distinguishing characteristic of the waking state is the fact that its psychic activity occurs in the form of ideas rather than in that of images. But the dream thinks mainly in visual images and it may be noted that with the approach of sleep the voluntary activities become impeded in proportion as involuntary representations make their appearance the latter belonging entirely to the category of images *The incapacity for such ideational activities as we feel to be deliberately willed and the emergence of visual images which is regularly connected with this distraction—these are two constant characteristics of dreams, and on psychological analysis we are compelled to recognize them as essential characteristics of dream life. As for the images themselves—the hypnogogic hallucinations—we have learned that even in their content they are identical with dream images*

Dreams, then think preponderantly but not exclusively in visual images They make use

simply thought or imagined (probably with the help of remnants of verbal conceptions) Characteristic of dreams, however are only those elements of their contents which behave like images that is which more closely resemble perceptions than mnemonic representations Without entering upon a discussion of the nature of hallucinations—a discussion familiar to every psychiatrist—we may say with every well informed authority that the dream hallucinates —that is that it replaces thoughts by hallucinations. In this respect visual and acoustic im

pressions behave in the same way It has been observed that the recollection of a succession of notes heard as we are falling asleep becomes transformed when we have fallen asleep into a hallucination of the same melody to give place each time we wake to the fainter and qualitatively different representations of the *memory and resumin each time we doze off* again its hallucinatory character

The transformation of an idea into a hallu cination is not the only departure of the dream from the more or less corresponding waking thou ht From these images the dream creates a situation it represents something as actually present it dramatizes an idea as Spitta (p 145) puts it But the peculiar character of this *aspect of the dream life is completely intelli gible only if we admit that in dreaming we do* not as a rule(the exceptions call for special ex amination) suppose ourselves to be thinking but actually experiencin, that is we accept the hallucination in perfectly good faith The criticism that one has experienced nothing but that one has merely been thinking in a peculiar manner—dreaming—occurs to us only on wak

The characteristics of the dream life thus far considered have been summed up by Burdach (p 476) as follows As characteristic features of the dream we may state (*a*) that the sub jective activity of our psyche appears as objec tive inasmuch as our perceptive faculties ap prehend *the products of phantasy as though* they were sensory activities (*b*) that sleep abrogates our voluntary action hence falling asleep involves a certain degree of passivity

The images of sleep are conditioned by the relaxation of our powers of will

It now remains to account for the credulity of the mind in respect to *the dream hallucina* tions which are able to make their appearance *only* after the suspension of certain voluntary powers Strumpell asserts that in this respect the psyche behaves correctly and in conform ity with its mechanism The dream-elements are by no means mere representations but true and actual experiences of the psyche *similar* to those which come to the waking state by way of the senses (p 34) Whereas in the waking *state the* mind thinks and imagines by means of verbal images and language in dreams it thinks and imagines in actual perceptual images (p 35) Dreams moreover reveal a spatial con sciousness inasmuch as in dreams just as in the waking state sen ations and images are transposed into outer space (p 36) It must therefore be admitted that in dreams the mind preserves the same attitude in respect of im ages and perceptions as in the waking state (p 43) And if it forms erroneous conclusions in respect of these images and perceptions this *is due to the fact that in sleep it is deprived of* that criterion which alone can distinguish be tween sensory perceptions emanating from within and those coming from without It is un able to subject its images to those tests which alone can prove their objective reality Fur ther it neglects to differentiate between those images which can be exchanged at will and those in respect of which there is no free choice *It errs because it cannot apply the law of cau sality to the content of its dreams (p 58)* In brief its alienation from the outer world is the very reason for its belief in its subjective dream world

Delbœuf arrives at the same conclu ion through a somewhat different line of argument We believe in the reality of dream pictures be cau e in sleep we have no other impressions with which to compare them because we are cut off from the outer world But it is not be *cau e we are unable* when *asleep* to test our hallucinations that we believe in their reality Dreams can make us believe that we are apply ing such tests—that we are touching say the rose that we see in our dream and yet we are dreaming According to Delbœuf there is no valid criterion that can show whether some *thing is* a dream or a *waking reality except*— and that only pragmatically—the fact of wak ing I conclude that all that has been experi enced between falling asleep and waking is a de lusion if I find on waking that I am lyin un dressed in bed (p 84) I considered the images of my dream real while I was asleep on account of the unsleeping *mental habit of* as suming an outer world with which I can con trast my e o

H ff l k D lbœuf h att mpted t xpl in th t f d m g by the lt t whi h a ab- m lly t d ced d t m t h po the th rw se ect f ctı g f the ta t psych c pp tus b t he d bes th d t om wh t d ff t t rm *H st t* th t th first d t g h g m k of d m s th bol t f t me d p æ th m p t f th p e tal m d th na th f d ine

If the turning away from the outer world is accepted as the decisive cause of the most conspicuous characteristics of our dreams it will be worth our while to consider certain subtle observations of Burdach's which will throw some light on the relation of the sleeping psyche to the outer world and at the same time serve to prevent our over-estimating the importance of the above deductions. Sleep says Burdach, results only under the condition that the mind is not excited by sensory stimuli ... yet it is not so much a lack of sensory stimuli that conditions sleep as a lack of interest in them some sensory impressions are even necessary in so far as they serve to calm the mind thus the miller can fall asleep only when he hears the clatter of his mill, and he who finds it necessary as a matter of precaution to burn a light at night cannot fall asleep in the dark (p 457)

During sleep the psyche isolates itself from the outer world, and withdraws from the periphery ... Nevertheless, the connection is not entirely broken if we did not hear and feel during sleep but only after waking we would assuredly never be awakened at all. The continuance of sensation is even more plainly shown by the fact that we are not always wakened by the mere force of the sensory impression, but by its relation to the psyche An indifferent word does not arouse the sleeper but if called by name he wakes ... that even in sleep the psyche discriminates between sensations ... Hence one may even be wakened by the absence of a sensory stimulus, if this is related to anything of imagined importance. Thus one man wakes when the nightlight is extinguished and the miller when his mill comes to a standstill that is waking is due to the cessation of a sensory activity and this presupposes that the activity has been perceived but has not disturbed the mind its effect being indifferent or actually reassuring (p 46 etc.)

with the sensory phantasy images and ... ll times have these as ... bs ra um. These activities do therefore participate in the ... rratic nature of the dream-representations. W ... as they particip ... f

dre ms (p. 3)

Compare with this the ... lemen ... f *Dé ... ennt* in which Claparède (1905) finds the mechanism of falling asleep.

Even if we are willing to disregard these by no means trifling objections we must yet admit that the qualities of dream life hitherto considered which are attributed to withdrawal from the outer world cannot fully account for the strangeness of dreams For otherwise it would be possible to reconvert the hallucinations of the dream into mental images and the situations of the dream into thoughts and thus to achieve the task of dream interpretation Now this is precisely what we do when we reproduce a dream from memory after waking and no matter whether we are fully or only partially successful in this retranslation the dream still remains as mysterious as before

Furthermore, all writers unhesitatingly assume that still other and profounder changes take place in the plastic material of waking life Strumpell seeks to isolate one of these changes as follows (p 17) With the cessation of active sensory perception and of normal consciousness the psyche is deprived of the soil in which its feelings desires interests and activities are rooted. Those psychic states, feelings interests and valuations which in the waking state adhere to memory images succumb to an obscuring pressure in consequence of which their connection with these images is severed the perceptual images of things persons localities events and actions of the waking ... are individually abundantly reproduced but none of them brings with it its psychic value Deprived of this they hover in the mind dependent on their own resources

This annihilation of psychic values which is in turn referred to turning away from the outer world is according to Strumpell very largely responsible for the impression of strangeness with which the dream is coloured in our memory

We have seen that the very fact of falling asleep involves renunciation of one of the psychic activities—namely the voluntary guidance of the flow of ideas Thus the supposition obtrudes itself (though it is in any case a natural ...) that the state of sleep may extend even to the psychic functions On one another of these functions is perhaps entirely suspended

we have now to consider whether the rest con tinue to operate undisturbed whether they are able to perform their normal work under the circumstances The idea occurs to us that the peculiarities of the dream may be explained by the restricted activity of the psyche during sleep and the impression made by the dream upon our waking judgment tends to confirm this view The dream is incoherent it recon ciles without hesitation the worst contradic tions it admits impossibilities it disregards the authoritative knowledge of the waking state and it shows us as ethically and morally obtuse He who should behave in the wakin state as his dreams represent him as behaving would be considered insane He who in the waking state should speak as he does in his dreams or relate such things as occur in his dreams would impress us as a feeble minded or muddle headed person It seems to us then that we are merely speaking in accordance with the facts of the case when we rate psychic activity in dreams very low and especially when we assert that in dreams the higher intellectual activities are suspended or at least greatly impaired

With unusual unanimity (the exceptions will be dealt with elsewhere) the writers on the sub ject have pronounced such judgments as lead immediately to a definite theory or explana tion of dream life. It is now time to supple ment the résumé which I have just given by a series of quotations from a number of authors —philosophers and physicians—bearing upon the psychological characteristics of the dream

According to Lemoine the *incoherence* of the dream images is the sole essential characteristic of the dream

Maury agrees with him (*Le Sommeil* p 163) *Il n y a pas des reves absolument raisonnables et qui ne contiennent quelque inco hérence quelque absurdité*

According to Hegel quoted by Spitta the dream lacks any intelligible objective coher ence

Du as says *Les reve c est l anarchie psy chique affective et mentale c est le jeu des fonctions livrées a elles memes et s exerçant sans contrôle et sans but dans le reve l esprit est un automate spirituel*

Th a d am which a e b l t ly easo abl wh ch do t c ta s m h m ab d ty —ED

— — l d i themsel es t d to —ED

The relaxation dissolution and promiscuous confusion of the world of ideas and images held to ether in waking life by the logical power of the central ego is conceded even by Volkelt (p 14) according to who e theory the psychic activity during sleep appears to be by no mea s aimle s

The absurdity of the as ociations of ideas which occur in dreams can hardly be more strongly sti matized than it was by Cicero (*De Divinatione* II lxxi) *Nihil tam praepostere tam incondite tam monstruose cogitari potest quod non possimus somniare*

Fechner says (p 5 2) It i as though the psychological activity of the brain of a rea on able person were to migrate into that of a fool

Radestock (p 145) It seems indeed im possible to recognize any stable laws in this preposterous behaviour Withdrawing itself from the strict policing of the rational will that guides our waking ideas and from the proc esses of attention the dream in crazy sport whirls all things about in kaleidoscopic con fusion

Hildebrandt (p 45) What wonderful jumps the dreamer permits himself for in stance in his chain of reasoning! With what unconcern he sees the most familiar laws of experience turned upside down! What ridicu lous contradictions he is able to tolerate in the order of nature and of society before things go too far and the very excess of nonsense lead to an awakening! Sometimes we quite in nocently calculate that three times three make twenty and we are not in the lea t surprised if a dog recites poetry to us if a dead person walks to his grave or if a rock floats on the water We solemnly go to visit the duchy of Bernburg or the principality of Liechten tem in order to inspect its navy or we allow our selves to be recruited as a volunteer by Charles XII just before the battle of Poltava

Binz (p 33) referring to the theory of dreams resulting from these impressions says

Of ten dreams nine at least have an ab urd content We unite in them persons or things which do not bear the sl ghtest relation to one another In the next moment as in a kaleido scope the grouping changes to one if possible even more nonsensical and irrational than be fore and so the hifting play of the drowsy brain continues until we wake put a hand to our forehead and ask ourselves whether we

Th re s im g bl th g too bs rd too In v l d r too ab ormal f u t d eam bout.—ED

still really posse s the f cu ty of rational im agmatio and thought.

M ury *Le Sommeil* (p. 50) makes in re- pect of the relation of the d eam ma e to the waking thou ts, a comparison wh ch a physi cian will fi d e pecially impres i e *La pro- d ct on de ces mag s q e che l'h mme é e fait le plus souve a t e l volonté corre- spond pour l' el ger ce à ce que so t pour la mo é certains m vemen s que nous o ent la cho ée et les af ctions paral ques* F r the rest he considers the dream *tou e une série de dégradat ons de la faculté pensante e asso ante*[1] (p 27)

It s hardly necessary to c te the utterances of those a thors who repeat M ury s assertion in re- spect of t higher indi dual p ychic act vit es.

Acc rding to S rumpell in dreams—and even, of course where the o sen cal nature of th dream is not bv o s—all the l g cal operat of the mind based on relat ons and a sociatio reced into the background (p 6) According t Sp tt (p 148) deas in dreams are ent rely w thdrawn from the laws f causality while Radestock and others em pa ze th feeble ess of j dgment and log cal f renc peculiar to dreams. Accord g to Jodl (p. 3) there is o cr i sm in dreams no c rrect g of a series of perceptions by the co tent of consc ous ess s a whole The same au h r s a es that All the ct t es of con- sc ou ess occur n dreams but they are in perf ct mhib ted a d mut ally olated. The con rad ct ons of ou c cious knowledge whi h occu dreams are expl ed b Strick r a d ma y rs on th ground that facts are forgotten i dreams or that the logical rela tions bet een idea are lost (p 98) etc etc

Those a hors who n ger ral judge un f vourably of the psych c ct ities of the dre m neverth les agree that dreams d re- ta ertai rem an of ps ch c act ity Wundt whose t h g has nflue ced so ma y o h r res rs ors of re m problem express ly m t t s. W may k what are the na ture a d mpo ion f the emnants of m l psy h c lif which ma fest themsel es in dre m. It is pretty generally k owledged that th reprod ctive f culty the memory seems to be th least ff cted in dre ms it m y indeed how a certa n superiorit over the same function in waking life (ee above p. 141) even though ome of the absurdit es of dre ms are to be explained by the forgetful ess of dream life According to Sp tta t is the sentimental life of the psyche wh h s not af fected by sleep and which thus direct our dreams By ent ment (*Gemut*) he means 'the constant sum of the emot ons as the inmost subjecti e esse ce of the man (p 84)

Schol z (p. 37) sees in dreams a psy chic act v ity which manifests it elf in the allegorizing interpretation to which the dream material is subjected. S beck (p. 11) likewise perce es in dreams a supp ementary interpretat ve acti y" of the psyche which appl es it lf to all that is observed and percei ed A v judgement of the part played in dreams by what is presumed to be the highest ps chical func tion i.e conscious es presents a peculiar dif ficulty Since it is only through con c ousness that we can know anything of dream there can be no doubt as to its being reta ned. Sp tta ho ever believes that only *conse o s ess* is re tained in the dre m but not *self co sc ousness* Delbœuf co fesses that he is unable to compre- bend this di tinct on.

The laws of a sociati n which connect our mental images hold good also for what is repre of pure represent t on or in accordance with the laws of organic stimuli accompan ed by such represe tat ons that is without bein in fluenced by reflect on, reason, aesthet c t te or moral j dgment. The authors whose opin ions I h re reprod ce c ce e the form tion of th dream somewhat as follows The sum of sensory st mul f varying origin (d scu sed elsewh re) that are perati e n sleep at f rst wake the psy he number of im g s whi h prese t themsel es as hallucin t ons (ac cord g to Wundt t is more corre t to say as illus ons because of the r origin i e t rnal d ternal st mul) These comb ne w th e anoth r in accordance w th the kno n laws of as ociation, and, in accordance w th the same laws they n turn evoke a new s f repre sent t s (images) The whole of th material is then elaborated as far as poss ble by the still ctive remnant of the thinki g and organizing f culties of the psyche (cf Wundt and Wey gandt) Thus f r however n one has been

Those uthors wh in general, j d o un fa ourably of the psychi cti i es of the dreamer neverth les agree that dream d retain rtain remnant of ps ch c activ ty Wundt whose t hin has influen ed so many other in est gators of dream problems expre sly dm ts this W may a k what are the na t re a d mpos tion f th emnants of normal psychic life whi h manifest themsel es in dreams? It is pretty generally cknowledged that the reproductive faculty the mem ry seems t be the lea t a ected in dre ms it may indeed how a certain superiority over the same function in waking life (ee above p. 14) e en thou h some of the absurdities of dreams are to be explained by the forgetfulness of dream life According to Sp tta it is the sentimental life of the psyche which is not affected by sleep and which thus d rect our dreams By en iment (*Gemüt*) he means the constant sum of the emot ons as the inmost subjective essence of the man (p 84)

Scholz (p 37) sees in dreams a psychic activity which manifests it elf n the allegorizing interpretation to which the dream material is subjected. Siebeck (p. 11) likewise perceives in dreams a supplementary interpretat e activ y" of the psyche which applies it elf to all that is observed and perceived Any judgment of the part played in dreams by what is presumed to be the highest psychical func tio consciousness presents a peculiar dif ficulty Since it is only th ough consciousness that we ca know anything of dreams there can be n do bt as to its being reta ned. Sp tta howe er believes that only *consci s ess* is retained in the dream but not *self-co sc ousness* Delbœuf confesses that he is unable to comprehend this distinct on.

The laws of association which connect our m ntal images h ld good also for what is represented in dreams indeed, in dreams the dominance of these laws is m re ob ous and compl te than in the waking tate Strumpell (p o) says "Dreams would appear to proceed e ther clusivel in accorda ce with the laws of pure representatio or in accordance with the laws of organic timuli accompan ed by such represe tations that is without be n n fl enced by reflection, reason aesth t c taste o moral j d ment. The authors whose opin ons I he reprod ce concei the formati n of th dream somewhat as follows The sum of sensory stimuli f varying origin (di cussed elsewhere) that re operati e in sleep at first waken in the psyche number of im ges which prese t themsel es as hallucinations (ac co ding to Wundt it is m re orrect t say as illus on because of their origin xternal and internal stimuli) These c mbine with o e a the in c rdance with the known laws of association, and in cordance with the same laws they in turn e oke a new series of repre sent t o s (images) The wh l of this material is then laborated as far as poss b e by the till ctive remnant f th thinking and rganizing f culties of th psych (cf Wundt a d Weygandt) Thus far however no one has been

A hole series f degradations f the faculty f thi king and reasoning.—ED.

we have now to consider whether the rest con tinue to operate undisturbed whether they are able to perform their normal work under the circumstances The idea occurs to us that the peculiarities of the dream may be explained by the restricted activity of the psyche during sleep and the impression made by the dream upon our waking judgment tends to confirm this view The dream is incoherent it recon ciles without hesitation the worst contradic tions it admits impossibilities it disregards the authoritative knowledge of the waking state and it shows us as ethically and morally obtuse He who should behave in the waking state as his dreams represent him as behaving would be considered insane He who in the waking state should speak as he does in his dreams or relate such things as occur in his dreams would impress us as a feeble minded or muddle headed person It seems to us then that we are merely speaking in accordance with the facts of the case when we rate psychic activity in dreams very low and especially when we assert that in dreams the higher intellectual activities are suspended or at least greatly impaired

With unusual unanimity (the exceptions will be dealt with elsewhere) the writers on the sub ject have pronounced such judgments as lead immediately to a definite theory or explana tion of dream life It is now time to supple ment the résumé which I have just given by a series of quotations from a number of authors —philosophers and physicians—bearing upon the psychological characteristics of the dream

According to Lemoine the *incoherence* of the dream images is the sole essential characteristic of the dream

Maury agrees with him (*Le Sommeil* p 163) *Il n y a pas des reves absolument raisonnables et qui ne contiennent quelque inco hérence quelque absurdité*

According to Hegel quoted by Spitta the dream lacks any intelligible objective coher ence

Dugas says *Les reve c est l anarchie psy chique affective et mentale c est le jeu des fonctions livrées a elles memes et s exerçant sans controle et sans but dans le reve l esprit est un automate spirituel*

the central ego is conceded even by Volkelt (p 14) according to whose theory the psychic activity during sleep appears to be by no means aimless

The absurdity of the associations of ideas which occur in dreams can hardly be more strongly sti matized than it was by Cicero (*De Divinatione* II lxxi) *Nihil tam praepostere tam incondite tam monstruose cogitari potest quod non possimus somniare*

Fechner says (p 522) It is as though the psychological activity of the brain of a reason able person were to migrate into that of a fool

Radestock (p 145) It seems indeed im possible to recognize any stable laws in this preposterous behaviour Withdrawing itself from the strict policing of the rational will that guides our waking ideas and from the proc esses of attention the dream in crazy sport whirls all things about in kaleidoscopic con fusion

Hildebrandt (p 45) What wonderful jumps the dreamer permits himself for in stance in his chain of reasoning! With what unconcern he sees the most familiar laws of experience turned upside down! What ridicu lous contradictions he is able to tolerate in the order of nature and of society before things go too far and the very excess of nonsense leads to an awakening! Sometimes we quite in nocently calculate that three times three make twenty and we are not in the least surprised if a dog recites poetry to us if a dead person walks to his grave or if a rock floats on the water We solemnly go to visit the duchy of Bernburg or the principality of Liechtenstein in order to inspect its navy or we allow our selves to be recruited as a volunteer by Charles XII just before the battle of Poltava

Binz (p 33) referring to the theory of dreams resulting from these impressions says Of ten dreams nine at least have an absurd content We unite in them persons or things which do not bear the sl ghtest relation to one another In the next moment as in a kaleido scope the grouping changes to one if possible even more nonsensical and irrational than be fore and so the shifting play of the drowsy brain continues until we wake put a hand to our forehead and ask ourselves whether we

the intelli ence

J Starke has drawn attention to the fact that a sim lar s lut on of the incoh rence of dreams was put forward in 1 99 by an old writer Wolf D idson who was unknown to me (p 136) The peculiar leaps of our imaginings in the d eam-state all ha e their cau e in the laws of association but this connection often occurs very obscurely in the soul so that we frequently seem to observe a leap of the imagination where none really exists."

The evaluation of the dream as a psychic product in the lit rature of the subject varies over a ery wide cale t extends from the extreme of under-estimat on, as we ha e already een throu h premonitions that t may ha e a value as yet un e ealed to an exaggerated over-estimation which sets the dream life far above the c pacities of waking life In his psychological characterizat on of dream life, Hildebrandt as we know groups it into three antinomies and he omb nes in the th rd of these antinomi s the two extreme po nts of this scale of values (p 19) It is the contrast between on the o e hand an enhancement an increase of potent ality which often amounts to rtuo ty and n the other hand a decided diminution and enfeeblement of the psychic life often to a ub human level.

As regard the first who is there that can not co firm from his own expe ence the fact that in th wo kings and wea ings f the genius f dream th r are met mes exhib ted a profundity and sinc rity of em tion a tend rness of feeling a le rness of vi w subtlety of observation and a re dine s of wit uch as we should ha e modestly to de y that we always possessed n our w king life? D eams ha e a wo derful poetry an ppo te all gory an in omparable s nse of hum u a d li htful irony They see the world in the li ht of a peculiar dealizat and ft n intensify the eff t of the phe omena by the most ingeni us und r h m Th y ily ra y sty in its ous be omes indescribably d drastically com cal. And o wakin we are s metimes still s full of on f these mpres ons that t will occur to us that such things ha e n er yet been offered to us by th real w ld

successful in discerning the motive which would decide what particular law of association is to be obeyed by those images which do not originate in external stimuli

But it has been repeatedly observed that the associations which connect the dream images with one another are of a particular kind differing from those found in the activities of the waking mind Thus Volkelt (p 15) In dreams the ideas chase and seize upon one another on the strength of accidental similarities and barely perceptible connections All dreams are pervaded by casual and unconstrained associations of this kind Maury attaches great value to this characteristic of the connection of ideas for it allows him to draw a closer analogy between the dream life and certain mental derangements He recognizes two main characteristics of delina (1) *une action spontanée et comme automatique de l esprit ( ) une association vicieuse et irregulière des idées* (p 1 6) Maury gives us two excellent examples from his own dreams in which the mere similarity of sound decides the connection between the dream representations Once he dreamed that he was on a pilgrimage (*pélerinage*) to Jerusalem or to Mecca After many adventures he found himself in the company of the chemist Pelletier the latter after some conversation gave him a galvanized shovel (*pelle*) which became his great broadsword in the next portion of the dream (p 137) In another dream he was walking along a highway where he read the distances on the kilometre stones pre ently he found him elf at a grocer s who had a large pair of scales a man put *kilogramme* weights into the scales in order to weigh Maury the grocer then said to him You are not in Paris but on the island *Gilolo* This was followed by a number of pictures in which he saw the flower *lobelia* and then General *Lope* of whose death he had read a little while previously Finally he awoke as he was playing a game of *lotto*

We are indeed quite well aware that this low estimate of the psychic activities of the dream has not been allowed to pass without contradiction from various quarters Yet here contradiction would seem rather difficult It is not a matter of much significance that one of the depreciators of dream life Spitta (p 118) should assure us that the same psychological laws which govern the wakin state rule the dream also or that another (Dugas) should state *Le reve n est pas déraison ni meme ir raison pure* so long as neither of them has attempted to brin this opinion into harmony with the psychic anarchy and dissolution of all mental functions in the dream which they themselves have described However the possibility seems to have dawned upon others that the madness of the dream is perhaps not without its method—that it is perhaps only a disguise a dramatic pretence like that of Hamlet to whose madness this perspicacious jud ment refers These authors must either have refrained from judging by appearances or the appearances were in their ca e altogether different.

Without lingering over its superficial absurdity Havelock Ellis considers the dream as an archaic world of vast emotions and imperfect thoughts the study of which may acquaint us with the primitive sta es of the development of mental life J Sully (p 362) presents the same conception of the dream in a still more comprehensive and penetrating fa h ion His statements de erve all the more consideration when it is added that he perhaps more than any other psycholo ist was convinced of the veiled significance of the dream Now our dreams are a means of conserving these successive personalities When asleep we go back to the old ways of looking at things and of feelin about them to impulses and activities which lon a o dominated us A thinker like Delbœuf asserts—without ind ed adducing proof in the face of contradictory data and hence without real justification— *Dans le sommeil hormis la perception toutes les facultés de l esprit intelligence imagination mémoire volonté moralité restent intactes dans leur essence seulement elles s appliquent à des objets imaginaires et mobiles Le songeur est un acteur qui joue a volonté les fous et les sages les bourreaux et les victimes les nains et les géants les demons et les anges* (p 222) The Marquis Hervey who is flatly contradicted by Maury and whose essay I have been unable to obtain despite all my efforts appears emphatı

H rv y de St. D ys.

the dream the subsidiary problem as to whether and to what extent the moral dispositions and feelings of waking life extend into dream-life. The same contradictions which we were surprised to observe in the descriptions by various authors of all the other psychic activities will surprise us again here. Some writers flatly assert that dreams know nothing of moral obligations; others as decidedly declare that the moral nature of man persists even in his dream-life.

Our ordinary experience of dreams seems to confirm beyond all doubt the correctness of the first assertion. Jessen says (p. 553): "Nor does one become better or more virtuous during sleep; on the contrary, it seems that conscience is silent in our dreams, inasmuch as one feels no compassion and can commit the worst crimes, such as theft, murder and homicide, with perfect indifference and without subsequent remorse."

Radestock (p. 146) says: "It is to be noted that in dreams associations are effected and ideas combined without being in any way influenced by reflection, reason, aesthetic taste, and moral judgment; the judgment is extremely weak, and ethical indifference reigns supreme."

Volkelt (p. 23) expresses himself as follows: "As every one knows, dreams are especially unbridled in sexual matters. Just as the dreamer himself is shameless in the extreme, and wholly lacking in moral feeling and judgment, so likewise does he see others, even the most respected persons, doing things which, even in his thoughts, he would blush to associate with them in his waking state."

Utterances like those of Schopenhauer, that in dreams every man acts and talks in complete accordance with his character, are in sharpest contradiction to those mentioned above. R. Ph. Fischer[1] maintains that the subjective feelings and desires, or affects and passions, manifest themselves in the wilfulness of the dream-life, and that the moral characteristics of a man are mirrored in his dream.

Haffner says (p. 25): "With rare exceptions ... a virtuous man will be virtuous also in his dreams; he will resist temptation, and show no sympathy for hatred, envy, anger and all other vices; whereas the sinful man will, as a rule, encounter in his dreams the images which he has before him in the waking state."

Scholz (p. 36): "In dreams there is truth; despite all camouflage of nobility or degradation, we recognize our own true selves.... The honest man does not commit a dishonouring crime even in his dreams, or if he does, he is appalled by it as by something foreign to his nature. The Roman emperor who ordered one of his subjects to be executed because he dreamed that he had cut off the emperor's head was not far wrong in justifying his action on the ground that he who has such dreams must have similar thoughts while awake. Significantly enough, we say of things that find no place even in our intimate thoughts: 'I would never even dream of such a thing.'"

Plato, on the other hand, considers that they are the best men who only dream the things which other men do.

Pfaff,[2] varying a familiar proverb, says: "Tell me your dreams for a time and I will tell you what you are within."

The little essay of Hildebrandt's from which I have already taken so many quotations (the best-expressed and most suggestive contribution to the literature of the dream-problem which I have hitherto discovered), takes for its central theme the problem of morality in dreams. For Hildebrandt, too, it is an established rule that the purer the life, the purer the dream; the impurer the life, the impurer the dream.

The moral nature of man persists even in dreams. "But while we are not offended or made suspicious by an arithmetical error, no matter how obvious, by a reversal of scientific fact, no matter how romantic, or by an anachronism, no matter how ridiculous, we nevertheless do not lose sight of the difference between good and evil, right and wrong, virtue and vice. No matter how much of that which accompanies us during the day may vanish in our hours of sleep, Kant's categorical imperative dogs our steps as an inseparable companion, of whom we cannot rid ourselves even in our slumber.... This can be explained only by the fact that the fundamental element of human nature, the moral essence, is too firmly fixed to be subjected to the kaleidoscopic shaking-up to which phantasy, reason, memory and other faculties of the same order succumb in our dreams" (p. 45, etc.).

In the further discussion of the subject we find in both these groups of authors remarkable evasions and inconsequences. Strictly speaking, an interest in immoral dreams should be at an

[1] *Grundzüge des Systems der Anthropologie*, Erlangen, 1850 (quoted by Spitta).

[2] *Das Traumleben und seine Deutung*, 1868 (cited by Spitta, p. 192).

the profound and sensitive dreams? And if *both kinds of dreams do occur—that is dreams* that merit both these judgments—does it not *seem idle to seek a psychological* characteriza tion of the dream? Would it not suffice to state *that everything is possible in the dream* from the lowest degradation of the psychic life to its *flight to heights unknown in the waking state?* Convenient as such a solution might be it has *this against it* that behind the efforts of all the investigators of dreams there eems to lurk the *assumption that there is in dreams some char* acteristic which is universally valid in its essen *tial features and which must eliminate all* these contradictions

It is unquestionably true that the mental ca pacities of dreams found readier and warmer *recognition in the intellectual* period now ly ing behind us when philosophy rather than ex *act natural science ruled the more intelligent* minds Statements like that of Schubert to *the effect that the dream frees the mind from* the power of external nature that it liberates *the soul from the chains of ensory life to* gether with similar opinions expressed by the younger Fichte *and others* who *repre ent* dreams as a soaring of the mind to a hi her plane—all these *seem hardly conceivable to* us today they are repeated at present only by mystics and devotees With the advance of a scientific mode of thought a reaction took place in the estimation of dreams It is the medical writers who are most inclined to underrate the psychic activity in dreams as being insignif icant and valueless while philosophers and un professional observers—amateur psychologists —whose contributions to the subject in especial must not be overlooked have for the most part in agreement with popular belief laid em phasis on the psychological value of dreams Tho e who are inclined to underrate the psychic activity of dreams naturally show a preference for the somatic sources of excitation in the aetiology of the dream those who admit that the dreaming mind may retain the greater part of its waking faculties naturally have no mo tive for denying the existence of autonomous stimulations

Amon the superior accomplishments which one may be tempted even on a sober compari son to ascribe to the dream life that of mem ory is the most impressive We have fully dis cus ed the by no means rare experiences which prove this superiority Another privilege of the dream life often extolled by the older writers

marks is merely illusory dreams disregard time and space only as does waking thought, and only because dreaming is itself a form of thinking Dreams are supposed to enjoy a fur ther advantage in re pect of time—to be in dependent of the pas age of time in yet another sense Dreams like Maury s dream of his exe cution (p 14, above) *seem to show that the per* ceptual content which the dream can com press into a very short space of time far ex ceeds that which can be mastered by our psychic activity *in its wakin thoughts These* conclusions have however been di puted The *essays of Le Lorrain and Egger on The Appar ent Duration of Dreams* gave rise to a long and *interesting discussion which in all* probability has not yet found the final explanation of this *profound and delicate problem*

That dreams are able to continue the intel *lectual activities of the day and to carry* them to a point which could not be arrived at during the day that they *may* resolve doubts and problems and that they may be the source of fresh in piration in poets and composers eems in the light of numerous records and of the collection of instances compiled by Chabaneix to be proved beyond question But even though the facts may be beyond dispute their inter pretation is subject to many doubts on wider grounds

Finally the alleged divinatory power of the dream has become a subject of contention in which almost insuperable objections are con fronted by obstinate and reiterated assertions. It i of course right that we should refrain from denying that this view has any basis what ever in fact since it is quite possible *that a* number of such cases may before long be ex plained on purely natur l *psychological grounds*

Γ *The Ethical Sense in Dreams*

For reasons which will be intelligible only after *a con ideration of my own investigations* of dreams I have isolated from the psycholo y of

ar y These same thou hts and the same evalu ation of these thoughts ha e as we know caused devout and holy men f all ages to la ment that they were wicked inners.

The general occurrence f these contrastin thoughts in th maj rity of men, and even in other regions than the ethical, s of course es- ta lished beyond doubt. They ha e some- tim been judged in less serious spirit. Spitta qu es a relevant passage from A. Zeller (Arti- cle *Irre* in the *Allg mei e E cyklop e der Wissens h ften* Ersch and Gruber p 144)

An intellect is rarel so happil organized as to be in full comma d of tself at all times and ses on and never t be disturbed in th l cid and constant processes of thought by deas ot merely unessential but bsolu ely grotesque and on ensical indeed, the greatest think rs ha e had cause to complain of this dream like tormenting and distressing rabble of deas, which di turbs their profoundest contempla tion and their most pious and earnest medita tions.

A learer light is thrown on the psychologi cal meaning f these contrasting thoughts by a further bservation of Hild brandt s to the effect that dreams permit us an occa onal ...

pology when he tate that ou dreams may perhaps be intended to reveal to us not what we are but what we might have been if we had had another upbringin and by Rades ock (p. ...

th k f a person. b to my great surprise, dream has m re than once taught m what I do reall th k of him and feel abo him. And J H. Fi expresses himself in like manner "The haract f our dreams gi es a f r truer reflection of our general dispos on than anything that we can learn by self-obse vation in the waking state ch remarks as this of Benini call our ttention t the f ct

that the emergence of impulses which are for eign to our ethical co sciousness is merely anal ogous to the manner already familiar to us, in which the dream disposes of other represent ati e material *Certe nostre incl nazion che si credevano soffocate e spente da un pe o si ridestano passioni vecchie e sepolte revivo o cose e persone a cui non pensiamo mai ci ven gono dinan i?* (p 149) Volkel expresses him self in imilar fashion E en ideas which have entered into our consciousness almo t un noticed and which, perhaps it has never be- fore called out of obli n, often announc their presence in th mind throu h dream (p 105) Finall we may remember that according to Schleiermacher th sta e of falling a leep is accompanied by the appearance of *undesired imaginings*.

We may include in such undesired imagin ings the whole of that imaginati e material the occurrence of which urprises us in im m ral as w ll as in absurd dreams. The only important difference consists in the fact that the undesired imaginings in the m ral sphere are in opposition t our usual feelings whereas the thers merel ppear strange to us So far n thing has been d e to enable us to reco cile this difference by a prof under under standing

B t what i the significance f the emer gence of undesi red representations n dreams? What conclus ons can the psychology of the waking and dreaming mind draw from these nocturnal manifestations of contrasting ethical impulses? Here we find a fresh d ersity of opinion and also a diffe ent grouping of the uthors wh have treated f the subject. The line of thou t followed by Hild brandt, and by others wh hare his fundamental opinion, cannot be co tinued otherwise than by ascrib- ing to the imm ral impulses even in the wak ing tat a latent vitality which is indeed in hib ed from proceedin to action and by as serting that during sleep something falls way from us which, having th effect of an inhib tion has kept us from becoming ware of th existence f such impulses Dreams therefore reveal the true f the whole nature of th dreamer and are one means f making the hidden life of the psych cces ible to our un d rstanding It is only on su h h potheses that Hild brand can attrib te t th dream th ole of moni w calls our ttention to th secret mi chi f in th soul, just cc rding to the phys cian it may announce a hitherto un bserved physical disorde Spitta too must

I not uninteresting consider the tude I the Inqu ion to this pro lem. I the *T act tus d Officio* ... f Thomas Carena (Lyons ed., 165) one finds the following pa sage ... heresies in hi dreams ... ors shall consider thi reason for inves gating h conduct in li for th is won to return in sleep ... occupies man during the day" (Dr Ehniger ... Switzerland)

end for those who assert that the moral per sonality of the individual falls to pieces in his dreams They could as coolly reject all attempts to hold the dreamer responsible for his dreams or to infer from the immorality of his dreams that there is an immoral strain in his nature as they have rejected the apparently analo ous *attempt to prove from the absurdity of his* dreams the worthlessness of his intellectual life in the waking state The others according to whom the categorical imperative extends even into the dream ought to accept *in toto* the no tion of full responsibility for immoral dreams and we can only hope that their own reprehen *sible* dreams do not lead them to abandon their otherwise firm belief in their own moral worth

As a matter of fact however it would eem that although no one is positively certain just how good or how bad he is he can hardly deny that he can recollect immoral dreams of his own That there are such dreams no one denies the only question is how do they ori inate? So that in spite of their conflicting judgments of dream morality both groups of authors are at pains to explain the genesis of the immoral dream and here a new conflict arises as to whether its origin is to be sought in the normal functions of the psychic life or in the somati cally conditioned encroachments upon this life The nature of the facts compels both those who argue for and those who argue against moral responsibility in dream life to a ree in recog nizing a special psychic source for the immor ality of dreams

Tho e who maintain that morality continues to function in our dream life nevertheless re frain from assuming full responsibility for their *dreams Haffner says (p 24) We are not re* sponsible for our dreams because that basis which alone gives our life truth and reality is withdrawn from our thoughts and our will Hence the wishes and actions of our dreams cannot be *virtuous or sinful Yet the dreamer* is responsible for the sinful dream in so far as indirectly he brings it about Thus as in wak ing life it is his duty just before going to sleep morally to cleanse his mind

The analysis of this admixture of denial and recognition of responsibility for the moral con *tent of dreams is* carried much further by Hil debrandt After arguing that the dramatic meth

time and the debasement *and contusion ot tne* imaginative elements of dreams which even *he admits must be allowed for* in respect of the immoral appearance of dreams he nevertheless confesses that there are the most serious ob jections to flatly denying all responsibility for the lapses and offenses of which we are guilty in our dreams

(P 49) If we wish to repudiate very de *cisively* any sort of unjust accusation and es pecially one which has reference to our inten tions and convictions we u e the expression We should never have dreamt of such a thing By this it is true we mean on the one hand that we consider the region of dreams the last and remotest place in which we could be held re ponsible for our thou hts becau e there these thou hts are so loosely and incoherently *connected with our real being* that we can after all hardly regard them as our own but inasmuch as we feel impelled expressly to deny the existence of such thou hts even in this re gion we are at the same time indirectly admit ting that our justification would not be com plete unless it extended even thus far And I *believe that here although unconsciously* we are speaking the language of truth

(P 52) No dream action can be imagined whose first beginnings have not in some shape already passed through the mind during our waking hours in the form of wish desire or impulse Concerning this original impulse we *must say* The dream has not discovered it—it has only imitated and extended it it has only elaborated into dramatic form a scrap of his torical material which it found already existing within us it brings to our mind the words of *the Apostle—that he* who *hates his brother is* a murderer And thou h after we wake being *conscious of our moral strength* we may smile at the whole widely elaborated structure of the depraved dream yet the ori inal material out of which we formed it cannot be laughed away One feels responsible for the transgressions of *one s dreaming self not for the whole* sum of them but yet for a certain percentage In short if in this sense which can hardly be im pugned we understand the words of Chri t, that out of the heart come evil thoughts then we can *hardly help* being *convinced that every* sin committed in our dreams brings with it at least a vague minimum of guilt

Thus Hildebrandt finds the source of the immorality of dreams in the germs and hints of evil impulses which pass through our minds during the day as mental temptations and he *does not hesitate* to include these immoral ele ments in the ethical evaluation of the person

served characterist cs from a n e point of vi w d which at the sam time defines the relation of the dream to more comprehensi e phere f phenomena may be described as a theory f the dream The individual theories of t dr am will be d nguished from one an oth r by the r de m tin s essential this or that ch racteristic of dreams and relatin there to th ir da a nd their explanations It is not absolutely necessary that we should deduce from the theory of the dream a function, i e a use o any su h imilar role but expectat on be s ma ter of hab t teleolo ically in clined, will evertheless welcome those theories w ch a rd us ome ins ht into a functi n of dreams

be influenced by this conception when he re fers for example to the stream of excitations which flow in upon the psyche during puberty and consoles the dreamer by assuring him that he has done all that is in his power to do if he has led a strictly virtuous life during his wak in" state if he has made an effort to suppress the sinful thoughts as often as they arise and has kept them from maturing and turning into action According to this conception we might designate as undesired imaginings those that are *suppressed* during the day and we must recognize in their emergence a genuine psychic phenomenon

According to certain other authors we have no right to draw this last inference For Jessen (p 360) the undesired ideas and images in the dream as in the waking state and also in the delirium of fever etc possess the character of a voluntary activity laid to rest and of a proces sion to some extent mechanical of images and ideas evoked by inner impulses An im *moral dream proves nothing in respect of the* psychic life of the dreamer except that he has somehow become cognizant of the imaginative content in question it is certainly no proof of a psychic impulse of his own mind Another writer Maury makes us wonder whether he too does not ascribe to the dream state the power of *dividing the psychic activity into its* components instead of aimlessly destroying it He speaks as follows of dreams in which one oversteps the bounds of morality *Ce sont nos penchants qui parlent et qui nous font agir sans que la conscience nous retienne bien que parfois elle nous avertisse J ai mes défauts et mes penchants vicieux à l état de veille je tache de lutter contre eux et il m arrive asse souvent de n y pas succomber Mais dans mes songes j y succombe toujours ou pour mieux dire j agis par leur impulsion sans crainte et sans remords Evidemment les visions qui se déroulent devant ma pensée et qui consti tuent le reve me sont suggérées par les incita tions que je ressens et que ma volonté absente ne cherche pas a refouler* —*Le Sommeil* (p 113)

If one believed in the power of the dream to reveal an actually existing but suppressed or concealed immoral disposition of the dreamer one could not express one s opinion more em

[illegible]

Dès qu il suspend l exercise de sa volonté il devient le jouet de toutes les passions contre lesquelles à l état de veille la conscience le sentiment d honneur la crainte nous défen dent In another place he makes the strikin assertion (p 462) *Dans le reve c est surtout l homme instinctif que se révèle L homme revient pour ainsi dire à l état de nature quand il reve mais moins les idées acquises ont pénétré dans son esprit plus les penchants en desaccord avec elles conservent encore sur lui d influence dans le rêve* " He then mentions, as an example that his own dreams often re veal him as a victim of just those supersti tions which he has most vigorously attacked in his writings

The value of all these acute observations is however impaired in Maury s case because he refuses to recognize in the phenomena which he has so accurately observed anything more than a proof of the *automatisme psychologique* which in his own opinion dominates the dream life He conceives this automatism as the com plete opposite of psychic activity

A passage in Stricker s *Studien uber das Be wusstsein* reads Dreams do not consist purely and simply of delusions for example if one is afraid of robbers in a dream the robbers indeed are imaginary but the fear is real Our atten tion is here called to the fact that the affective development of a dream does not admit of the judgment which one bestows upon the rest of the dream content and the problem then arises What part of the psychic processes in a dream may be real? That is to say what part of them may claim to be enrolled among the psychic processes of the waking state?

set free constantly increases the irrationality of the dream becomes constantly less

The conception of the dream as an incomplete partial waking state or traces of the influence of this conception will of course be found in the works of all the modern physiologists and philosophers It is most completely represented by Maury It often seems as though this author conceives the state of being awake or asleep as susceptible of shifting from one anatomical region to another each anatomical re ion seeming to him to be connected with a definite psychic function Here I will merely suggest that even if the theory of partial waking were confirmed its finer superstructure would still call for exhaustive consideration

No function of dreams of course can emerge from this conception of the dream life On the contrary Binz one of the chief proponents of this theory consistently enou h denies that dreams have any status or importance He says (p 357) All the facts as we see them urge us to characterize the dream as a *physical* process in all cases useless and in many cases definitely morbid

The expression *physical* in reference to dreams (the word is emphasized by the author) points of course in more than one direction In the first place it refers to the aetiology of dreams which was of special interest to Binz as he was studying the experimental production of dreams by the administration of drugs It is certainly in keeping with this kind of dream theory to ascribe the incitement to dreaming whenever possible exclusively to somatic origins Presented in the most extreme form the theory is as follows After we have put ourselves to sleep by the banishment of stimuli there would be no need to dream and no reason for dreaming until the morning when the gradual awakening throu h the fresh invasion of stimuli might be reflected in the phenomenon of dreaming But as a matter of fact it is not possible to protect our sleep from stimuli like the germs of life of which Mephistopheles complained stimuli come to the sleeper from all directions—from without from within and even from all those bodily regions which never trouble us during the waking state Thus our sleep is disturbed now this now that little corner of the psyche is jogged into the waking state and the psyche functions for a while with the awakened fraction yet is thankful to fall asleep again The dream is the reaction to the disturbance of sleep caused by the stimulus but it is when all is said a purely superfluous reaction

The description of the dream—which after all remains an activity of the psychic organ—as a physical process has yet another connotation So to describe it is to deny that the dream has the *dignity* of a psychic process The old simile of the ten fingers of a person ignorant of music runnin over the keyboard of an instrument perhaps best illustrates in what esteem the dream is commonly held by the representatives of exact science Thus conceived it becomes something wholly insusceptible of interpretation How could the ten fingers of a player ignorant of music perform a musical composition?

The theory of partial wakefulness did not escape criticism even by the earlier writers Thus Burdach wrote in 1830 If we say that dreaming is a partial waking then in the first place neither the wakin nor the sleeping state is explained thereby secondly this amounts only to saying that certain powers of the mind are active in dreams while others are at rest But such irregularities occur throughout life (p 482)

The prevailin dream theory which conceives the dream as a physical process finds a certain support in a very interesting conception of the dream which was first propounded by Robert in 1866 and which is seductive because it assigns to the dream a function or a useful result As the basis of his theory Robert takes two objectively observable facts which we have already discussed in our consideration of dream material (p 144 above) These facts are (1) that one very often dreams about the most insignificant impressions of the day and ( ) that one rarely carries over into the dream the absorbin interests of the day Robert as erts as an indisputable fact that those matters which have been fully settled and solved never evoke dreams but only such as lie incompleted in the mind or touch it merely in passing (p 10)

For this reason we cannot usually explain our dreams since their causes are to be found *in sensory impressions of the preceding day which have not attained sufficient recognition on the part of the d eamer* The condition permitting an impression to reach the dream is therefore that this impression has been disturbed in its elaboration or that it was too insignificant to lay claim to such elaboration

Robert therefore conceives the dream as a physical process of elimination which in its psychic reaction reaches the consciousness *Dreams are eliminatio is of thoughts nipped in*

the bud A man depri ed of th capac ty for dreaming w uld in time become mentally un balanced because a immense number of un finished and un ol ed th ughts and uperficial impressions would ecumulate in his brain un de the pres ure of which all that sho ld be in corporated in the m mory a a completed whole w uld be stifled The dream acts as safety al e for the over burdened bra n *D e ms possess a heal ng and u burdem g power* (p 32)

We h uld misund rstand R bert f we were o a k him how rep ese tat on i the dream could b ing about an unb de ing of the mind The writ r ppa ently co cluded from these two pecul arities of the dream material that d ri g sl ep u h an elimination of worthless imp ess ons s ffected *somehow* s a s matic pro s and th t d eaming is n t a speci l p y ch c proc s but only the inf rmation wh h we r ei e of such eliminati Moreover elim ination s t the only thing that takes place in the m d during l ep Robert himself add that th stim li f the day are likewi e el bor ated and what nn t be *eliminated from the* und gested thought materi l lying in the mind *is bound p into a c mpl ted wh l by me tal l es borrowed f om th magi t o* and is th en olled in the mem ry s a harmless phantasy p ctur (p 3)

set free constantly increases the irrationality of the dream becomes constantly less

The conception of the dream as an incom plete partial waking state or traces of the in fluence of this conception will of course be found in the works of all the modern physio logists and philosophers It is most completely represented by Maury It often seems as though this author conceives the state of being awake or asleep as susceptible of shifting from one anatomical region to another each anatomical region seeming to him to be connected with a definite psychic function Here I will merely suggest that even if the theory of partial waking were confirmed its finer superstructure would still call for exhaustive consideration

No function of dreams of course can emerge from this conception of the dream life On the contrary Binz one of the chief proponents of this theory consistently enough denies that dreams have any status or importance He says (p 357) All the facts as we see them urge us to characterize the dream as a *physical* pro cess in all cases useless and in many cases definitely morbid

The expression *physical* in reference to dreams (the word is emphasized by the author) points of course in more than one direction In the first place it refers to the aetiology of dreams which was of special interest to Binz as he was studying the experimental production of dreams by the administration of drugs It is certainly in keeping with this kind of dream theory to ascribe the incitement to dreaming whenever possible exclusively to somatic ori gins Presented in the most extreme form the theory is as follows After we have put our selves to sleep by the banishment of stimuli there would be no need to dream and no rea son for dreaming until the morning when the gradual awakening through the fresh invasion of stimuli might be reflected in the phenome non of dreaming *But as a matter of fact it is* not possible to protect our sleep from stimuli like the germs of life of which Mephistopheles complained stimuli come to the sleeper from [illegible]

when all is said a purely superfluous reaction

The description of the dream—which after all remains an activity of the psychic organ—as a physical process has yet another connota tion So to describe it is to deny that the dream has the *dignity* of a psychic process The old simile of the ten fingers of a person ignorant of music running over the keyboard of an in strument perhaps best illustrates in what es teem the dream is commonly held by the repre sentatives of exact science Thus conceived it becomes something wholly insusceptible of in terpretation How could the ten fingers of a player ignorant of music perform a musical composition?

The theory of partial wakefulness did not escape criticism even by the earlier writers Thus Burdach wrote in 1830 If we say that dreaming is a partial waking then in the first place neither the waking nor the sleepin state is explained thereby secondly this amounts only to saying that certain powers of the mind are active in dreams while others are at rest But such irregularities occur throughout life (p 482)

The prevailing dream theory which conceives the dream as a physical process finds a cer tain support in a very interesting conception of the dream which was first propounded by Rob ert in 1866 and which is seductive becau e it assigns to the dream a function or a useful re sult As the basis of his theory Robert takes two objectively observable facts which we have already discus ed in our consideration of dream material (p 144 above) These *facts are* (1) that one very often dreams about the most insignificant impressions of the day and ( ) that one rarely carries over into the dream the absorbing interests of the day Robert as erts as an indisputable fact that those matters *which* have been fully settled and solved never evoke dreams but only such as lie incompleted in the mind or touch it merely in passing (p 10) *For this reason we cannot usually* explain our dreams since their causes are to be found *in sensory impressions of the preceding day which have not attained sufficient recognition on the part of the d eamer* The condition permitting an impression to reach the dream is therefore that this impression has been disturbed in its elaboration or that it was too insignificant to lay claim to such elabor ation

Robert therefore conceives the dream as a physical process of elimination which in its psychic reaction reaches the consciousness *Dreams are eliminations of thoughts nipped in*

enunciates semblance of meaning, but the path of the philosopher is not illumined thereby. Such is the criticism of Scherner's exposition by one of his own followers.

Scherner is not one of those writers for whom the mind carries its undiminished faculties into the dream-life. He even explains how in our dreams the centrality and spontaneous energy of the ego become enervated; how cognition, feeling, will, and imagination are transformed by this decentralization; how the remnant of these psychic forces has not a truly mental character but is rather of the nature of a mechanism. But, on the other hand, the activity of the psyche which may be described as *phantasy*, freed from all rational governance and hence no longer strictly controlled, rises to absolute supremacy in our dreams. To be sure, it borrows all its building-material from the memory of the waking state, but with this material it builds up structures which differ from those of the waking state as day differs from night. In our dreams it reveals itself as not only reproductive but also *productive*. Its peculiarities give the dream-life its singular character. It shows a preference for the immoderate, the exaggerated, the prodigious, but by its liberation from the inhibiting categories of thought, it gains a greater flexibility and agility and m-

plastic symbolism. The dream-phantasy has not the language of concepts; what it wishes to say it must express in visible form, and since in this case the concept does not exert an inhibitory control, it depicts it in all the fulness, power and breadth of visible form. But hereby its language, plain though it is, becomes cumbersome, awkward, and prolix. Plain speaking is rendered especially difficult by the fact that it dislikes expressing an object by its actual image, but prefers to select an alien image, if only the latter is able to express that particular aspect of the object which it is anxious to represent. Such is the symbolizing activity of the phantasy. It is moreover very significant that the dream-phantasy reproduces objects not in detail, but only in outline, and in the freest possible manner. Its paintings therefore are like light and brilliant sketches. The dream-phantasy, however, does not stop at the mere representation of the object, but feels an internal urge to implicate the dream-ego to some extent with the object, and thus to give rise to action. The visual dream, for example, depicts gold coins lying in the street; the dreamer picks them up, rejoices and carries them away.

According to Scherner, the material upon which the dream-phantasy exerts its artistic activity consists preponderantly of the organic sensory stimuli which are so obscure during the day (cf. p. 151 above); hence the over-fantastic theory of Scherner and the perhaps too matter-of-fact theories of Wundt and other physiologists, though otherwise diametrically opposed to each other, are in perfect agreement in their assumptions with regard to dream-sources and dream-stimuli. But whereas, according to the physiological theory, the psychic reaction to the inner physical stimuli becomes exhausted with the arousing of any of the ideas appropriate to these stimuli (as these ideas then, by way of association, call to their aid other ideas, so that on reaching this stage the chain of psychic processes appears to terminate), according to Scherner, on the other hand, the physical stimuli merely supply the psyche with material which it may utilize in fulfilling its phantastic intentions. For Scherner dream-formation begins where, according to the views of other writers, it comes to an end.

What the dream-phantasy does with the physical stimuli cannot, of course, be regarded as purposeful. The phantasy plays a tantalizing game with them, and represents the organic source of the stimuli of the dream in question by any sort of plastic symbolism. Indeed, Scherner holds—though here Volkelt and others differ from him—that the dream-phantasy has a certain favourite symbol for the organism as a whole: namely, the house. Fortunately, however, it does not seem to limit itself to this material; it may also employ a whole series of houses to designate a single organ; for example, very long streets of houses for the intestinal stimulus. In other dreams particular parts of the house may actually represent particular regions of the body, as in the headache-dream, the ceiling of the room (which the dream sees covered with disgusting, toad-like spiders) represents the head.

Quite apart from the symbol of the house, any other suitable object may be employed to represent those parts of the body which excite the dream. "Thus the breathing lungs find their symbol in the flaming stove with its windy roaring, the heart in hollow chests and baskets, the bladder in round, ball-shaped, or simply hollow objects. The man's dream, when due to the sexual stimulus, make the dreamer find in

which will be relaxed during sleep Still more entitled to a role in the dream than a weak and almost unnoticed impression is a vivid impres sion which has been accidentally retarded in its elaboration or intentionally repressed The psychic energy accumulated durin the day by inhibition or suppression becomes the main spring of the dream at night In dreams psy chically suppressed material achieves expres sion

Unfortunately Delage does not pursue this line of thou ht any farther he is able to as cribe only the most insignificant role in our dreams to an independent psychic activity and thus in his theory of dreams he reverts to the prevailin doctrine of a partial slumber of the brain *En somme le reve est le produit de la pensée errante sans but et sans direction se fixant successivement sur les souvenirs qui ont gardé asse d intensité pour se placer sur sa route et l arreter au passage établissant entre eux un lien tantot faible et indecis tantot plus fort et plus serré selon que l activité actuelle du cerveau est plus ou moins abolie par le som meil*

3 In a third group we may include those dream theories which ascribe to the dreaming mind the capacity for and propensity to special psychic activities which in the waking state it is able to exert either not at all or imperfect ly In most cases the manifestation of these activities is held to result in a useful function of dreams The evaluations of dreams by the earlier psychologists fall chiefly within this category I shall content myself however with quoting in their stead the assertion of Burdach to the effect that dreaming is the natural ac tivity of the mind which is not limited by the power of the individuality nor disturbed by self consciousness nor directed by self deter mination but is the vitality of the ensible focus indulging in free play (p 486)

Burdach and others evidently consider this revelling in the free use of its own powers as a state in which the mind refreshes itself and gathers fresh strength for the day s work something indeed after the fashion of a vaca tion Burdach therefore cites with approval the admirable words in which the poet Novalis laud the power of the dream The dream is a bulwark against the regularity and common place character of life a free recreation of the fettered phantasy in which it intermin les all the images of life and interrupts the constant seriousness of the adult by the joyful play of the child Without the dream we should surely grow old earlier so that the dream may be considered if not precisely as a gift from above yet as a delightful exercise a friendly compan ion on our pilgrima e to the grave

The refreshin and healing activity of dreams is even more impressively described by Purkinje (p 456) The productive dreams in particular would perform these functions These are the unconstrained play of the imagination and have no connection with the events of the day The mind is loth to continue the tension of the waking life but wishes to relax it and recuperate from it It creates in the first place conditions opposed to those of the wakin state It cures sadness by joy worry by hope and cheerfully distracting images hatred by love and friendliness and fear by courage and con fidence it appeases doubt by conviction and firm belief and vain expectation by realization Sleep heals many sore spots in the mind which the day keeps continually open by coverin them and guardin them against fresh irritation On this depends in some degree the consoling action of time We all feel that sleep is bene ficial to the psychic life and the vague surmise of the popular consciousness is apparently loth to surrender the notion that dreaming is one of the ways in which sleep bestows its benefits.

The most ori inal and most comprehensive attempt to explain dreaming as a special activity of the mind which can freely unfold itself only in the sleeping state is that made by Scherner in 1861 Scherner s book is written in a heavy and bombastic style and is inspired by an al most intoxicated enthusiasm for the subject, which is bound to repel us unless it can carry us away with it It places so many d fficulties in the way of an analysis that we gladly resort to the clearer and conciser presentation of Scherner s theories made by the philosopher Volkelt From these mystical conglomera tions from all these outbursts of splendour and radiance there indeed flashes and shines an

has directed his attention to this relat onship. For the purposes of our discus on it will suffice merely to glance at t is important subject.

As to the clinical and tiolonical relations between dreams and the psychoses I will re port the following observations as examples H hnbaum assert (ee Krauss) that the first ttack of insanity is frequentl conn cted with a anxiet -dream and that the pre- Sante n re- m to erm m t h the lusive dream that co t ins its e tu explanat r it ma develop sl wl through subsequent dre ms that ha e still to struggle against d ubt In n of de Sanctis s cases an inten el movin dream was ac ompanied by sl ght hysterical attacks, which in the r turn w re followed b an anxi s melancholic state. Fére (cited b Tis) refers t dream which was followed by h sterical paralys s. H re th dream is presen ed a the etiology of mental derangement althou h we should be making a statem t equall con tent with the f cts were we t sa that the first manifestat n of the mental derangeme t occurred in th dream lif tha th disorder fir t br ke throu h i the dream In o h insta ces the morb d symp- tom re in l ded in the dream life or th psy cho s remains onfi ed to the dream lif Thus Thoma e calls o ttention to *anxi ty-d m* ations of ecent dat in wh h beha our of path logical character (ba ed on d lusory h potheses bsessi umpul es) had their origin dreams. Guislain describes a case in which leep was replaced by an int rmittent in anit

W cannot doubt that one da th physician wil oncern himself ot only with the psychol ogy but al o with the psycho-pathology of dreams.

In cases of con alescence from insanity it is often especially obv ous that while the func tions may be healthy by day the dream life may still partake of the psycho s Gregory is said to ha e bee the first to call attention to such cases (*see* Krauss) Macario (cited by Tissie) gives an account of a maniac who a week afte his complete reco ery o ce m re experienced in dreams the flux of deas and the unbridled impulses of his dise e

Concerning the changes which the dream life undergoes in chronic psychotics little research has been undertaken as yet On the other hand early attenti n wa given to the inner relation hip between dream and mental disturbances relations ip which is demon trated by the compl t agreem t f th manifestat ons oc curri in each. According to M ury Cabanis in hi *R p ts d Ph siq e et d Mo al* was the first t call atte tion to this relationship he was f llowed by Lélut, J Moreau and more particularl the philosopher Maine de B ran The comparison between the two s of course lder still. Radestock begins the chapter in which h deals with th ubject by citin a numbe of opin on wh ch i st on the anal gy between insanity and dreaming Kant sa s mewhe Th lunatic is a dream r in the w king st t According to Kra s Insanity is a dream in whi h the enses are aw ke. Schopenhauer terms the dream bri f insanity and insanit lon dream Hagen describes d lirium as a dream lif which i ind cted not by leep but by disease Wundt, in his *Physio- l gische P ychologie* de lares As a matter of f t we urselves m y in dreams experience almost all the man festat ons which we bserve in th sylums for the insane

The specific points f agreement in c nse quence of which ch comparison ommends itself t our judgm t are e um rated by Sp tta wh groups them (ry much as Maury has d n) as f ll ws (1) Suspen i n t least retard t on of lf-c ciousness and con sequ ntly gnorance of th condition as such the impos ibility f a toni hment and a la k of m ral c ct usn s ( ) Modified percep- tion f the sen ory rgans that is percept n is as rul dimin shed in dreams a d greatly enhanced in nsanity (3) Mutual c mb nation of deas e clusively in ord ce with th laws of association and reproduct n hence auto- mat c series-format ons hence gain a l ck f proportion in the rela ions between ideas (ex

The real determi ing cause f the madness.—ED.

the street the upper portion of a clarinet or the mouthpiece of a tobacco pipe or again a piece of fur The clarinet and tobacco pipe represent the approximate form of the male sexual organ while the fur represents the pubic hair In the sexual dreams of the female the tightness of the closed thighs may be symbolized by a narrow courtyard surrounded by houses and the vagina by a very narrow slippery and soft footpath leading through the courtyard upon which the dreamer is obliged to walk in order perhaps to carry a letter to a man (Volkelt p 39) It is particularly noteworthy that at the end of such a physically stimulated dream the phantasy as it were unmasks itself by representing the exciting organ or its function unconcealed Thus the tooth excited dream usually ends with the dreamer taking a tooth out of his mouth

The dream phantasy may however direct its attention not merely to the form of the exciting organ but may even make the substance contained therein the object of symbolization Thus for example the dream excited by the intestinal stimuli may lead us through muddy streets the dream due to stimuli from the bladder to foaming water Or the stimulus as such the nature of its excitation and the object which it covets are represented symbolically Or again the dream ego enters into a concrete association with the symbolization of its own state as for example when in the case of painful stimuli we struggle desperately with vicious dogs or raging bulls or when in a sexual dream the dreamer sees herself pursued by a naked man Disregarding all the possible prolixity of elaboration a phantastic symbolizing activity remains as the central force of every dream Volkelt in his fine and enthusiastic essay attempted to penetrate still further into the character of this phantasy and to assign to the psychic activity thus recognized its position in a system of philosophical ideas which however remains altogether too difficult of comprehension for anyone who is not prepared by previous training for the intuitive comprehension of philosophical modes of thought

Scherner attributes no useful function to the activity of the symbolizing phantasy in dreams In dreams the psyche plays with the stimuli which are offered to it One might conjecture that it plays in a mischievous fashion And we might be asked whether our detailed consideration of Scherner s dream theory the arbitrariness of which and its deviation from the rules of all forms of research are only too obvious can lead to any useful results We might fitly reply that to reject Scherner s theory without previous examination would be imposing too arrogant a veto This theory is based on the impressions produced by his dreams on a man who paid close attention to them and who would appear to be personally very well equipped for tracing obscure psychic phenomena Furthermore it treats of a subject which (though rich in its contents and relations) has for thousands of years appeared mysterious to humanity and to the elucidation of which science strictly so called has as it confesses contributed nothing beyond attempting—in uncompromising opposition to popular sentiment—to deny its content and significance Finally let us frankly admit that it seems as though we cannot very well avoid the phantastical in our attempts to explain dreams We must remember also that there is such a thing as a phantasy of ganglion cells the passage cited (p 87) from a sober and exact investigator like Binz which describes how the dawn of awakening floods the dormant cell masses of the cerebral cortex is not a whit less fanciful and improbable than Scherner s attempts at interpretation I hope to be able to demonstrate that there is something real underlying these attempts though the phenomena which he describes have been only vaguely recognized and do not possess the character of universality that should entitle them to be the basis of a theory of dreams For the present Scherner s theory of dreams in contrast to the medical theory may perhaps lead us to realize between what extremes the explanation of dream life is still unsteadily vacillating

H *The Relation between Dreams and Mental Diseases*

When we speak of the relation of dreams to mental derangement we may mean three different things (1) aetiological and clinical relations as when a dream represents or initiates a psychotic condition or occurs subsequently to such a condition (2) changes which the dream life undergoes in cases of mental disease (3) inner relations between dreams and psychoses analogies which point to an intimate relationship These manifold relations between the two series of phenomena were in the early days of medical science—and are once more at the present time—a favourite theme of medical writers as we may learn from the literature on the subject collated by Spitta Radestock Maury and Tissié Recently Sante de Sanctis

dream-problems to cover the period between the first appearance of this book and the publication of the second edition. This justifica tion may not seem very atisfactory t the reade none the less to me t wa decisive. The m tives whi h ind ced me to summarize the treatment of dreams in the literature of the subject ha e been exhausted by the forego.n introduction to have contin ed th.s would ha e cost m great deal of effort and would not have been particularly useful r instru tive For the interval in question—a period of nine years—has yielded n thing new or valu able as re-ards the conception of dreams, either in actual m t rial or in novel poin.s of view In most f the literature which h.s ap peared sin e the publication of my own work the litt r has not been mentioned or discu.sed it has, of ourse received the lea.t ttention from the so-called research wo k rs on dreams who ha e thus aff rded a brillian ex ampl of the ersion to learning anythin new so ch.racteri.ti of the ci ntist. *Les save ts ne sont pas curieux* ..aid the c ffer Anat le Fra.ce If there were uch thing in scie ce as the right f revenge I in my turn hould be justified in ..moring the literature which has ap peared sinc the publicati n f this book. The few reviews wh.ch have appeared in th. sc en ti.c journals are so full f misconcept ons and m onl pos.ible

touch on my own treatment of the dream problems A young philosopher H Swoboda, who has en ured to extend W Fliess s discovery of b ological periodicity (in series of twenty three and twenty-eight days) to the psychic field, has produced an imaginative essay in which among other thin.. he has used this key to sol e the riddle of dreams. S ch a solut on, however would be an inade quate estimat of the si.nificance of dreams The material content of dreams would be ex plained by the c incidence of all those mem ories which, on th. ni ht of the dream com plete ne of these b ological periods for the first or the nth time A personal communica tion of the author's led me to assume that he himself no l nger took this theory very serious ly But it seems that I was mistaken in this co clusion I shall record in another place some observations made with reference to Sw boda s thesis which did not howe.er yield con .ncin results. It ga e me far .reater pleasure to find by chance in an unexpected quarter a conception of the dream which is in compl te a.reement with the essence of my own. The relevant dates preclude the possibil ity that this con ept on was influenced by read ing my book I must therefore hail this as the only demon.trable concurrence with the essen tials of my theory of dreams to be found in the literature f th subject. The book which con tains the pa.sage that I have in mind was pub li.hed (in ts seco d edition) in 19 o by Lyn keus under the title *Phan.asien ei s Rea.is ten*

aggerations phanta ms) and the results of all this (4) Changes in—for example inversions of—the personality and sometimes of the idio syncrasies of the character (perversities)

Radestock adds a few additional data con cerning the analogous nature of the material of dreams and of mental derangement The greatest number of hallucinations and illusions are found in the sphere of the senses of sight and hearing and general sensation As in dreams the fewest elements are supplied by the senses of smell and taste The fever patient like the dreamer is assailed by reminiscences from the remote past what the waking and healthy man seems to have forgotten is recol lected in sleep and in disease The analogy be tween dreams and the psychoses receives its full value only when like a family resem blance it is extended to the subtler points of mimicry and even the individual peculiarities of facial expression

To him who is tortured by physical and mental sufferings the dream accords what has been denied him by reality to wit physical well being and happiness so too the insane see radiant images of happiness eminence and wealth The supposed possession of estates and the imaginary fulfilment of wishes the denial or destruction of which have actually been a psychic cause of the insanity often form the main content of the delirium The woman who has lost a dearly beloved child experiences in her delirium the joys of maternity the man who has suffered reverses of fortune deems himself immensely wealthy and the jilted girl sees herself tenderly beloved

(This passage from Radestock is an abstract of a brilliant exposition of Griesinger s (p 111) which reveals with the greatest clarity *wish fulfilment* as a characteristic of the imagina tion common to dreams and to the psychoses My own investigations have taught me that here is to be found the key to a psychological theory of dreams and of the psychoses)

Absurd combinations of ideas and weakness of jud ment are the main characteristics of the dream and of insanity The *over estima tion* of one s own mental capacity which ap pears absurd to sober judgment is found alike in both and the *rapid flux of imaginings* in the dream corresponds to the *flux of ideas* in the psychoses Both are devoid of any *measure of time* The *splitting of the personality* in dreams which for instance distributes one s own knowledge between two persons one of whom the strange person corrects one s own ego in the dream entirely corresponds with the well known splitting of the personality in hallucina tory paranoia the dreamer too hears his own thoughts expressed by strange voices Even the constant delusive ideas find their analogy in the stereotyped and recurring pathological dream (*reve obsédant*) After recovering from delirium patients not infrequently declare that the whole period of their illness appeared to them like an uncomfortable dream indeed they inform us that sometimes during their illness they have suspected that they were only dream ing just as often happens in the sleep-dream

In view of all this it is not surprisin that Radestock should summarize his own opinion, and that of many others in the following words Insanity an abnormal morbid phe nomenon is to be regarded as an enhancement of the periodically recurring normal dream state (p 228)

Krauss attempted to base the relationship between the dream and insanity upon their aetiology (or rather upon the sources of ex citation) thus perhaps making the relation ship even more intimate than was possible on the basis of the analogous nature of the phe nomena manife ted According to him the fun damental element common to both is as we have already learned the organically condi tioned sensation the sensation of physical stimuli the general sensation arising out of contributions from all the organs (cf Peisse cited by Maury p 52)

The undeniable agreement between dreams and mental derangement extending even to characteristic details constitutes one of the strongest confirmations of the medical theory of dream life according to which the dream is represented as a usele s and disturbing proc ess and as the expression of a diminished psy chic activity One cannot expect for the pres ent to derive the final explanation of the dream from the psychic derangements since as is well known our understanding of the origin of the latter is still highly unsatisfactory It is very probable however that a modified con ception of the dream must also influence our views regarding the inner mechanism of mental disorders and hence we may say that we are working towards the explanation of the psy choses when we endeavour to elucidate the mystery of dreams

ADDENDUM 1909

I shall have to justify my elf for not ex tending my summary of the literature of

dream-problems to cover the period between the first appearance of this book and the publication of the second edition. This justification may not seem very satisfactory to the reader; none the less, to me it was decisive. The motives which induced me to summarize the treatment of dreams in the literature of the subject have been exhausted by the foregoing introduction; to have continued this would have cost me a great deal of effort and would not have been particularly useful or instructive. For the interval in question—a period of nine years—has yielded nothing new or valuable as regards the conception of dreams, either in actual material or in novel points of view. In most of the literature which has appeared since the publication of my own work the latter has not been mentioned or discussed; it has, of course, received the least attention from the so-called "research workers" on dreams, who have thus afforded a brilliant example of the aversion to learning anything new so characteristic of the scientist. "*Les savants ne sont pas curieux*,"* said the scoffer Anatole France. If there were such a thing in science as the right of revenge, I in my turn should be justified in ignoring the literature which has appeared since the publication of this book. The few reviews which have appeared in the scientific journals are so full of misconceptions and lack of comprehension that my only possible answer to my critics would be a request that they should read this book over again—or perhaps merely that they should read it!

In the works of those physicians who make use of the psycho-analytic method of treatment a great many dreams have been recorded and interpreted in accordance with my directions. In so far as these works go beyond the confirmation of my own assertions I have noted their results in the context of my exposition. A supplementary bibliography at the end of this volume comprises the most important of these new publications. The comprehensive work on the dream by Sante de Sanctis, of which a German translation appeared soon after its publication, was produced simultaneously with my own, so that I could not review his results, nor could he comment upon mine. I am sorry to have to express the opinion that this laborious work is exceedingly poor in ideas, so poor that one could never divine from it the possibility of the problems which I have treated in these pages.

I can think of only two publications which touch on my own treatment of the dream problems. A young philosopher, H. Swoboda, who has ventured to extend W. Fliess's discovery of biological periodicity (in series of twenty-three and twenty-eight days) to the psychic field, has produced an imaginative essay,[1] in which, among other things, he has used this key to solve the riddle of dreams. Such a solution, however, would be an inadequate estimate of the significance of dreams. The material content of dreams would be explained by the coincidence of all those memories which, on the night of the dream, complete one of these biological periods for the first or the nth time. A personal communication of the author's led me to assume that he himself no longer took this theory very seriously. But it seems that I was mistaken in this conclusion. I shall record in another place some observations made with reference to Swoboda's thesis, which did not, however, yield convincing results. It gave me far greater pleasure to find by chance, in an unexpected quarter, a conception of the dream which is in complete agreement with the essence of my own. The relevant dates preclude the possibility that this conception was influenced by reading my book; I must therefore hail this as the only demonstrable concurrence with the essentials of my theory of dreams to be found in the literature of the subject. The book which contains the passage that I have in mind was published (in its second edition) in 1900 by Lynkeus under the title *Phantasien eines Realisten*.[2]

ADDENDUM 1914

The above *apologia* was written in 1909. Since then, the state of affairs has certainly undergone a change; my contribution to the interpretation of dreams is no longer ignored in the literature of the subject. But the new situation makes it even more impossible to continue the foregoing summary. *The Interpretation of Dreams* has evoked a whole series of new contentions and problems, which have been expounded by the authors in the most varied fashions. But I cannot discuss these works until I have developed the theories to which their authors have referred. Whatever has appeared to me as valuable in this recent literature I

have accordingly reviewed in the course of the following exposition

II The Method of Dream Interpretation

The Analysis of a Specimen Dream

THE epigraph on the title page of this volume indicates the tradition to which I prefer to ally myself in my conception of the dream I am proposing to show that dreams are capable of interpretation and any contributions to the solution of the problems which have already been discussed will emerge only as possible by products in the accomplishment of my special task On the hypothesis that dreams are sus ceptible of interpretation I at once find myself *in disagreement with the prevailing doctrine of* dreams—in fact with all the theories of dreams excepting only that of Scherner for *to interpret a dream* is to specify its *meaning* to replace it by something which takes its posi tion in the concatenation of our psychic activi ties as a link of definite importance and value But as we have seen the scientific theories of the dream leave no room for a problem of dream interpretation since in the first place accordin to these theories dreaming is not a psychic activity at all but a somatic process which makes itself known to the psychic ap paratus by means of symbols Lay opinion has always been opposed to these theories It as serts its privilege of proceeding illogically and althou h it admits that dreams are incompre hensible and absurd it cannot summon up the courage to deny that dreams have any signifi cance Led by a dim intuition it seems rather to assume that dreams have a meaning albeit a hidden one that they are intended as a substi tute for some other thought process and that we have only to disclose this substitute cor rectly in order to discover the hidden meaning of the dream

The unscientific world therefore has always endeavoured to *interpret* dreams and by ap plying one or the other of two essentially differ ent methods The first of these methods en visages the dream content as a whole and seeks to replace it by another content which is intelligible and in certain re pects analogous This is symbolic dream interpretation and of course it goes to pieces at the very outset in the ca e of tho e dreams which are not only unintelligible but confused The construction which the biblical Joseph placed upon the dream of Pharaoh furnishes an example of this method The seven fat kine after which came seven lean ones that devoured the former were a symbolic substitute for even years of famire in the land of Egypt which accordin to the *prediction were to consume all the surplus that* seven fruitful years had produced Mo t of the artificial dreams contrived by the poets are intended for some such symbolic interpretation, for they reproduce the thou ht conceived by the poet in a guise not unlike the disgui e which we are wont to find in our dreams

The idea that the dream concerns itself chief ly with the future whose form it surmises in advance—a relic of the prophetic significance with which dreams were once inve ted—now becomes the motive for translatin into the future the meaning of the dream which has been found by means of symbolic *interpreta tion*

A demonstration of the manner in which one arrives at such a symbolic interpretation can not of course be given Success remains a matter of ingenious conjecture of direct intui tion and for this reason dream interpretation has naturally been elevated into an art which seems to depend upon extraordinary gifts The second of the two popular methods of dream interpretation entirely abandons such claims It might be described as the *cipher method* since it treats the dream as a kind of secret code in which every sign is *translated* into another sign of known meaning according to an established key For example I have *dreamt of a letter and also of a funeral* or the like I consult a dream book and I find that letter is to be translated by vexation and funeral by engagement It now remains to establish a connection which I am again to as sume as pertaining to the future by means of the rigmarole which I have deciphered An in teresting variant of this cipher procedure a variant in which its character of purely me

Breuer to the effect that in these *structures* regarded as morbid symptoms solution and treatment go hand in hand Where it has been *possible to trace a pathological idea back to* those elements in the psychic life of the patient to which it owed its origin this idea has crumbled away *and the patient has been relieved of* it In view of the failure of our other therapeutic efforts and in the face of the mysterious *character of the e pathological conditions* it seemed to me tempting in spite of all the difficulties to follow the method initiated by Breuer *until* a complete elucidation of the subject had been achieved I shall have occasion elsewhere to give a detailed account of the form which the technique of this procedure has finally assumed and of the results of my efforts In the course of these psycho analytic studies I happened upon the question of dream interpretation My patients after I had pled ed them to inform me of all the ideas and thou hts which occurred to them in connection with a given theme related their dreams and thus taught me that a dream may be interpolated in the psychic concatenation which may be followed backwards from a pathological idea into the patient s memory The next step was to treat the dream itself as a symptom and to apply to it the method of interpretation which had been worked out for such symptoms

For this a certain psychic preparation on the part of the patient is necessary A twofold effort is made to stimulate his attentiveness in respect of his psychic perceptions and to eliminate the critical spirit in which he is ordinarily in the habit of viewin such thou hts as come to the surface For the purpose of self observation with concentrated attention it is advantageous that the patient should take up a restful position and close his eyes he must be explicitly instructed to renounce all criticism of the thought formations which he may perceive He must *also be told that the success of the* psycho analysis depends upon his noting and communicatin everything that passes through his mind *and that he must not allow himself* to suppress one idea because it seems to him unimportant or irrelevant to the subject or *another because it seems nonsensical* He must

idea or the like it will be because h p w himself to be critical of them

St d e uber Hy te e 1895 [C mp e p g 6 abo]

I have *noticed in the course of* my psychoanalytical work that the psychological tate of a man in an attitude of reflection is entirely *different from that of* a man who i observing his psychic processes In reflection there is a greater play of psychic activity than in the most attentive self observation this is shown even by the tense attitude and the wrinkled brow of the man in a state of reflection, as oppo ed to the mimic tranquillity of the man observin himself In both cases there must be concentrated attention but the reflective man makes use of his critical faculties with the result that he rejects some of the thoughts which rise into consciousness after he has become aware of them and abruptly interrupts others so that he does not follow the lines of thou ht which they would otherwise open up for him while in respect of yet other thoughts he is able to behave in such a manner that they do not become conscious at all—that is to say they are suppressed before they are perceived In self observation on the other hand he has but one task—that of suppressing criticism if he succeeds in doin this an unlimited number of thoughts enter his consciousness which would otherwise have eluded his grasp With the aid of the material thus obtained—*material* which is new to the self observer—it is possible to achieve the interpretation of pathological ideas and also that of dream *formations* As will be seen the point is to induce a psychic state which is in some degree analogous as regards the distribution of psychic energy (mobile attention) to the state of the mind before fallin asleep—and also of course to the h pnotic state On falling asleep *the undesired ideas* emerge owing to the slackening of a certain arbitrary (and of course also critical) action which is *allowed to influence the trend* of our ideas we are accustomed to peak of fatigue as the reason of this lackening the *emerging undesired ideas are chan ed* into visual and auditory ima es In the condition which it utilized for the analysis of dreams and pathological *ideas this activity is purpo ely* and deliberately renounced and the psychic energy thus saved (or some part of it) is employed in attentively *tracking* the undesired thoughts which now come to the surface—thou hts which retain their identity as ideas (in which the condition differs from the state of falling asleep) *Undesired ideas are thus changed into desi ed ones*

There are many people who do not seem to find it easy to adopt the required attitude to-

ward the apparently "freely rising" ideas and to renounce the criticism which is otherwise applied to them. The "undesired ideas" habitually evoke the most violent resistance which seeks to prevent them from coming to the surface. But if we may credit our great poet philosopher Friedrich Schiller the essential condition of poetical creation includes a very similar attitude. In a certain passage in his correspondence with Korner (for the tracing of which we are indebted to Otto Rank) Schiller replies in the following words to a friend wh

i — power "The

es

an

observation, and illustrate it by an allegory Apparently it is not good—and indeed it hinders the creative work of the mind—if the intellect examines too closely the ideas already pouring in, as it were at the gates Regarded

— by — — first

be capable of furnishing very serviceable link. The intellect cannot judge all these ideas unless it can retain them until it has considered them in connection with these other ideas. In the case of a creative mind, it seems to me, the intellect has withdrawn its watchers from the gates and the ideas rush in pell mell, and only then does it review and inspect the multitude You worthy critics or whatever you may call yourselves are ashamed or afraid of the momentary and passing madness which is found in all real creators the longer or shorter duration of which distinguishes the thinking artist from the dreamer Hence your complaints of unfruitfulness for you reject too soon and discriminate too severely" (letter of December 1 1788)

And yet, such a withdrawal of the watchers from the gates of the *intellect* as Schiller puts it, such a translation into the condition of uncritical self-observation, is by no means difficult.

Most of my patients accomplish it after my first instructions I myself can do so very completely if I assist the process by writing down the ideas that flash through my mind. The quantum of psychic energy by which the critical activity is thus reduced, and by which the intensity of self-observation may be increased, varies considerably according to the subject matter upon which the attention is to be fixed.

The first step in the application of this procedure teaches us that one cannot make the dream as a whole the object of one's attention but only the individual components of its content. If I ask a patient who is as yet unpractised What occurs to you in connection with this dream? he is unable as a rule, to fix upon anything in his psychic field of vision. I must first dissect the dream for him then in connection with each fragment, he gives me a number of ideas which may be described as the *thought behind* this part of the dream In this first and important condition, then the method of dream interpretation which I employ diverges from the popular historical and legendary method of interpretation by symbolism and approaches more nearly to the second or *cipher method* Like this it is an interpretation in detail, not *en masse* Like this it conceives the dream from the outset, as something built up as a conglomerate of psychic formations.

In the course of my psycho-analysis of neurotics I have already subjected perhaps more than a thousand dreams to interpretation, but I do not wish to use this material now as an introduction to the theory and technique of dream interpretation. For quite apart from the fact that I should lay myself open to the objection that these are the dreams of neuropaths so that the conclusions drawn from them would not apply to the dreams of healthy persons there is another reason that impels me to reject them. The theme to which these dreams point is of course always the history of the malady that is responsible for the neurosis. Hence every dream would require a very long introduction and an investigation of the nature and aetiological conditions of the psychoneuroses matters which are in themselves novel and exceedingly strange and which would therefore distract attention from the dream-problem proper My purpose is rather to prepare the way by the solution of the dream problem for the solution of the more difficult problems of the psychology of the neuroses. But if I eliminate the dreams of neurotics which constitute my principal material I cannot be too fastidious in my treatment of the rest. Only those dreams are left which have been incidentally related to me by healthy persons of my acquaintance or which I find given as examples in the literature of dream life Unfortunately in all these dreams I am deprived of the analysis without which I cannot find the meaning of the dream My mode of procedure is of course, less easy than that of

Breuer to the effect that in these structures *regarded as morbid symptoms solution and* treatment go hand in hand Where it has been *possible to trace a pathological idea back to* those elements in the psychic life of the patient *to which it owed its origin this idea has crum* bled away and the patient has been relieved of *it In view of the failure of our other therapeu* tic efforts and in the face of the mysterious character of these *pathological* conditions it seemed to me tempting in spite of all the diffi culties to follow the method initiated by Breuer until a complete elucidation of the subject had been achieved I shall have occasion elsewhere to give a detailed account of the form which the technique of this procedure has finally as sumed and of the results of my efforts In the course of these psycho analytic studies I hap pened upon the question of dream interpreta tion My patients after I had pledged them to inform me of all the ideas and thoughts which occurred to them in connection with a given theme related their dreams and thus taught me that a dream may be interpolated in the psychic concatenation which may be followed backwards from a pathological idea into the patient s memory The next step was to treat the dream itself as a symptom and to apply to it the method of interpretation which had been worked out for such symptoms

For this a certain psychic preparation on the part of the patient *is necessary A twofold effort* is made to stimulate his attentiveness in re *spect of his psychic perceptions and to elimi* nate the critical spirit in which he is ordinarily *in the habit of viewin such thoughts as come* to the surface For the purpose of self observa *tion with concentrated attention it is advan* tageous that the patient should take up a rest ful position and close his eyes he must be ex plicitly instructed to renounce all criticism of the thought formations which he may perceive He must also be told that the success of the psycho analysis depends upon his noting and communicating everythin that passes through his mind and that he must not allow himself to suppress one idea because it seems to him unimportant or irrelevant to the subject or another because it seems nonsensical He must preserve an absolute impartiality in respect to his ideas for if he is unsuccessful in finding the desired solution of the dream the obsessional idea or the like it will be because he permits himself to be critical of them

I have noticed in the course of my psycho-analytical work that the psychological state of a man in an attitude of reflection is entirely different from that of a man who is observing his psychic processes In reflection there is a greater play of psychic activity than in the most attentive self observation this is shown even by the tense attitude and the wrinkled brow of the man in a state of reflection as opposed to the mimic tranquillity of the man observing himself In both cases there must be concentrated attention but the reflective man makes use of his critical faculties with the re sult that he rejects some of the thoughts which rise into consciousness after he has become aware of them and abruptly interrupts others so that he does not follow the lines of thought which they would otherwise open up for him while in respect of yet other thoughts he is able to behave in such a manner that they do not become conscious at all—that is to say they are suppressed before they are perceived In self observation on the other hand he has but one task—that of suppressing criticism *if* he succeeds in doing this an unlimited number of thoughts enter his consciousness which would otherwise have eluded his grasp With *the aid of the material thus obtained—material* which is new to the self observer—it is pos *sible to achieve the interpretation of* patholog cal ideas and also that of dream formations *As will be seen the point is to induce a p* ychic state which is in some degree analogous as re*gards the distribution of psychic energy* (mo bile attention) to the state of the mind before *fallin a leep—and also of course* to the hyp notic state On falling asleep the *undesired ideas* emerge owing to the slackening of a cer tain arbitrary (and of course also critical) ac tion which is allowed to influence the trend of our ideas we are accustomed to speak of fa tigue as the reason of this slackening the emerging undesired ideas are changed into vi ual and auditory ima es In the condition which it utilized for the analysis of dreams and patho logical ideas this activity is purposely and de liberately renounced and the psychic energy thus saved (or some part of it) is employed in attentively tracking the undesired thoughts which now come to the surface—thoughts which retain their identity as ideas (in which the condition differs from the state of falling asleep) *Undesired ideas are thus changed into desired ones*

There are many people who do not seem to find it easy to adopt the required attitude to-

St d e ber Hy t 895 [Comp e p g 6 abo]

think surely she doesn't need them.—The mouth then opens wide, and I find a large white spot on the right, and elsewhere I see extensive greyish-white scabs adhering to curiously curled formations, which are evidently analogous to the turbinal bones of the nose.—

She has a dull ess bel— in

c. ceas a ten ion to an inf ated portion of skin on the left shoulder (which I can feel in spite of the dress).... M says: There's no doubt that it's an infection, but it doesn't matter; dysentery will follow and the poison will be eliminated. We know too precisely how the infection originated. My friend O— not long ago gave her, when she was feeling unwell, an injection of a preparation of propyl ... propyls ... propionic acid ... trimethylamin (the formula of which I see before me printed in heavy type). One doesn't give such injections so rashly. Probably too the syringe was not clean.

This dream has an advantage over many others. It is at once obvious to what events of the preceding day it is related, and of what subject it treats. The preliminary statement explains these matters. The news of Irma's health which I had received from Otto, and the clinical history which I was writing late into the night, had occupied my psychic activities even during sleep. Nevertheless, no one who had read the preliminary report, and had knowledge of the content of the dream, could guess what the dream signified. No do I myself know. I am puzzled by the morbid symptoms of which Irma complains in the dream, for they are not the symptoms for which I treated her. I smile at the nonsensical idea of an injection of propionic acid, and at Dr M's attempt at consolation. Towards the end the dream seems more obscure and quicker in tempo than at the beginning. In order to learn the significance of all these details I resolve to undertake an exhaustive analysis.

Analysis

The hall—a number of guests, whom we are receiving. We were living that summer at Bellevue, in a isolated house on one of the hills adjoining the Kahlenberg. This house was originally built as a place of entertainment, and therefore has unusually lofty hall-like rooms. The dream was dreamed in Bellevue, a few days before my wife's birthday. During the day my wife had mentioned that she expected several friends, and among them Irma, to come to us as guests for her birthday. My dream, then, anticipates this situation. It is my wife's birthday, and we are receiving a number of people, among them Irma, as guests in the large hall of Bellevue.

I reproach Irma for not having accepted the solution; I say, "If you still have pains, it is really your own fault." I might even have said this while awake; I may have actually said it. At that time I was of the opinion (recognized later to be incorrect) that my task was limited to informing patients of the hidden meaning of their symptoms. Whether they then accepted or did not accept the solution upon which success depended—for that I was not responsible. I am grateful to this error, which, fortunately, has now been overcome, since it made life easier for me at a time when, with all my unavoidable ignorance, I was expected to effect successful cures. But I note that in the speech which I make to Irma in the dream, I am above all anxious that I shall not be blamed for the pains which she still suffers. If it is Irma's own fault, it cannot be mine. Should the purpose of the dream be looked for in this quarter?

Irma's complaints—pains in the neck, abdomen and stomach; she is choked by them. Pains in the stomach belonged to the symptom-complex of my patient, but they were not very prominent; she complained rather of qualms and a feeling of nausea. Pains in the neck and abdomen and constriction of the throat played hardly any part in her case. I wonder why I have decided upon this choice of symptoms in the dream; for the moment I cannot discover the reason.

She looks pale and puffy. My patient had always a rosy complexion. I suspect that here another person is being substituted for her.

I am startled at the idea that I may have overlooked some organic affection. This, as the reader will readily believe, is a constant fear with the specialist who sees neurotics almost exclusively, and who is accustomed to ascribe to hysteria so many manifestations which the physicians treat as organic. On the other hand, I am haunted by a faint doubt—I do not know whence it comes—whether my alarm is altogether honest. If Irma's pains are indeed of

the popular cipher method which translates the given dream content by reference to an established key I on the contrary hold that the same dream content may conceal a different meaning in the case of different persons or in different connections I must therefore re ort to my own dreams as a source of abun dant and convenient material furnished by a person who is more or less normal and con taining references to many incidents of every day life I shall certainly be confronted with doubts as to the trustworthiness of these *self analyses* and it will be said that arbitrariness is by no means excluded in such analyses In my own judgment conditions are more likely to be favourable in self observation than in the observation of others in any case it is permissible to investigate how much can be accomplished in the matter of dream interpre tation by means of self analysis There are other difficulties which must be overcome in my own inner self One has a comprehensible aversion to exposing so many intimate details of one s own psychic life and one does not feel secure against the misinterpretations of strangers But one must be able to transcend such considerations *Tout psychologiste* writes Delbœuf *est obligé de faire l aveu meme de ses faiblesses s il croit par là jeter du jour sur quelque problème obscur* And I may assume for the reader that his initial in terest in the indiscretions which I must commit will very soon give way to an exclusive engross ment in the psychological problems elucidated by them

I shall therefore select one of my own dreams for the purpose of elucidating my method of interpretation Every such dream necessitates a preliminary statement so that I must now beg the reader to make my interests his own for a time and to become absorbed with me in the most trifling details of my life for an interest in the hidden significance of dreams imperatively demands just such a transference

PRELIMINARY STATEMENT

In the summer of 1895 I had treated psycho-analytically a young lady who was an intimate friend of mine and of my family It will be un derstood that such complicated relations may excite manifold feelings in the physician and especially the psychotherapist The personal interest of the physician is greater but his authority less If he fails his friendship with the patient s relatives is in dan er of bein un dermined In this case however the treatment ended in partial success the patient was cured of her hysterical anxiety but not of all her so-matic symptoms At that time I was not yet quite sure of the criteria which denote the final cure of an hysterical case and I expected her to accept a solution which did not eem accept able to her In the midst of this disa reement we discontinued the treatment for the summer holidays One day a younger colleague one of my most intimate friends who had visited the patient—Irma—and her family in their coun try residence called upon me I asked him how Irma was and received the reply She is bet ter but not quite well I realize that these words of my friend Otto s or the tone of voice in which they were spoken annoyed me I thought I heard a reproach in the word per haps to the effect that I had promi ed the pa tient too much and—ri htly or wron ly—I at tributed Otto s apparent taking sides again t me to the influence of the patient s relatives who I assumed had never approved of my treatment This disagreeable impression how ever did not become clear to me nor did I speak of it That same evenin I wrote the clinical history of Irma s case in order to give it as though to justify myself to Dr M a mutual friend who was at that time the leading personality in our circle During the ni ht (or rather in the early morning) I had the follow in dream which I recorded immediately after waking

DREAM OF JULY 23—24 1895

A great hall—a number of guests whom we are receiving—among them Irma whom I im mediately take aside as though to answer her letter and to reproach her for not yet accepting the solution I say to her If you still have pains it is really only your own fault —She answers If you only knew what pains I have now in the throat stomach and abdomen—I am choked by them I am startled and look at her She looks pale and puffy I think that after all I must be overlooking some organic affec tion I take her to the window and look into her throat She offers some resistance to this like a woman who has a set of false teeth I

E ry psy hol g t s obl ged t dm t e h h m h w

Th th f t d m wh ch I s bjected to an h t e t rp tat o

case of a woman patient and hastily turned for assistance to my older and more experienced colleague. The fact that I really had this case in mind is confirmed by a subsidiary circumstance. The patient, who succumbed to the toxic effects of the drug, bore the same name as my eldest daughter. I had never thought of this until now, but now it seems to me almost like a retribution of fate—as though the substitution of persons had to be continued in another sense: this Matilda for that Matilda; an eye for an eye, a tooth for a tooth. It is as though I were seeking every opportunity to reproach myself for a lack of medical conscientiousness.

Dr. M. is pale; his chin is shaven, and he limps. Of this so much is correct, that his unhealthy appearance often arouses the concern of his friends. The other two characteristics must belong to another person. An elder brother living abroad occurs to me, for he, too, shaves his chin, and if I remember him rightly, the M. of the dream bears on the whole a certain resemblance to him. And some days previously the news arrived that he was limping on account of an arthritic affection of the hip. There must be some reason why I fuse the two persons into one in my dream. I remember that, in fact, I was on bad terms with both of them for similar reasons. Both had rejected a certain proposal which I had recently made them.

My friend Otto is now standing next to the patient, and my friend Leopold examines her and calls attention to a dulness low down on the left side. My friend Leopold also is a physician, and a relative of Otto's. Since the two practice the same speciality, fate has made them competitors, so that they are constantly being compared with one another. Both of them assisted me for years, while I was still directing a public clinic for neurotic children. There, scenes like that reproduced in my dream had often taken place. While I would be discussing the diagnosis of a case with Otto, Leopold would examine the child anew and make an unexpected contribution towards our decision. There was a difference of character between the two men like that between Inspector Bräsig and his friend Karl. Otto was remarkably prompt and alert; Leopold was slow and thoughtful, but thorough. If I contrast Otto and the cautious Leopold in the dream I do so apparently in order to extol Leopold. The comparison is like that made above between the disobedient patient Irma and her friend, who was believed to be more sensible. I now become aware of one of the tracks along which the association of ideas in the dream proceeds: from the sick child to the children's clinic. Concerning the dulness low on the left side, I have the impression that it corresponds with a certain case of which all the details were similar, a case in which Leopold impressed me by his thoroughness. I thought vaguely, too, of something like a metastatic affection, but it might also be a reference to the patient whom I should have liked to have in Irma's place. For this lady, as far as I can gather, exhibited symptoms which imitated tuberculosis.

An infiltrated portion of skin on the left shoulder. I know at once that this is my own rheumatism of the shoulder, which I always feel if I lie awake long at night. The very phrasing of the dream sounds ambiguous: *Something which I can feel, as he does, in spite of the dress.* "Feel on my own body" is intended. Further, it occurs to me how unusual the phrase *infiltrated portion of skin* sounds. We are accustomed to the phrase "an infiltration of the upper posterior left"; this would refer to the lungs, and thus once more to tuberculosis.

In spite of the dress. This, to be sure, is only an interpolation. At the clinic the children were of course examined undressed; here we have some contrast to the manner in which adult female patients have to be examined. The story used to be told of an eminent physician that he always examined his patients through their clothes. The rest is obscure to me; I have, frankly, no inclination to follow the matter further.

Dr. M. says: "It's an infection, but it doesn't matter; dysentery will follow, and the poison will be eliminated." This at first seems to me ridiculous; nevertheless, like everything else, it must be carefully analysed; more closely observed it seems after all to have a sort of meaning. What I had found in the patient was a local diphtheritis. I remember the discussion about diphtheritis and diphtheria at the time of my daughter's illness. Diphtheria is the general infection which proceeds from local diphtheritis. Leopold demonstrates the existence of such a general infection by the dulness, which also suggests a metastatic focus. I believe, however, that just this kind of metastasis does not occur in the case of diphtheria. It reminds me rather of pyaemia.

It doesn't matter is a consolation. I believe it fits in as follows: The last part of the dream

organic origin it is not my duty to cure them My treatment of course removes only hysterical pains It seems to me in fact that I wish to find an error in the diagnosis for then I could not be reproached with failure to effect a cure

I take her to the window in order to look into her throat She resists a little like a woman who has false teeth I think to myself she does not need them I had never had occasion to inspect Irma s oral cavity The incident in the dream reminds me of an examination made some time before of a governess who at first produced an impression of youthful beauty but who upon opening her mouth took certain measures to conceal her denture Other memories of medical examinations and of petty secrets revealed by them to the embarrassment of both physician and patient associate themselves with this case — She surely does not need them is perhaps in the first place a compliment to Irma but I suspect yet another meaning In a careful analysis one is able to feel whether or not the *arrière pensées* which are to be expected have all been exhausted The way in which Irma stands at the window suddenly reminds me of another experience Irma has an intimate woman friend of whom I think very highly One evening on paying her a visit I found her at the window in the position reproduced in the dream and her physician the same Dr M declared that she had a *diphtheritic membrane The person of Dr M* and the membrane return indeed in the course of the dream Now it occurs to me that during *the past few months I have had every reason* to suppose that this lady too is hysterical Yes *Irma herself betrayed the fact to me But what do I know of her condition? Only the one* thing that like Irma in the dream she suffers from hysterical choking Thus in the dream I have replaced *my patient by her friend Now* I remember that I have often played with the supposition that this lady too might ask me to *relieve her of her symptoms But even at* the time I thought it improbable since she is extremely reserved She *resists* as the dream shows *Another explanation might be that she does not need it* in fact until now she has shown herself strong enough to master her condition without outside *help Now only a few* features remain which I can assign neither to Irma nor to her friend pale puffy false teeth The false teeth led *me to the governess* I now feel inclined to be satisfied with bad teeth. Here another person to whom these features may allude occurs to me She is not my patient and I do not wish her to be my patient, for I have noticed that she is not at her ease with me and I do not consider her a docile patient She is generally pale and once when she had not felt particularly well she was *puffy* I have *thus compared my patient* Irma with two others who would likewise resist treatment What is the meaning of the fact that I have exchanged her for her friend in the dream? Perhaps that I wish to exchan e her either her friend arouses in me stron er sympathies or I have a higher regard for her intelligence For I consider Irma foolish because she does not accept my solution The other woman would be more sensible and would thus be more likely to yield *The mouth then opens readily* she would tell more than Irma

What I see in the throat a white spot and scabby turbinal bones The white spot recalls diphtheria and thus Irma s friend but it also recalls the grave illness of my eldest daughter two years earlier and all the anxiety of that unhappy time The scab on the turbinal bones reminds me of my anxiety concerning my own health At that time I frequently used cocaine in order to suppress distressing swellings in the nose and I had heard a few days previously that a lady patient who did likewise had contracted an extensive necrosis of the nasal mucous membrane In 1885 it was I who had recommended the use of cocaine and I had been gravely reproached in consequence. A dear friend who had died before the date of this dream had hastened his end by the misuse of *this remedy*

I quickly call Dr M who repeats the examination This would simply correspond to the *position which M occupied among* us But the word *quickly* is striking enough to demand a special examination It reminds me of a sad *medical experience By continually* prescribing a drug (sulphonal) which at that time was still considered harmless I was once responsible *for a condition of acute poisoning* in the

chemistry

Trim th lam In the dream I see the chemical formula f thi sub tance—which at ll events is ev dence of a great eff rt on the part f my mem ry—a d the f rmula s even printed n hea y type as though t di tinguish it from the co text s something of particular importance And where does trim thylamin thu fo ced on my atte tion, lead me? To a con ersati n with an ther friend who fo years has bee famili r with all my g rminat ing deas a d I with his. At that time he had just inf rmed me of c rtain deas concerning a exual chemistry and had mentio ed among others, that h thought he h d found in trimeth ylamin one of the produ t f sexual metabolism This substance th s leads me t sexu ality the fact r to which I ttrib te th great est gnificance in respect of th n n f these nervous ff ct ons whi h I am trying to cure My pat ent Irm is y ung widow if I am requi ed to excuse my fail e t cur h I hall pe haps d best t r fe t th s o dition whi h h admirers would be glad t terminate. But in what a singula fa h o such dream is fitted to eth Th frie d wh in my dream be mes my patient in Irma s place is likewise a young widow

I surmise why t s that th formula f tri meth lamin is so in t tent in the dream So many important thi gs are centered about this one word trim thylamin is an allu not merely to the all important factor of sexuality but lso t friend whose sympathy I remem be w th satisf cti whene r I feel solated in my opini ns And thi friend who plays su h a large part in my lif will he not appe et again in the concatenat o of d as peculiar to th. dream? Of course he has a special kn wl edge f the result of affections of the nose and th nuses and has revealed to scien e everal highly remarkabl rel tions between th t binal bones and the female sexual gans (The three curl format ons in Irma throat) I g t him t xamine Irm in rd t d termine whethe her gastri pa ns were of nasal origin. But he himself suffers f om suppurat thin itis which gi es m concern, and to this pe haps there is an allusion in pyaemia which hovers before me in the metastasis of the dream

O e doesn't g ve such injections so ashly Here the reproach of ra hness is hurled di rectly at my friend Otto I believe I had some such thought in the afternoo when he seemed to nd c te, by word and look, that he had taken sides against me It was perhaps "How easily he is influenced how irrespons blv he pron unces judgment Further the above en te ce points once mo e to my decea ed friend who irrespon bl resort d to cocai e jec tions As I ha e said I had n t intended that injections of the dru hould be taken I note that n reproaching Otto I o ce more touch upon the story of the unf rtunate Matilda which was the pretext for the same reproach against me Here obvio ly I am collecting examples of my con cientiou ness and also of the reverse

An

morphia daily At present he is in the country and I ha e heard that he is sufferin from phl b tis I immediately thought that this might be a ca e f infiltration caused by a dirty syringe It s my p de that in tw years I ha e n t given h r ingle infiltration I am always careful of course to see that the syr inge s perfectly clean Fo I am conscientious From th phl b t s I return to my wife wh e suffered from thrombo during a period f pregnancy and n w three related tuations come to the urface in my memory in olvi g my wif Irma, and th dead Matilda whose identity has appa ntly ju tified my puttin thes three pers ns in o e another s places

I ha e now completed the terpretat n of th dre m In the course of this interpretati n I ha t ken great pains to a o d all th no- t ons which must have been su e ted by a ompari on f th dream-c t nt with the dre m th hts h dden behind this content. M wh le the *m a g* of the dream has dawned upo me I ha noted an intention which re lized thr h the d eam and which must ha e been my moti e in d eaming Th dream fulfill se ral wi hes whi h were awak e ed w thi m by the ev ts f the p vi us

Even f I have no as m gh be expected accou t- ed f verythin tha occurred to me in connecti with t e wo k f interp ta on.

has yielded a content to the effect that the patient s sufferings are the result of a serious organic affection I begin to suspect that by this I am only trying to shift the blame from myself Psychic treatment cannot be held responsible for the continued presence of a diphtheritic affection Now indeed I am distressed by the thought of having invented such a serious illness for Irma for the sole purpose of exculpating myself It seems so cruel Accordingly I need the assurance that the outcome will be benign and it seems to me that I made a good choice when I put the words that consoled me into the mouth of Dr M But here I am placing myself in a position of superiority to the dream a fact which needs explanation

But why is this consolation so nonsensical?

Dysentery Some sort of far fetched theoretical notion that the toxins of disease might be eliminated through the intestines Am I thereby trying to make fun of Dr M s remarkable store of far fetched explanations his habit of conceiving curious pathological relations? Dysentery suggests something else A few months ago I had in my care a young man who was suffering from remarkable intestinal troubles a case which had been treated by other colleagues as one of anaemia with malnutrition I realized that it was a case of hysteria I was unwilling to use my psycho therapy on him and sent him off on a sea voyage Now a few days previously I had received a despairing letter from him he wrote from Egypt saying that he had had a fresh attack which the doctor had declared to be dysentery I suspect that the diagnosis is merely an error on the part of an ignorant colleague who is allowing himself to be fooled by the hysteria yet I cannot help reproaching myself for putting the invalid in a position where he might contract some organic affection of the bowels in addition to his hysteria Furthermore dysentery sounds not unlike diphtheria a word which does not occur in the dream

Yes it must be the case that with the consoling prognosis *Dysentery will develop etc* I am making fun of Dr M for I recollect that years ago he once jestingly told a very similar story of a colleague He had been called in to consult with him in the case of a woman who was very seriously ill and he felt obliged to confront his colleague who seemed very hopeful with the fact that he found albumen in the patient s urine His colleague however did not allow this to worry him but answered calmly *That does not matter* my dear sir the albumen will soon be excreted! Thus I can no longer doubt that this part of the dream expresses derision for those of my colleagues who are ignorant of hysteria And as though in confirmation the thought enters my mind Does Dr M know that the appearances in Irma s friend his patient which gave him reason to fear tuberculosis are likewise due to hysteria? Has he recognized this hysteria, or has he allowed himself to be fooled?

But what can be my motive in treating this friend so badly? That is simple enough Dr M agrees with my solution as little as does Irma herself Thus in this dream I have already revenged myself on two persons on Irma in the words *If you still have pains it is your own fault* and on Dr M in the wording of the nonsensical consolation which has been put into his mouth

We know precisely how the infection originated This precise knowledge in the dream is remarkable Only a moment before this we did not yet know of the infection since it was first demonstrated by Leopold

My friend Otto gave her an injection not long ago when she was feeling unwell Otto had actually related during his short visit to Irma s family that he had been called in to a neighbouring hotel in order to give an injection to someone who had been suddenly taken ill Injections remind me once more of the unfortunate friend who poisoned himself with cocaine I had recommended the remedy for internal use only during the withdrawal of morphia but he immediately gave himself injections of cocaine

With a preparation of propyl propyls propionic acid How on earth did this occur to me? On the evening of the day after I had written the clinical history and dreamed about the case my wife opened a bottle of liqueur labelled Ananas which was a present from our friend Otto He had as a matter of fact a habit of making presents on every possible occasion I hope he will some day be cured of this by a wife This liqueur smelt so strongly of fusel oil that I refused to drink it My wife suggested We will give the bottle to the servants and I more prudent objected with the philanthropic remark They shan t be

A m h s m k bl ss nce w th th f m ly m f my p t t Irm

be innocent of Irma s illness, is nevertheless unmistakable

I do n t wish to assert that I have entirely revealed the mean..g of the dream, or that my interpret tion is flawless.

I could still spe d m ch time upon it I could draw further exp..nations from t, and discuss furthe problems which t seems to propound. I can even perceive the po..nts from which further mental associations migh be traced but such consid rations as are always invol ed in every dream of on s wn prevent me from interpreting t farther Those who are overready to co demn such reserve should make the xperiment of trying to be more s raigh forward. For the present I am cont nt with th one fresh disco ery which has just been made If t..e method of dream interpretation here indicated is fo owed t will be found that dreams d really possess a meaning a..d are by n means the expres..ion f a dis integrated cerebral activity as the writers on the subject would ha e us believe *When the work of in erpret ion has been ompieted the d am can be rec gn d a a wish fulfilment*

III THE DRE M AS WISH FULFILMENT

WHE fter pa..sing through a narrow defile, one suddenly reaches height beyo d which the ways part and a ri h prospect lies ou.spread in d..erent directions it is well to .op for a m ment and consider whether one shall turn next. We are in somewhat the sam position after w ha e mas red th.s first in rpretation of a dream. We fi d ourselves ta..din.. in the light of a sudden dis overy The dream is not comparable to th irregular sound.. of a musi cal in..trument which, nstead f bei.. pla ed by the hand f musici..n is struck by ome external f rce the dream is n t meaningless not bsurd, does not presuppose that on part of our ore of ideas is d rmant whil an ..her part begins to wake It is perf ctly valid psychi p..en menon, actually a wi..h-fulfil ment t ma be enr lled in the continuity f th intelligibl psychic ctivi ies f the waking ..ate it is built ..p by highly complicated in t.ectual cti ty But at the very moment when we are about t rejoice thi d..c ery a host of pr blems besets us. If the dream as this theory defines it, represents ful..lled wish, what is the cause of the striking and un familiar manner in which this fu..filment s expressed? What tran..form on has occurred in our dream-thoughts bef re the manifest dream as w remembe t on waking ..hapes itself out of them? How has this transforma tion taken place Whence comes the mater..l that is worked up into the dream? What causes many of the peculiarities which are to be ob served in our dream-thoughts for example how is t that they are able to contrad ct one another Is the dream capable of teachin us

hic

ms

est

that for the present all these prob ems be ..a d asid and that a ngle path be pursued We have found that the dream represents a wi..h as fulfilled. Our next purpose should be to as certain whether this is a general characteri t c of dreams o whether t i only the accidental co..tent f the particular dream (the dream about Irma s injecti) with which we ha e begun our analys s for even if we conclud that every dream has a meanin.. and psychic val e, we must ne ertheless allow for the po ..bi ity that this meanin.. m y not be the same in every dream. The first dream which we ha e consid red was the fulfilment of a wi..h an ther ma t ra n t be the realization of an apprehen.. on a third may ha e a reflection as ..s co tent a fourth may ..imply reproduce a remini..cence Are there then dreams other than wish-d eams o.. are there none but wi..h dreams

It is easy t how that the wi..h fulfilmen in dreams is often und..guised a..d easy to recog nize so that o e may wo der why the language of dreams ha t lo..g sin e been understood There is for example a dream which I can evoke as ofte as I please experimentall as it were If in the eni.... I e t anchovies ol es, o oth r tro l salted food.. I am thirsty at n ght and theref re I wake The waking howeve .. preceded by a dream which h..s always the same co t t namely that I am drinking I ..m drinking l n.. draught of wat t tas es as delici us as only a cool drink can tast when on s throat is parched and then I wake and find that I ha an ctual desire t drink. The cause of thi dream is thirst which I perce e whe I wake. From this sensati n arises the wi..h t drink, and the dream hows me thi wi..h as fulfilled. It thereby serves a function the nature of wh ch I soon surmise I leep well, and m not accus tomed t bein.. waked by bo..ily eed. If I s cceed in appeasing my thirst b means f the dream that I am drinking I need t wake up in rde t satisfy that thirst. It is thus a

evening (Otto's news and the writing of the clinical history) For the result of the dream is that it is not I who am to blame for the pain which Irma is still suffering but that Otto is to blame for it Now Otto has annoyed me by his remark about Irma's imperfect cure the dream avenges me upon him in that it turns the reproach upon himself The dream acquits me of responsibility for Irma's condition as it refers this condition to other causes (which do indeed furnish quite a number of explanations) The dream represents a certain state of affairs such as I might wish to exist *the content of the dream is thus the fulfilment of a wish its motive is a wish*

This much is apparent at first sight But many other details of the dream become intelligible when regarded from the standpoint of wish fulfilment I take my revenge on Otto not merely for too readily taking sides against me in that I accuse him of careless medical treatment (the injection) but I revenge myself also for the bad liqueur which smells of fusel oil and I find an expression in the dream which unites both these reproaches the injection of a preparation of propyl Still I am not satisfied but continue to avenge myself by comparing him with his more reliable colleague Thereby I seem to say I like him better than you But Otto is not the only person who must be made to feel the weight of my anger I take my revenge on the disobedient patient by exchanging her for a more sensible and more docile one Nor do I pass over Dr M's contradiction for I express in an obvious allusion my opinion of him namely that his attitude in this case is that of an ignoramus (*Dysentery will develop etc*) Indeed it seems as though I were appealing from him to someone better informed (my friend who told me about trimethylamin) just as I have turned from Irma to her friend and from Otto to Leopold It is as though I were to say Rid me of these three persons replace them by three others of my own choice and I shall be rid of the reproaches which I am not willing to admit that I deserve! In my dream the unreasonableness of these reproaches is demonstrated for me in the most elaborate manner Irma's pains are not attributable to me since she herself is to blame for them in that she refuses to accept my solution They do not concern me for being as they are of an organic nature they cannot possibly be cured by psychic treatment Irma's sufferings are satisfactorily explained by her widowhood (trimethylamin!) a state which I cannot alter Irma's illness has been caused by an incautious injection administered by Otto an injection of an unsuitable drug such as I should never have administered Irma's complaint is the result of an injection made with an unclean syringe like the phlebitis of my old lady patient whereas my injections have never caused any ill effects I am aware that these explanations of Irma's illness which unite in acquitting me do not agree with one another that they even exclude one another The whole plea —for this dream is nothing else—recalls vividly the defence offered by a man who was accused by his neighbour of having returned a kettle in a damaged condition In the first place he had returned the kettle undamaged in the second place it already had holes in it when he borrowed it and in the third place he had never borrowed it at all A complicated defence but so much the better if only one of these three lines of defence is recognized as valid the man must be acquitted

Still other themes play a part in the dream and their relation to my non responsibility for Irma's illness is not so apparent my daughter's illness and that of a patient with the same name the harmfulness of cocaine the affection of my patient who was traveling in Egypt concern about the health of my wife my brother and Dr M my own physical troubles, and anxiety concerning my absent friend who is suffering from suppurative rhinitis But if I keep all these things in view they combine into a single train of thought which might be labelled Concern for the health of myself and others professional conscientiousness I recall a vaguely disagreeable feeling when Otto gave me the news of Irma's condition Lastly I am inclined after the event to find an expression of this fleeting sensation in the train of thoughts which forms part of the dream It is as though Otto had said to me You do not take your medical duties seriously enough you are not conscientious you do not perform what you promise Thereupon this train of thought placed itself at my service in order that I might give proof of my extreme conscientiousness of my intimate concern about the health of my relatives friends and patients Curiously enough there are also some painful memories in this material which confirm the blame attached to Otto rather than my own exculpation The material is apparently impartial but the connection between this broader material on which the dream is based and the more limited theme from which emerges the wish to

stopped. I can well imagine that she would have liked to enjoy her freedom a little longer before the discomforts of maternity began. It ... f giving notice of her first ...fe ...k ...is ...rst ...are one the young mother hope ... more enjoyment for the second child than she had for the first.

A young woman who for weeks had been cut off from all society because she was nursing a child who was suffering from an infectious disease dreamt, after the child had recovered, of a company of people in which Alphonse Daudet, Paul Bourget, Marcel Prevost and others were present; they were all very pleasant to her and amused her enormously. In her dream these different authors had the features which their portraits give them. M. Prevost, with whose portrait she is not familiar, looked like the man who had disinfected the sickroom the day before, the first outsider to enter it for a long time. Obviously the dream is to be translated thus: "It is about time now for something more entertaining than this eternal nursing."

Perhaps this collection will suffice to prove that frequently and under the most complex conditions dreams may be noted which can be understood only as wish fulfilments, and which present their content without concealment. In most cases these are short and simple dreams, and they stand in pleasant contrast to the confused and overloaded dream-compositions which have almost exclusively attracted the attention of the writers on the subject. But it will repay us if we give some time to the examination of these simple dreams. The simplest dreams of all are, I suppose, to be expected in the case of children whose psychic activities are certainly less complicated than those of adults. Child psychology, in my opinion, is destined to render the same services to the psychology of adults as a study of the structure or development of the lower animals renders to the investigation of the structure of the higher orders of animals. Hitherto but few deliberate efforts have been made to make use of the psychology of the child for such purpose.

The dreams of little children are often simple fulfilments of wishes, and for this reason are, as compared with the dreams of adults, by no means interesting. They present no problem to be solved, but they are invaluable as affording proof that the dream, in its inmost essence, is the fulfilment of a wish. I have been able to collect several examples of such dreams from the material furnished by my own children.

For two dreams, one that of a daughter of mine, at that time eight and a half years of age, and the other that of a boy of five and a quarter, I am indebted to an excursion to Hallstatt in the summer of 1896. I must first explain that we were living that summer on a hill near Aussee, from which, when the weather was fine, we enjoyed a splendid view of the Dachstein. With a telescope we could easily distinguish the Simony hut. The children often tried to see it through the telescope—I do not know with what success. Before the excursion I had told the children that Hallstatt lay at the foot of the Dachstein. They looked forward to the outing with the greatest delight. From Hallstatt we entered the valley of Eschern, which enchanted the children with its constantly changing scenery. One of them, however, the boy of five, gradually became discontented. As often as a mountain came into view he would ask: "Is that the Dachstein?" whereupon I had to reply: "No, only a foot-hill." After this question had been repeated several times he fell quite silent, and did not wish to accompany us up the steps leading to the waterfall. I thought he was tired. But the next morning he came to me perfectly happy, and said: "Last night I dreamt that we went to the Simony hut." I understood him now; he had expected, when I spoke of the Dachstein, that on our excursion to Hallstatt he would climb the mountain, and would see at close quarters the hut which had been so often mentioned when the telescope was used. When he learned that he was expected to content himself with foot-hills and a waterfall he was disappointed and became discontented. But the dream compensated him for all this. I tried to learn some details of the dream; they were scanty. "You ... a h... h...d been told."

...

quite a polished little gentleman, who, it seemed to me, had already won the little woman's sympathies. Next morning she related the following dream: "Just think, I dreamt that Emil was one of the family, that he said 'papa' and 'mamma' to you, and slept ... our house in the living room, like one of the boys. Then mamma

dream of convenience The dream takes the place of action as elsewhere in life Unfortu nately the need of water to quench the thirst cannot be satisfied by a dream as can my thirst for revenge upon Otto and Dr M but the intention is the same Not long ago I had the same dream in a somewhat modified form On this occasion I felt thirsty before going to bed and emptied the glass of water which stood on the little chest beside my bed Some hours later during the night my thirst re turned with the consequent discomfort In or der to obtain water I should have had to get up and fetch the glass which stood on my wife s bed table I thus quite appropriately dreamt that my wife was giving me a drink from a vase this vase was an Etruscan ciner ary urn which I had brought home from Italy and had since given away But the water in it tasted so salt (apparently on account of the ashes) that I was forced to wake It may be observed how conveniently the dream is capa ble of arranging matters Since the fulfilment of a wish is its only purpose it may be per fectly egoistic Love of comfort is really not compatible with consideration for others The introduction of the cinerary urn is probably once again the fulfilment of a wish I regret that I no lon er possess this vase it like the glass of water at my wife s side is inaccessible to me The cinerary urn is appropriate also in connection with the sensation of an increas ingly salty taste which I know will compel me to wake

Such convenience dreams came very fre quently to me in my youth Accustomed as I had always been to working until late at night early waking was always a matter of difficulty I used then to dream that I was out of bed and standing at the wash tand After a while I could no longer shut out the knowledge that I was not yet up but in the meantime I had continued to leep The same sort of lethargy dream was dreamed by a young colleague of mine who appears to share my propensity for sleep With him it assumed a particularly amus ing form The landlady with whom he was lodging in the neighbourhood of the hospital had strict orders to wake him every mornin at a given hour but she found it by no means easy to carry out his orders One mornin sleep was especially sweet to him The woman called into his room Herr Pepi get up you ve got to go to the hospital Whereupon the sleeper dreamt of a room in the ho pital of a bed in which he was lying and of a chart pinned over his head which read as follows Pepi M medical student 22 years of age He told himself in the dream If I am already at the hospital I don t have to go there turned over and slept on He had thus frankly ad mitted to himself his motive for dreaming

Here is yet another dream of which the stim ulus was active during sleep One of my women patients who had been obliged to undergo an unsuccessful operation on the jaw was in structed by her physicians to wear by day and night a cooling apparatus on the affected cheek but she was in the habit of throwing it off as soon as she had fallen asleep One day I was asked to reprove her for doing so she had again thrown the apparatus on the floor The patient defended herself as follows This time I really couldn t help it it was the result of a dream which I had during the night In the dream I was in a box at the opera and was taking a lively interest in the performance But Herr Karl Meyer was lyin in the sanatorium and complaining pitifully on account of pains in his jaw I said to myself Since I haven t the pains I don t need the apparatus either that s why I threw it away The dream of this poor sufferer reminds me of an expression which comes to our lips when we are in a disagreeable situation Well I can imagine more amusing things! The dream presents these more amus ing things! Herr Karl Meyer to whom the dreamer attributed her pains was the most casual acquaintance of whom she could think

could *not* of cour e be *explained without* questioning the child

From a friend I have learned of a dream very much like that of my *little* boy *It* was dreamed by a little girl of eight Her father accompanied by several children had started on a walk to Dornbach with the intention of visiting the Rohrer hut but had turned back as it was growing late promising the children to take them some other time On the way back they passed a signpost which pointed to the Hameau The children now asked him to take them to the Hameau but once more and *for the* same reason they had to be content with the promise that they should go there some other day Next morning the little girl went to her *father* and told him with a satisfied air

Papa I dreamed last night that you were with us at the Rohrer hut and on the Hameau *Thus in the dream her* impatience had anticipated the fulfilment of the promise made by her father

Another dream with which the picturesque beauty of the Aus *ee inspired my daughter* at that time three and a quarter years of age is equally straightforward The little girl had crossed *the lake for the first time* and *the trip* had passed too quickly for her She did not want to leave the boat at the landing and cried bitterly The next mornin she told us *Last night* I was *sailing on the lake* Let us hope that the duration of this dream voyage was more satisfactory to her

My eldest boy at that time eight years *of* age was already dreaming of the realization of his fancies He had ridden in a chariot with Achilles with Diomedes as charioteer On the

children in their sleep belongs to the phere o dreams I can relate the following as one of the earliest dreams in my collection My youn est daughter at that time nineteen months old vomited one morning and was therefore kept without food all day During the night she was *heard to call excitedly in her sleep* Anna F(r)eud *St awbewy wild st au bewy om lette pap!* She used her name in this way in order to express the act of appropriation *the menu* presumably included everything that would seem to her a desirable meal the fact that two varieties of strawberry appeared in it w s *a demonstration against the sanitary* regulations of the household and was based on the circumstance which she had by no means overlooked that the nurse had ascribed *her indis*position to an over plentiful consumption of strawberries so in her dream she avenged her elf for this opinion which met with her *disapproval*

When we call childhood happy because it does not yet know sexual desire we mu t not forget what a *fruitful source of disappointment* and renunciation and therefore of dream stimulation the other great vital impulse may be

consulted, several pos bl olutions might sug gest themsel es for example that d ring sleep n is incapable of finding an dequate ex pressi for one s dre m thoughts The anal ysis of certain dreams however compels us to off r anoth r explanat o I shall d mon trate this by means of second dream of my own, which again invol es num rous indiscret ons but which compe sates f r this personal sacri fic by affording a thorough lucidation of the problem.

P l m nary Statement

In the spring of 189 I learnt that two professors of ur uni ersity had p oposed me for the t tle of *P of ssor Ext aord narius* (as stant pr fesso) The n ws came as a surprise to me and pleased m co d rably as an express on f appre iati o the part f two eminent men which c uld not be explained by perso al int rest B t I t ld m self mmediately that I mu t not xpect anything to ome of their proposal. F me ears pa t the Ministry had di regarded such p oposals a d several col leagues f mine who were my senio s and at least my equals n desert had been wa ting in ain all this time for th appointment I had no reaso to suppose that I sho ld fare any bett r I resol ed theref re to resign myself to disappointm t I am t so far as I know amb tious and I was f llowing my profession with gratif ing s es eve with t th rec ommend ti of a profess nal title. Whether I c n de ed the grapes to be sweet o sour did not matter inc they undoubtedly hung too high f r m

One evening a friend of mine called to see m e f th se olleagues whose fate I had regarded as warning As h had l n been a candidate for prom ti t the professorate (whi h in our societ makes the doctor a dem god to his patients) and h was les resigned than I h w accustomed f m tim t time t remind the auth rities of his laims in the hope f ad ancing hi interests. It was after one f these isits that h called m He said that th time h had driven th xalted gentleman into corner and had a ked him frankly wheth r cons derations f religious d nomination were t really responsible for th po tpo em t of his ppointm t. The answer was His Ex llency had to dmit that in the present st t of publi opinio he was n t in a pos t on etc Now at least I know where I stand, my friend concluded his narrative which told me nothi g new but which was calculated t confirm me in my res gnation For the same denominational considerations would apply to my own case

On the morning after my friend s visit I had the following dream which was notable also on account of its f rm. It cons sted of two thoughts and two images o that a thought and an image emerged alternately But here I shall record only the first half of th dream since th second half has no relation to the purpose for which I cite th dream

I *My friend R is my uncle—I have a great affect on for h m*

II *I s e before me his face somewhat altered It seems to be elongated a yellow beard wh ch surr u ds it is seen with pecul ar dist ct ess*

Th n follow the othe two portions of the dream again a thought and an image which I omit.

The interpretati n of this dream was arri ed at in the follow ng manner

Wh I recollected the dream in the course of the morning I la hed outright and sa d 'The dream is non ense But I co ld not get it ut of my mind and I was pursued by it all day until at last n the eve n I reproached myself in these words If in the course of a dream interp etat on on of yo r pat ents could find nothing better to ay than 'That is nonsense yo w ld reprove him and you would su pect that behind the dream th re was hidden ome disagreeable ffair the expo u e of which h wanted to pare himself Apply th same thin to your own case your op nion that the dream is nonsense p obably signifies merely an nne re i tance to its interpretat n Do t let yours lf be put off I th n proceeded with the interpretation

R is my uncle What can that mean? I had only e uncl my uncle Joseph. His tory to be sure was a sad one Once m re than thirty years a o hoping t make money he allowed himself t be in l ed in transactions of a kind which th law punishes sev rely and pa d th penalty My f the whose hair t rned grey with gri f within a few days used always to say that uncle Joseph had ever been bad man b t fter all he wa a mpleton If then my friend R is my uncle Joseph, that is

I Is onish g t see how my mem ry here re ricts tself—in the wak g tate —f the purposes f anal is I ha e k own fi e I my les nd I l ved and ho red ne f them. B the momen when I vercame my res tance to the interpreta on f the dre m I said to m self I have ly one ncle the one who is in ended in the dream.

be any dreams other than wish dreams I know beforehand that I shall meet with the mo t emphatic contradiction My critics will object The fact that there are dreams which are to be understood as fulfilments of wishes is not new but has long since been recognized by such writers as Radestock Volkelt Purkinje Griesinger and others That there *can* be no other dreams than those of wish fulfilments is yet one more unjustified generalization which fortunately can be easily refuted Dreams which present the most painful content and *not the least trace of wish fulfilment* occur frequently enough The pessimistic philosopher Eduard von Hartmann is perhaps most completely opposed to the theory of wish fulfilment In his *Philosophy of the Unconscious* Part II (*Stereotyped German edition* p 344) he says As regards the dream with it all the troubles of waking life pass over into the sleeping state all save the one thing which may in some degree reconcile the cultured per on with *life—scientific and artistic enjoyment*

But even less pessimistic observers have emphasized the fact that in our dreams pain and disgust are more frequent than pleasure (Scholz p 33 *Volkelt* p 80 *et al*) Two ladies Sarah Weed and Florence Hallam have even worked out on the basis of their dreams a numerical value for the preponderance of distress and discomfort in dreams They find *that 58 per cent of dreams are disagreeable* and only 28 6 positively pleasant Besides those dreams that convey into our sleep the many painful emotions of life there are also anxiety dreams in which this most terrible of all the painful emotions torments us until we wake Now it is precisely by these anxiety dreams that children are so often haunted (cf Debacker on *Pavor nocturnus*) and yet it was *in children that you found the wish fulfilment* dream in its most obvious form

The anxiety dream does really seem to preclude a generalization of the thesis deduced from the examples *given in the last chapter* that dreams are wish fulfilments and even to

parry these

It is merely

neces ary to observe tu u trine is not based upon the estimates of the obvious dream content but relates to the thought content which in the course of interpretation *is found* to lie behind the dream Let us compare and contrast the *manifest* and the *latent dream content* It is true that there are dreams the manifest content of which is of the most painful nature But has anyone ever tried to interpret these dreams—to discover their latent thought content? If not the two objections to *our doctrine* are no longer valid for there is always the possibility that even our painful and terrifying dreams may upon interpretation prove to be wish fulfilments

In scientific research it is often advantageous if the solution of one problem presents difficulties to add to it a second problem just as it is easier to crack two nuts together instead of separately Thus we are confronted not only with the problem How can painful and *terrifying dreams be the fulfilments of wishes*? but we may add to this a second problem which arises from the foregoing discussion of the general problem of the dream Why do not the dreams that show an indifferent content *and yet turn out to be wish fulfilments* reveal their meaning without disguise? Take the exhaustively treated dream of Irma s injection it is by no means of a painful character and *it may be recognized upon interpretation* as a striking wish fulfilment But why is an interpretation necessary at all? Why does not the dream say directly what it means? As a matter of fact the dream of Irma s injection *does not at first produce the impression* that it represents a wish of the dreamer s as fulfilled The reader will not have received this impression and even I myself was not aware of the *fact until I had undertaken the analysis* If we call this peculiarity of dreams—namely that they need elucidation — the phenomenon of distortion in dreams a second question then arises What i the origin of this *distortion* in dreams?

If one s first thoughts on this subject were

express my affection for him in terms approaching the degree of affection which I felt in the dream, he would undoubtedly be surprised. My affection, if it was for him, seems false and exaggerated, as does my judgment of his intellectual qualities which I expressed by merging his personality in that of my uncle, but exaggerated in the opposite direction. Now, however, a new state of affairs dawns upon me. The affection in the dream does not belong to the latent content, to the thoughts behind the dream; it stands in opposition to this content; it is calculated to conceal the knowledge conveyed by the interpretation. Probably this is precisely its function. I remember with what reluctance I undertook the interpretation, how long I tried to postpone it, and how I declared the dream to be sheer nonsense. I know from my psycho-analytic practice how such condemnation is to be interpreted. It has no informative value, but merely expresses an affect. If my little daughter does not like an apple which is offered her, she asserts that the apple is bitter without even tasting it. If my patients behave thus, I know that we are dealing with an idea which they are trying to repress. The same thing applies to my dream. I do not want to interpret it because there is something in the interpretation to which I object. After the interpretation of the dream is completed, I discover what it was to which I objected; it was the assertion that R is a simpleton. I can refer the affection which I feel for R not to the latent dream-thoughts, but rather to this unwillingness of mine. If my dream, as compared with its latent content, is disguised at this point, and actually misrepresents things by producing their opposites, then the manifest affection in the dream serves the purpose of the misrepresentation; in other words, the distortion is here shown to be intentional—it is a means of *disguise*. My dream-thoughts of R are derogatory, and so that I may not become aware of this the very opposite of derogation—a tender affection for him—enters into the dream.

This discovery may prove to be generally valid. As the examples in Chapter III have demonstrated, there are, of course, dreams which are undisguised wish-fulfilments. Wherever a wish-fulfilment is unrecognizable and disguised there must be present a tendency to defend oneself against this wish, and in consequence of this defence the wish is unable to express itself save in a distorted form. I will try to find a parallel in social life to this occurrence in the inner psychic life. Where in social life can a similar misrepresentation be found? Only where two persons are concerned, one of whom possesses a certain power while the other has to act with a certain consideration on account of this power. The second person will then distort his psychic actions, or, as we say, he will mask himself. The politeness which I practise every day is largely a disguise of this kind; if I interpret my dreams for the benefit of my readers I am forced to make misrepresentations of this kind. The poet even complains of the necessity of such misrepresentation: *Das Beste was du wissen kannst, darfst du den Buben doch nicht sagen.* "The best that thou canst know thou mayst not tell to boys."

The political writer who has unpleasant truths to tell to those in power finds himself in a like position. If he tells everything without reserve, the Government will suppress them—retrospectively in the case of a verbal expression of opinion, preventively if they are to be published in the Press. The writer stands in fear of the censorship; he therefore moderates and disguises the expression of his opinions. He finds himself compelled, in accordance with the sensibilities of the censor, either to refrain altogether from certain forms of attack, or to express himself in allusions instead of by direct assertions; or he must conceal his objectionable statement in an apparently innocent disguise. He may, for instance, tell of a contretemps between two Chinese mandarins, while he really has in mind the officials of his own country. The stricter the domination of the censorship, the more thorough becomes the disguise, and, often enough, the more ingenious the means employed to put the reader on the track of the actual meaning.

The detailed correspondence between the phenomena of censorship and the phenomena of dream-distortion justifies us in presupposing similar conditions for both. We should then assume that in every human being there exist, as the primary cause of dream formation, two psychic forces (tendencies or systems), one of which forms the wish expressed by the dream, while the other exercises a censorship over this dream-wish, thereby enforcing on it a distortion. The question is: What is the nature of the authority of this second agency by virtue of which it is able to exercise its censorship? If we remember that the latent dream-thoughts are not conscious before analysis, but that the manifest dream-content emerging from them is consciously remembered, it is not a far

equivalent to saying R is a simpleton Hardly credible and very disagreeable! But there is the face that I saw in the dream with its elongated features and its yellow beard My uncle actually had such a face—long and framed in a handsome yellow beard My friend R was extremely swarthy but when black haired people begin to grow grey they pay for the glory of their youth Their black beards undergo an unpleasant change of colour hair by hair first they turn a reddish brown then a yellowish brown and then definitely grey My friend R s beard is now in this stage so for that matter is my own a fact which I note with regret The face that I see in my dream is at once that of my friend R and that of my uncle It is like one of those composite photographs of Galton s in order to emphasize family resemblances Galton had several faces photographed on the same plate No doubt is now possible it is really my opinion that my friend R is a simpleton—like my uncle Joseph

I have still no idea for what purpose I have worked out this relationship It is certainly one to which I must unreservedly object Yet it is not very profound for my uncle was a criminal and my friend R is not except in so far as he was once fined for knocking down an apprentice with his bicycle Can I be thinking of this offence? That would make the comparison ridiculous Here I recollect another conversation which I had some days ago with another colleague N as a matter of fact on the same subject I met N in the street he too has been nominated for a professorship and having heard that I had been similarly honoured he congratulated me I refused his congratulations saying You are the last man to jest about the matter for you know from your own experience what the nomination is worth Thereupon he said though probably not in earnest You can t be sure of that There is a special objection in my case Don t you know that a woman once brou ht a criminal accusation against me? I need hardly assure you that the matter was put right It was a mean attempt at blackmail and it was all I could do to save the plaintiff from punishment But it may be that the affair is remembered against me at the Ministry You on the other hand are above reproach Here then I have the criminal and at the same time the interpretation and tendency of my dream My uncle Joseph repre ents both of my colleagues who have not been appointed to the professorship—the one as a simpleton the other as a criminal Now too I know for what purpose I need this representation If denominational considerations are a determining factor in the po tponement of my two friends appointment then my own appointment is likewise in jeopardy But if I can refer the rejection of my two friends to other causes which do not apply to my own case my hopes are unaffected This is the procedure followed by my dream it makes the one friend R a simpleton and the other N a criminal But since I am neither one nor the other there is nothing in common between us I have a right to enjoy my appointment to the title of professor and have avoided the distressing application to my own case of the information which the official gave to my friend R

I must pursue the interpretation of this dream still farther for I have a feeling that it is not yet satisfactorily elucidated I still feel disquieted by the ease with which I have degraded two respected colleagues in order to clear my own way to the professorship My dissatisfaction with this procedure has of course been mitigated since I have learned to estimate the testimony of dreams at its true value I should contradict anyone who su gested that I really considered R a simpleton or that I did not believe N s account of the blackmailing incident And of cour e I do not believe that Irma has been made seriously ill by an injection of a preparation of propyl administered by Otto Here as before what the dream expresses is only my *wish that things might be so* The statement in which my wish is realized sounds less absurd in the second dream than in the first it is here made with a skilful use of actual points of support in establishing something like a plausible lander one of which one could say that there is something in it For at that time my friend R had to contend with the adverse vote of a university professor of his own department and my friend N had himself all unsuspectingly provided me with material for the calumny Nevertheless I repeat it still seems to me that the dream requires further elucidation

I remember now that the dream contained yet another portion which has hitherto been ignored by the interpretation After it occurred to me that my friend R was my uncle I felt in the dream a great affection for him To whom is this feeling directed? For my uncle Jo eph, of course I have never had any feelings of affection R has for many years been a dearly loved friend but if I were to go to him and

are several examples of the sort of dream-material which is offered in refutation of my theory.

"You are always saying that a dream is a wish fulfilled," begins an intelligent lady patient. "Now I shall tell you a dream in which the content is quite the opposite, in which a wish of mine is not fulfilled. How do you reconcile that with your theory? The dream was as follows: *I want to give a supper, but I have nothing available except some smoked salmon. I think I will go shopping, but I remember that it is Sunday afternoon, when all the shops are closed. I then try to ring up a few caterers, but the telephone is out of order. Accordingly I have to renounce my desire to give a supper.*"

I reply, of course, that only the analysis can decide the meaning of this dream, although I admit that at first sight it seems sensible and coherent, and looks like the opposite of a wish-fulfilment. "But what occurrence gave rise to this dream?" I ask. "You know that the stimulus of a dream always lies among the experiences of the preceding day."

Analysis

The patient's husband, an honest and capable wholesale butcher, had told her the day before that he was growing too fat, and that he meant to undergo treatment for obesity. He would rise early, take physical exercise, keep to a strict diet, and above all accept no more invitations to supper. She proceeds jestingly to relate how her husband, at a *table d'hôte*, had made the acquaintance of an artist, who insisted upon painting his portrait, because he, the painter, had never seen such an expressive head. But her husband had answered in his downright fashion, that while he was much obliged, he would rather not be painted, and he was quite convinced that a bit of a pretty girl's posterior would please the artist better than his whole face.[1] She is very much in love with her husband, and teases him a good deal. She has asked him not to give her any caviar. What can that mean?

As a matter of fact, she had wanted for a long time to eat a caviar sandwich every morning, but had grudged the expense. Of course she would get the caviar from her husband at once if she asked for it. But she has, on the contrary, begged him not to give her any caviar, so that she might tease him about it a little longer.

(To me this explanation seems thin. Unconfessed motives are wont to conceal themselves behind just such unsatisfying explanations. We are reminded of the subjects hypnotized by Bernheim, who carried out a post-hypnotic order, and who, on being questioned as to their motives, instead of answering: "I do not know why I did that," had to invent a reason that was obviously inadequate. There is probably something similar to this in the case of my patient's caviar. I see that in waking life she is compelled to invent an unfulfilled wish. Her dream also shows the non-fulfilment of her wish. But why does she need an unfulfilled wish?)

The ideas elicited so far are insufficient for the interpretation of the dream. I press for more. After a short pause, which corresponds to the overcoming of a resistance, she reports that the day before she had paid a visit to a friend of whom she is really jealous because her husband is always praising this lady so highly. Fortunately, this friend is very thin and lanky, and her husband likes full figures. Now of what did this thin friend speak? Of course *of her wish to become rather plumper.* She also asked my patient: "When are you going to invite us again? You always have such good food."

Now the meaning of the dream is clear. I am able to tell the patient: "It is just as though you had thought at the moment of her asking you: 'Of course, I'm to invite you so that you can eat at my house and get fat and become still more pleasing to my husband! I would rather give no more suppers!' The dream then tells you that you cannot give a supper, thereby fulfilling your wish not to contribute anything to the rounding out of your friend's figure. Your husband's resolution to accept no more invitations to supper in order that he may grow thin teaches you that one grows fat on food eaten in other people's houses." Nothing is lacking now but some sort of coincidence which will confirm the solution. The smoked salmon in the dream has not yet been traced.—"How did you come to think of salmon in your dream?" "Smoked salmon is my friend's favourite dish," she replied. *It happens that I know the lady, and am able to affirm that she grudges herself salmon just as my patient grudges herself caviar.*

This dream admits of yet another and more exact interpretation—one which is actually necessitated only by a subsidiary circumstance.

[1] To sit for the painter.
Goethe: "And if he has no backside,
How can the nobleman sit?"

fetched assumption that admittance to the consciousness is the prerogative of the second agency Nothing can reach the consciousness from the first system which has not previously passed the second instance and the second instance lets nothing pass without exercising its rights and forcing such modifications as are pleasing to itself upon the candidates for admission to consciousness Here we arrive at a very definite conception of the *essence* of consciousness for us the state of becoming conscious is a special psychic act different from and independent of the process of becoming fixed or represented and consciousness appears to us as a sensory organ which perceives a content proceedin from another source It may be shown that psycho pathology simply cannot dispense with these fundamental assumptions But we shall reserve for another time a more exhaustive examination of the subject

If I bear in mind the notion of the two psychic instances and their relation to the consciousness I find in the sphere of politics a perfectly appropriate analogy to the extraordinary affection which I feel for my friend R who is so disparaged in the dream interpretation I refer to the political life of a State in which the ruler jealous of his rights and an active public opinion are in mutual conflict The people protesting against the actions of an unpopular official demand his dismissal The autocrat on the other hand in order to show his contempt for the popular will may then deliberately confer upon the official some exceptional distinction which otherwise would not have been conferred Similarly my second instance controlling the access to my consciousness distinguishes my friend R with a rush of extraordinary affection because the wish tendencies of the first system in view of a particular interest on which they are just then intent would like to disparage him as a simpleton

We may now perhaps begin to suspect that dream interpretation is capable of yielding information concerning the structure of our psychic apparatus which we have hitherto vainly expected from philosophy We shall not however follow up this trail but shall return to our original problem as soon as we have elucidated the problem of dream distortion The question arose how dreams with a disagreeable content can be analysed as wish fulfillments We see now that this is possible where a dream distortion has occurred when the disagreeable content serves only to disguise the thing wished for With regard to our assumptions respecting the two psychic instances we can now also say that disagreeable dreams contain as a matter of fact something which is disagreeable to the second instance but which at the same time fulfills a wish of the first instance They are wish dreams in so far as every dream emanates from the first instance while the second instance behaves towards the dream only in a defensive not in a constructive manner Were we to limit ourselves to a consideration of what the second instance contributes to the dream we should never understand the dream and all the problems which the writers on the subject have discovered in the dream would have to remain unsolved

That the dream actually has a secret meaning which proves to be a wish fulfillment must be proved afresh in every case by analysis I will therefore select a few dreams which have painful contents and endeavour to analyse them Some of them are dreams of hysterical subjects which therefore call for a long preliminary statement and in some passages an examination of the psychic processes occurring in hysteria This though it will complicate the presentation is unavoidable

When I treat a psychoneurotic patient analytically his dreams regularly as I have said become a theme of our conversations I must therefore give him all the psychological explanations with whose aid I myself have succeeded in understanding his symptoms And here I encounter unsparing criticism which is perhaps no less shrewd than that which I have to expect from my colleagues With perfect uniformity my patients contradict the doctrine that dreams are the fulfillments of wishes Here

I w uld rather gi e no more suppers' The dream then tells yo that you cannot gi e supper *thereby fulfillin* your wi h not to contribute anything t th roundin out of your friend s figur Y ur husband s *resoluti n to accept no* more in tat ns to supper in o der that he may gr w thi teaches y u that o gr ws fat on food eaten at other pe pl tables. Nothi g is la ki g n w but s me s rt of c inc d e which will nfirm the olutio The smoked alm in the dream has not et been traced— "How d d you come t think of salmo in your dream? — Smoked almon is my frie d s fa ourit dish, sh replied It happens that I know the lady and am ble to affirm that she grudges herself salm n ju t as my patie t grudges herself ca ia

This dream adm ts of yet an th r and more exact terpretat on—one whi h is actually ne cess ta ed nly by a sub diary circum tance,

T for the pai er
Goethe *A k h b t*
Her k m t

The two interpretations do not contradict one another but rather dovetail into one another and furnish an excellent example of the usual ambiguity of dreams as of all other psycho pathological formations We have heard that at the time of her dream of a denied wish the patient was impelled to deny herself a real wish (the wish to eat caviar sandwiches) Her friend too had expressed a wish namely to get fatter and it would not surprise us if our patient had dreamt that this wish of her friend s—the wish to increase in weight—was not to be fulfilled Instead of this however she dreamt that one of her own wishes was not fulfilled The dream becomes capable of a new interpretation if in the dream she does not mean herself but her fri nd if she has put herself in the place of her friend or as we may say has *identified* herself with her friend

I think she has actually done this and as a sign of this identification she has created for herself in real life an unfulfilled wish But what is the meanin of this hysterical indenti fication? To elucidate this a more exhaustive exposition is necessary Identification is a high ly important motive in the mechanism of hys terical symptoms by this means patients are enabled to express in their symptoms not mere ly their own experiences but the experiences of quite a number of other persons they can suffer as it were for a whole mass of people and fill all the parts of a drama with their own personalities It will here be objected that this is the well known hysterical imitation the ability of hysterical subjects to imitate all the symptoms which impress them when they oc cur in others as thou h pity were aroused to the point of reproduction This however only indicates the path which the psychic process follows in hysterical imitation But the path it self and the psychic act which follows this path are two different matters The act itself is slightly more complicated than we are prone to believe the imitation of the hysterical to be it corresponds to an unconscious end proc ess as an example will show The physician who has in the same ward with other patients a female patient suffering from a particular kind of twitching is not surprised if one morn ing he learns that this peculiar hysterical affec tion has found imitators He merely tells him self The others have seen her and have imi tated her this is psychic infection Yes but psychic infection occurs somewhat in the fol lowing manner As a rule patients know more about one another than the physician knows about any one of them and they are concerned about one another when the doctor s vi it is over One of them has an attack to-day a once it is known to the rest that a letter from home a recrudescence of lovesickness or the like is the cause Their sympathy is arou ed and although it does not emerge into conscious ness they form the following conclusion If it is possible to suffer such an attack from such a cau e I too may suffer this sort of an attack for I have the same occasion for it If this were a conclusion capable of becoming con scious it would perhaps express itself in *dread* of sufferin a like attack but it is formed in another psychic region and consequently ends in the realization of the dreaded symp toms Thus identification is not mere imita tion but an assimilation based upon the ame aetiological claim it expresses a *just like* and refers to some common condition which has remained in the unconscious

In hysteria identification is most frequently employed to express a sexual community The hysterical woman identifies herself by her symptoms most readily—though not exclusive ly—with persons with whom she has had sexual relations or who have had sexual intercourse with the same persons as herself Language takes cognizance of this tendency two lovers are said to be one In hysterical phantasy as well as in dreams identification may ensue if one simply thinks of sexual relations they need not necessarily become actual The patient is merely following the rules of the hysterical proc esses of thought when she expresses her jealousy of her friend (which for that matter she her self admits to be unjustified) by putting herself in her friend s place in her dream and identify ing herself with her by fabricating a symptom (the denied wish) One might further elucidate the process by saying In the dream she puts herself in the place of her friend because her friend has taken her own place in relation to her husband and because she would like to take her friend s place in her husband s esteem.

The contradiction of my theory of dreams on the part of another female patient the most intelligent of all my dreamers was solved in a simpler fashion though still in accordance with the principle that the non fulfilment of one

wi.h signified the fulfilment of another I had one d y explained to her that a dream is a wish fulfilment. On the following day she related a dream t the effect that he was tra elling with her m ther in law to the place in which they were both to spend the summer Now I knew that .h had v olently protested against pend in the summer in the neighbourhood of her moth r in law I also knew that she had fortu nat ly been bl to avo d d ing o since .he had re ently succeeded in renting a house a pl.ce quite remote from that to which her mother in law was g ing And now the dream reversed th des red solut on Was not this a flat contrad ction of my theory of wi.h fulfil ment? On had only to draw the inferences from this dream in rder to arrive at ts interpre tat on. Ac rding t this dream I was wrong *b t it was her wish that I shou d be wrong a d this wish the d e m showed her as fulfilled* But the wi.h that I hould be wro which was fulfilled in the theme of the country house referred in reality to another and mo e serious matt At that tim I had inferred, from the material furn hed by her analysis that ome thi g of significance in respect to h r illness must ha e o curred at a certain time in her life. She had denied this becau e t was not present in he memory W soon came to see that I was right. Thus he wish that I sh uld p ove to be wrong which was tran.formed into the dre.m th.t she was going into the ountry with h m h in law c rresponded with the ju.t fiab wi.h that those th gs which were then only suspe ted had never occurred.

W th ut an analysis and merely by means of an a.sumpt on I took the l berty of inter preting littl inc dent in th life of frie d, who had be my ompanion thro gh e ght classes t chool. He onc heard a lect re of min d li red t a mall udienc on the ovel idea that dreams are wish fulfilments He went hom dreamt *that he had lo t all his lawsuit* —he was a lawy r—and th n om plained t me bout it. I took ref in the evasion 'One can t win all o cases but I tho ht to myself "If for e ght ye rs I sat as *primus* on th first bench, while he mo ed up and down somewhere in the middl of the lass may he ot naturally ha e had th wish, ever sinc his boyhood, that I too might f r o mak fool f myself?

A t an ther dream f more gloomy char cter was f red m by female pat ent in contradiction f my theory f th wi h-dream This patient, a young girl, began as follow

You remember that my sister has now only one boy Ch les. She lost the elder one Otto while I was till living with her Otto was my fa ourite it was I who really brought him up I like the other little fellow too but of course not nea ly as much as his dead brother Now I dreamt last night that I *saw Charles lyi g dead before me He was ly ng n his l ttle coffin his hands folded there were candles all about and short it was just as t was at the t me of l ttle Otto s death wh ch gave me such a shock* Now tell me what does this mean? You know me—am I really o bad as to wi h that my ister h uld lose the only child he has left? Or does the dream mean that I wish that Charles had died rather than Otto whom I liked o much better?

I assured her that this latter interpretation was imposs ble After some reflection, I was able to give her the interpretation of the dre.m which she sub equently confirmed I was able to do so because the whole prev ous history of the dream r was known to me

Ha n become an orphan at an early age the girl had been brought up in the home of a much elde ister and had met amon the friends and vis tors who frequented the house a man who made a la ting impres on upon her affectio s It looked for a time as though these barely explicit relati ns would end in marri ge, but th happy culmination was frustrated by the ister whose m tives were never com pl tely explained After the rupture the man whom my patient loved a o ded the house .he herself attained her independence ome time afte the death of little Otto t whom, meanwhile her affections had turned But she did not succeed i freeing h rself from the de- pendence d e to he affection for her sister s friend H r pride bade her avoid him but he found t imposs bl to transfer her love to the other suitors who succes ively presented them selves Whenever the man h loved who was ... profes a ounced

l

told me that the Professor was going to a cer tain co cert and that she too was going in order to enjoy the s ght of him. This was on the day bef re th dream and the co cert was to be given on the day which he told m the dream. I ould now eas ly se the correct int rpretatio and I a ed her wh ther she could th.nk of any particular event which had

occurred after Otto s death She replied imme diately Of course the Professor returned then after a long absence and I saw him once more be side little Otto s coffin It was just as I had ex pected I interpreted the dream as follows If *now the other boy were to die* the same thing would happen again You would spend the day with your sister the Professor would certainly come to offer his condolences and you would see him once more under the *same circum* stances as before The dream signifies nothing more than this wish of yours to see him again—a wish against which you are fighting inwardly I know that you have the ticket for today s concert in your bag Your dream is a dream of impatience it has anticipated by several hours *the meeting which is to take place to day*

In order to disguise her wish she had ob viously selected a situation in which wishes of the sort are commonly suppressed—a situation so sorrowful that love is not even thou ht of And yet it is entirely possible that even in the actual situation beside the coffin of the elder *more dearly loved boy* she had not been able to suppress her tender affection for the visitor whom she had missed for so long

treatment In the course of a longer dream it seemed to this lady that she saw her fifteen year old daughter lying dead before her in a box She was strongly inclined to use this dream image as an objection to the theory of *wish fulfilment although she herself suspected* that the detail of the box must lead to a differ ent conception of the dream For in the course of the analysis it occurred to her that on the previous evening the conversation of the people in whose company she found herself had turned on the English word *box* and upon the numer ous translations of it into German such as *Schachtel* (box) *Loge* (box at the theatre) *Kasten* (chest) *Ohrfeige* (box on the ear) etc *From other components of the same dream it* was now possible to add the fact that the lady had guessed at the relationship between the English word *box* and the *German Buchse* and had then been haunted by the recollection that *Buchse* is used in vulgar parlance to de note the female genitals It was *therefore* pos sible treatin her knowledge of topographical anatomy with a certain indul ence to as ume that the child *in the box signified a child* in the mother s womb At this stage of the explan ation she no longer denied that the picture in the dream actually corresponded with a wish of hers Like so many other young women she was by no means happy on finding that she was pregnant and she had confessed to me more *than once the wish that her child might die* before its birth in a fit of anger following a violent scene with her husband she had even struck her abdomen with her fists in order to injure the *child* within The dead child was therefore really the fulfilment of a wish but a wish which had been put aside for fifteen years and it is not surprising that the fulfil ment of the wish was no longer recognized after so long an interval For there had been many changes in the meantime

The *group of dreams* (having as content the death of beloved relatives) to which belong the last two mentioned will be considered again under the head of Typical Dreams I shall then be able to show by new examples that in spite of their undesirable content all these dreams must be interpreted as wish ful *filments* For the *following* dream which again was told me in order to deter me from a hasty generalization of my theory I am indebted, *not to a patient* but *to an intelligent* jurist of my acquaintance *I dream* my informant tells me *that I am walking in front of my house with a lady on my arm Here a closed carriage is waiting a man steps up to me shows me his authori ation as a police officer and requests me to follow him I ask only for time in which to arrange my affairs* The jurist then asks me Can you possibly suppo e that it is my wish to be arrested? — Of course not *I have to admit Do you happen to* know upon what charge you were arrested? — Yes I believe for infanticide — Infanticide? But you know that only a mother can commit this crime upon her new born child? — That is true — And under what circumstances did you dream this? What happened on the eve ning before? — I would rather not tell you—it is a delicate matter — But I need it other wise we must forgo the interpretation of the dream — Well then I will tell you I spent

d m i t ld mpl t ly e rs whe y t g of

As the dream of th defe ed s pper d th sm ked salmo d ams

the night not at home but in the house of a lady wh means a great deal to me When we awo e in the morning something again passed between us. Then I went to sleep again and dreamt what I have told you — The woman is married? — Yes — And you d ot wi h he to concei e? — No that m ht betray me to concei e? — No that m ht betray us. —"Then you do not practi e normal co itus —"I take the precauti n to withdraw bef re ejaculat on. — Am I to as ume that you took this pr ca tion several times during the night and that in the m rning y u were n t quite sure whether you had succeeded? — "That might be so — "Then you dream is the fulnlment of a wish. By the dream you are as sured that yo ha e not beg tte a child, or what amounts to the same thin that you ha e killed the child. I can easily demonstrate the c nnecting links D you rem mber a few days ago we were talking about the tro bles of mat rimony and about the inconsiste cy f permit ting co tus s l ng as no impregnation takes pl ce while at the same time any preventive ct c mmitted after the ovum and the semen meet and a foetus is formed is punished as crime? In this onn ction w recalled the m dieval cont oversy about th moment of time t which the soul actually enters into the foetus ince the oncept of murder becomes admiss bl only from that point onwards. Of course, too, you know the gruesom poem by Lenau which puts infantic de and birth-co tr l on the same plane — Strangely e ough, I happened, as though by chance t think of Lenau thi morning — Anothe echo of your dream. And ow I hall how you yet an ther incid tal wish fulfilme t yo dream. You walk up to your house with the lady on your rm So yo tak her home instead of pending the night at h r house as you did in reality The fact that th wish fulfilment whi h is the es sen f the dream di guises itself in such an unpleasant form, has perhaps more than on ex planation From my essay n th a tiology of anxiety eurosis you will see that I note *oitus interrup us* as o e of the f ct rs responsible fo t e development f e otic fear It wou d be onsi tent with this f aft repeated c tus of t is kind you w re l ft in an unc mf rtable frame of mind which now becomes an element of the compos tion f your dream You even mak use f this uncomfortabl tate f mind to conceal the wis fulfilment. At th same time the ment on f infanticide has ot yet bee ex plained. Why does thi crime, whi h is peculiar to females, occur to you — I will co fess t you that I was involved in such an affair years ago I was responsible for the fact that a girl tried to protect herself from the consequences of a *l a son* with me by procuring an abortion. I had nothing to do with the carrying out of her plan but for lon time I was naturally wor ried in cas the affair m ght be discovered."— I understand. This recollection furni hed a second reaso why the suppos t on that you had per formed *coitus i terruptus* clumsily must have been painful to you

A young physician, who heard this dream related in my lecture-room must ha e felt that ... ed to imitate it by ... nk ... he ... a ... men because he ... e

other statements had passed unquestioned but that his own had aroused general suspicio with the result that he would be punished with a heavy fine This dream is a poorly disguised fulfilment of th wish to be known as a phy s cian with a large income It also calls to mind the story of the youn gi l who was adv sed against accepting h r suitor becau e he was a man of quick temper who would assuredly beat her aft r their marriage Her answer was I wi h he *would* strike me! H r wi h to be married was so intense that he had taken i to cons deration the discomf rts p edicted f this marriage she had even raised them to the plan of a wish.

If I group together th very frequent dreams of this sort, which eem flatly to ontradict my theory in that they embody the denial of a wish or some occurrence obviously undesired under the head of *cou ter wish-dreams* I find that they m y all be eferred to two principles o e of which has ot yet been mentioned th ugh it plays l rg part in waking as well as dream life. One of the m tives insp ring these dreams is th wi h that I sh uld appear in the wrong These dreams occur regula ly in the c urse of treatment whe ever the pat ent is in a tat of resista ce indeed I can with a great degree of certai ty count on evoking uch a dream o ce I h e explain d t th pati nt my theory that the dream is a wish fulfilme t. Indeed I ha e reason to expect that many f

S mil *oun er wish-d* m have been repeatedly reported me within the las few years, by those who tend my lect res as t e rea ti to their first en coun er with the *w h th ory* f dreams.

my readers will have such dreams merely to fulfil the wish that I may prove to be wrong The last dream which I shall recount from among those occurring in the course of treatment once more demonstrates this very thing A young girl who had struggled hard to continue my treatment against the will of her relatives and the authorities whom they had consulted dreamt the following dream *At home she is forbidden to come to me any more She then reminds me of the promise I made her to treat her for nothing if necessary and I tell her I can show no consideration in money matters*

It is not at all easy in this case to demonstrate the fulfilment of a wish but in all cases of this kind there is a second problem the solution of which helps also to solve the first Where does she get the words which she puts into my mouth? Of course I have never told her anything of the kind but one of her brothers the one who has the greatest influence over her has been kind enough to make this remark about me It is then the purpose of the dream to show that her brother is right and she does not try to justify this brother merely in the dream it is her purpose in life and the motive of her illness

A dream which at first sight presents peculiar difficulties for the theory of wish fulfilment was dreamed by a physician (Aug Starcke) and interpreted by him *I have and see on the last phalange of my left forefinger a primary syphilitic affection*

One may perhaps be inclined to refrain from analysing this dream since it seems clear and coherent except for its unwished for content However if one takes the trouble to make an analysis one learns that *primary affection* reduces itself to *prima affectio* (first love) and that the repulsive sore in the words of Starcke proves to be the representative of wish fulfilments charged with intense emotion

The other motive for counter wish-dreams is so clear that there is a danger of overlooking it as happened in my own case for a long time In the sexual constitution of many persons there is a masochistic component which has arisen through the conversion of the aggressive sadistic component into its opposite Such people are called *ideal* masochists if they seek pleasure not in the bodily pain which may be inflicted upon them but in humiliation and psychic chastisement. It *is* obvious that such persons may have counter wish dreams and disagreeable dreams yet *these are for them* nothing more than wish fulfilments which satisfy their masochistic inclinations Here is such a dream A young man who in earlier youth greatly tormented his elder brother toward whom he was *homosexually inclined* but who has since undergone a complete change of character has the following dream which consists of three parts (1) *He is teased by his brother* (2) *Two adults are caressing each other with homosexual intentions* (3) *His brother has sold the business the management of which the young man had reserved for his own future* From this last dream he awakens with the most unpleasant feelings and yet it is a masochistic wish dream which might be translated It would serve me right if my brother were to make that sale against my interests *It* would be my punishment for all the torments he has suffered at my hands

I hope that the examples given above will suffice—until some further objection appears—to make it seem credible that even dreams with a painful content are to be analysed as wish fulfilments Nor should it be considered a mere matter of chance that in the course of interpretation one always happens upon subjects about which one does not like to speak or think The disagreeable sensation which such dreams arouse is of course precisely identical with the antipathy which would and usually does restrain us from treating or discussing such subjects—an antipathy which must be overcome by all of us if we find ourselves obliged to attack the problem of such dreams. But this disagreeable feeling which recurs in our dreams does not preclude the existence of a wish everyone has wishes which he would not like to confess to others which he does not care to admit even to himself On the other hand we feel justified in connecting the unpleasant character of all these dreams with the fact of dream-distortion and in concluding that these dreams are distorted and that their wish fulfilment is disguised beyond recognition precisely because there is a strong revulsion against—a will to repress—the subject matter of the dream or the wish created by *it* *Dream distortion* then proves in reality to be an act of censorship *We shall have included everything which the analysis of disagreeable dreams has brought to light if we reword our formula thus* *The dream is the (disguised) fulfilment of a (suppressed repressed) wish*

1 *Zentralblatt f r Psychoa ly e* Jah g II 19 1 1

I w'll be b rne th t w b t y t d posed of thi th m w sh ll d sc it g l t
A g t t mpo ry poet wh I m t ld, will be th g of psych -a lysis d dre m inter-

Now there still remain to be considered, as a particular sub-order of dreams with painful content, the anxiety-dreams, the inclusion of which among the wish-dreams will be still less acceptable to the uninitiated. But I can here deal very cursorily with the problem of anxiety-dreams; what they have to reveal is not a new aspect of the dream-problem; here the problem is that of understanding neurotic anxiety in general. The anxiety which we experience in dreams is only apparently explained by the dream-content. If we subject that content to analysis, we become aware that the dream-anxiety is no more justified by the dream-content than the anxiety in a phobia is justified by the idea to which the phobia is attached. For example, it is true that it is possible to fall out of a window, and that a certain care should be exercised when one is at a window, but it is not obvious why the anxiety in the corresponding phobia is so great, and why it torments its victims more than its cause would warrant. The same explanation which applies to the phobia applies also to the anxiety dream. In either case, the anxiety is only *fastened on to* the idea which accompanies it, and is derived from another source.

On account of this intimate relation of dream-anxiety to neurotic anxiety, the discussion of the former obliges me to refer to the latter. In a little essay on *Anxiety Neurosis*, written in 189 I maintained that neurotic anxiety has its origin in the sexual life, and corresponds to a libido which has been deflected from its object and has found no employment. The accuracy of this formula has since then been demonstrated with ever increasing certainty. From it we may deduce the doctrine that anxiety-dreams are dreams of sexual content, and that the libido appertaining to this content has been *transformed into anxiety*. Later on I shall have an opportunity of confirming this assertion by the analysis of several dreams of neurotics. In my further attempts to arrive at a theory of dreams I shall again have occasion to revert to the conditions of anxiety-dreams and their compatibility with the theory of wish-fulfilment.

V. THE MATERIAL AND SOURCES OF DREAMS

HAVING realized, as a result of analysing the dream of Irma's injection, that the dream was the fulfilment of a wish, we were immediately interested to ascertain whether we had thereby discovered a general characteristic of dreams, and for the time being we put aside every other scientific problem which may have suggested itself in the course of the interpretation. Now that we have reached the goal on this one path, we may turn back and select a new point of departure for exploring dream-problems, even though we *may for a time lose sight of the* theme of wish-fulfilment, which has still to be further considered.

Now that we are able, by applying our process of interpretation, to detect a *latent* dream-content whose significance far surpasses that of the *manifest* dream-content, we are naturally impelled to return to the individual dream-problems, in order to see whether the riddles and contradictions which seemed to elude us when we had only the manifest content to work upon may not now be satisfactorily solved.

The opinions of previous writers on the relation of dreams to waking life, and the origin of the material of dreams, have not been given here. We may recall however three peculiarities of the memory in dreams, which have been often noted, but never explained:

1. That the dream clearly prefers the impressions of the last few days (Robert, Strumpell, Hildebrandt; also Weed Hallam).

---

pression, has nevertheless derived from his own experience an almost identical formula for the nature of the dream: "Una liberated emergence of suppressed yearnings under false features and names." (C. Spitteler, *Meine frühesten Erlebnisse*, in *Süddeutsche Monatshefte*, October, 1913.)

I will here anticipate by citing the amplification and modification of this fundamental formula propounded by Otto Rank: "On the basis and with the aid of repressed infantile-sexual material, dreams regularly represent as fulfilled current, and as a rule also erotic, wishes in a disguised and symbolic form." (*Ein Traum*

psycho-analysis to the oft-repeated reproach that it asserts that *all dreams have a sexual content*. If one understands this sentence as it is intended to be understood, it only proves how little conscientiousness our critics are wont to display, and how ready our opponents are to overlook statements if they do not accord with their aggressive inclinations. Only a few pages back I mentioned the manifold wish-fulfilments of children's dreams (to make an excursion on land or water, to make up for an omitted meal, etc.). Elsewhere I have mentioned dreams excited by thirst and the desire to evacuate, and mere comfort- or convenience-dreams. Even Rank does not make an absolute assertion. He says "as a rule also erotic wishes," and this can be completely confirmed in the case of most dreams of adults.

The matter has, however, a different aspect if we employ the word *sexual* in the sense of *Eros*, as the word is understood by psycho-analysis. But the interesting problem of whether all dreams are not produced by *libidinal* motives (in opposition to *destructive* ones) has hardly been considered by our opponents.

See p. 87 above.

2 That it makes a selection in accordance with principles other than those govern ing our waking memory in that it recalls not essential and important but subor dinate and disregarded things

3 That it has at its disposal the earliest impressions of our childhood and brings to li ht details from this period of life which again seem trivial to us and which in waking life were believed to have been long since forgotten

These peculiarities in the dream s choice of material have of course been observed by previous writers in the manifest dream content

A Recent and Indifferent Impressions in the Dream

If I now consult my own experience with re gard to the origin of the elements appearing in the dream content I must in the first place express the opinion that in every dream we may find some reference to the experiences of the *preceding day* Whatever dream I turn to whether my own or somone else s this experi ence is always confirmed Knowing this I may perhaps begin the work of interpretation by looking for the experience of the preceding day which has stimulated the dream in many cases this is indeed the quickest way With the two dreams which I subjected to a close analysis in the last chapter (the dreams of Irma s injec tion and of the uncle with the yellow beard) the reference to the preceding day is so evident that it needs no further elucidation But in order to show how constantly this reference may be demonstrated I shall examine a por tion of my own dream chronicle I shall relate only so much of the dreams as is necessary for the detection of the dream source in question

1 *I pay a call at a house to which I gain admittance only with difficulty etc and mean while I am keeping a woman waiting for me*

Source A conver ation during the evening with a female relative to the effect that she would have to wait for a remittance for which she had asked until etc

I have written a monograph on a species (uncertain) of plant

Source In the mornin I had seen in a book seller s window a *monograph* on the genus Cyclamen

It d t th t R be t d —that th d m i t ded t d m m ry f th l mp i wh ch t h s ce d d g th d y— l g te abl f d ff t m mo es f h ldh d p pe d m w th m d g f f q y We sh uld be bl g d to l de that d m g ally pe form th r p c bed ta k y i d q tely

3 *I see two women in the street mother and daughter the latter being a patient*

Source A female patient who is under treat ment had told me in the evening what difficul ties her *mother* puts in the way of her continu in the treatment

4 *At S and R s bookshop I subscribe to a periodical which costs 20 florins annually*

Source During the day my wife has re minded me that I still owe her o *florins* of her weekly allowance

5 *I receive a communication from the So cial Democratic Committee in which I am ad dressed as a member*

Source I have received simultaneous *com munications* from the Liberal Committee on Elections and from the president of the Hu manitarian Society of which latter I am ac tually a member

6 *A man on a steep rock rising from the sea in the manner of Bocklin*

Source Dreyfus on Devil s Island also news from my relatives in *England* etc

The question might be raised whether a dream invariably refers to the events of the preceding day only or whether the reference may be extended to include impressions from a lon er period of time in the immediate past. This question is probably not of the first im portance but I am inclined to decide in favour of the exclusive priority of the day before the dream (the dream day) Whenever I thou ht I had found a case where an impression two or three days old was the source of the dream I was able to convince myself after careful in vestigation that this impression had been re membered the day before that is that a de monstrable reproduction on the dav before had been interpolated between the day of the event and the time of the dream and further I was able to point to the recent occa ion which might have given rise to the recollection of the older impression On the other hand I was unable to convince myself that a regular interval of biological significance (H Swoboda gives the first interval of this kind as eighteen hours) elapses between the dream exciting day time impression and its recurrence in the dream

I believe therefore that for every dream a dream stimulus may be found among these experiences on which one has not yet slept

Havelock Ellis who has likewise given at tention to th s problem states that he has not been able to find any such periodicity of re production in his dreams although he has

looked for it. He reports a dream in which he found himself in Spain; he wanted to travel to a place called *Daraus*, *Varaus* or *Zaraus*. On awaking, he was unable to recall any such place-names, and thought no more of the matter. A few months later he actually found the name Zaraus; it was that of a railway-station between San Sebastian and Bilbao, through which he had passed in the train e... months (2 o... days) before the date of the dream.

Thus the impressions of the immediate past (with the exception of the day before the night of the dream) stand in the same relation to the dream-content as those of periods indefinitely remote. The dream may select its material from any period of life, provided only that a chain of thought leads back from the experiences of the day of the dream (the recent impressions) of that earlier period.

But why this preference for recent impressions? We shall arrive at some conjectures on this point if we subject one of the dreams already mentioned to a more precise analysis. I select the

Dream of the Botanical Monograph

I have written a monograph on a certain plant. The book lies before me. I am just turning over a folded coloured plate. A dried specimen of the plant, as though from a herbarium, is bound up with every copy.

Analysis

In the morning I saw in a bookseller's window ... The C... C... ...

do. In connection with the theme of giving her flowers I am reminded of a story which I recently told to some friends of mine in proof of my assertion that we often forget in obedience to a purpose of the unconscious, and that forgetfulness always enables us to form a deduction about the secret disposition of the forgetful person. A young woman who has been accustomed to receive a bouquet of flowers from her husband on her birthday misses this token of affection on one of her birthdays, and bursts into tears. The husband comes in, and cannot understand why she is crying until she tells him "Today is my birthday." He claps his hand to his forehead, and exclaims "Oh, forgive me, I had completely forgotten it," and proposes to go out immediately in order to get her flowers. But she refuses to be consoled, for she sees in her husband's forgetfulness a proof that he no longer plays the same part in his thoughts as she formerly did. This Frau L. met my wife two days ago, told her that she was feeling well, and asked after me. Some years ago she was a patient of mine.

Supplementary facts: I did once actually write something like a monograph on a plant, namely, an essay on the coca plant, which attracted the attention of K. Koller to the anaesthetic properties of cocaine. I had hinted that the alkaloid might be employed as an anaesthetic, but I was not thorough enough to pursue the matter further. *It occurs to me, too,* that on the morning of the day following the dream (for the interpretation of which I did not find time until the evening) I had thought of cocaine in a kind of day-dream. If I were ever afflicted with glaucoma, I would go to Berlin, and there undergo an operation, incognito, in the house of my Berlin friend, at the hands of a surgeon whom he would recommend. The surgeon, who would not know the name of his patient, would boast, as usual, how easy these operations had become since the introduction of cocaine; and I should not betray the fact that I myself had a share in this discovery. With this phantasy were connected thoughts of how awkward it really is for a ... services of

d. I realize that there is concealed behind the memory of a definite event. Shortly after Koller's discovery my father contracted glaucoma; he was operated on by my friend Dr Koenigstein, the eye specialist. Dr Koller was in charge of the cocaine anaesthetization, and he made the remark that on this occasion all the three persons who had been responsible for the introduction of cocaine had been brought together.

My thoughts now pass on to the time when I was last reminded of the history of cocaine. This was a few days earlier, when I received a *Festschrift*, a publication in which grateful pupils had commemorated the jubilee of their teacher and laboratory director. Among the titles to fame of persons connected with the laboratory I found a note to the effect that the discovery of the anaesthetic properties of cocaine had been due to K. Koller. Now I suddenly become aware that the dream is connected with an experience of the previous

evening. I had just accompanied Dr Koenigstein to his home and had entered into a discussion of a subject which excites me greatly whenever it is mentioned While I was talking with him in the entrance hall Professor Gartner and his young wife came up I could not refrain from congratulating them both upon their *blooming* appearance Now Professor Gartner is one of the authors of the *Festschrift* of which I have just spoken and he may well have reminded me of it And Frau L of whose birthday disappointment I spoke a little way back had been mentioned though of course in another connection in my conversation with Dr Koenigstein

I shall now try to elucidate the other determinants of the dream content A *dried specimen* of the plant accompanies the monograph as though it were a *herbarium* And herbarium reminds me of the Gymnasium The director of our Gymnasium once called the pupils of the upper classes together in order that they might examine and clean the Gymnasium herbarium Small insects had been found—*book worms* The director seemed to have little confidence in my ability to assist for he entrusted me with only a few of the pages I know to this day that there were crucifers on them My interest in botany was never very great At my preliminary examination in botany I was required to identify a crucifer and failed to recognize it had not my theoretical knowledge come to my aid I should have fared badly indeed Crucifers suggest composites The artichoke is really a composite and in actual fact one which I might call my *favourite flower* My wife more thoughtful than I often brings this favourite flower of mine home from the market

I see the monograph which I have written lying before me Here again there is an association My friend wrote to me yesterday from Berlin I am thinking a great deal about your dream book I see it lying before me completed and I turn the pages How I envied him this power of vision! If only I could see it lying before me already completed!

The folded coloured plate When I was a medical student I suffered a sort of craze for studying monographs exclusively In spite of my limited means I subscribed to a number of the medical periodicals whose *coloured plates* afforded me much delight I was rather proud of this inclination to thoroughness When I subsequently began to publish books myself I had to draw the plates for my own treatises and I remember one of them turned out so badly that a well meaning colleague ridiculed me for it With this is associated I do not exactly know how a very early memory of my childhood My father by the way of a jest, once gave my elder sister and myself a book containing *coloured plates* (the book was a narrative of a journey through Persia) in order that we might destroy it From an educational point of view this was hardly to be commended I was at the time five years old and my sister less than three and the picture of us two children blissfully tearing the book to pieces (I should add like an *artichoke* leaf by leaf) is almost the only one from this period of my life which has remained vivid in my memory When I afterwards became a student I developed a conspicuous fondness for collecting and possessing books (an analogy to the inclination for studying from monographs a hobby alluded to in my dream thoughts in connection with cyclamen and artichoke) I became a *book worm (cf herbarium)* Ever since I have been engaged in introspection I have always traced this earliest passion of my life to this impression of my childhood or rather I have recognized in this childish scene a screen or concealing memory for my subsequent bibliophilia And of course I learned at an early age that our passions often become our misfortunes When I was seventeen I ran up a very considerable account at the bookseller s with no means with which to settle it and my father would hardly accept it as an excuse that my passion was at least a respectable one But the mention of this experience of my youth brings me back to my conversation with my friend Dr Koenigstein on the evening preceding the dream for one of the themes of this conversation was the same old reproach—that I am much too absorbed in my *hobbies*

For reasons which are not relevant here I shall not continue the interpretation of this dream but will merely indicate the path which leads to it In the course of the interpretation I was reminded of my conversation with D

[illegible] trains of thought which have been started—my own inclinations and those of my wife the cocaine the awkwardness of securing medical treatment from one s own colleagues

Cf The Psychopathology of Everyday Life

my preference for monographical t dies and my eglect of certain subjects such as botany —all these are continued in and lead up to one branch o a other of thi widely ramified con ersation The dream once more a umes the character of a justificatio of a plea for my rights (like th d eam of Irma s injection, the first to be analysed) it even ontin es the them whi h that dream introduced and discu ses it in as ociat on with the n w subject matter which has been added in the nterval between the two dreams E en the d eam s apparently indiffe ent f rm of expres on at once cquires a meaning N w t mean I am indeed th man who ha written that valuable a d suc essful tre tise (n cocain) just as ''

ing I can allow myself this But I m y dispense with the furthe interpretatio of the dream because my only purpose in recording it was t examin th relatio of th dream co tent to the xperience of the prev ous day whi h arouses t As lo as I kn w only the manifest conte t f this dream nly one re lation to any impress o of the day is obv ous

refers is an ndifferent one a subordin te cir cumstance I see a book in shop window whose titl holds me f r moment but whose content wo ld hardly interest m The second experien e wa of great psychi alu I talked earnestly with m friend the ey special st for about an hour I m d allusi ns in thi conversation whi h must ha e ruffled th feel ings f both f us and whi h m me wakened mem ries in co nection with which I was ware f a great ariety of i ner timul Further this con ersat on wa b ok ff unfini hed because som cquaintances j ined us What, ow is the relation f these two impress ons of the d y to on another and to the dream whi h f ll wed d ring the night?

In the manifest dream-content I fi d merely an allus on to the different impres on and I m thus bl to reaffirm that th dream prefers to tak up to its content experiences f a non-essential haract In the dream inter pre ation on the ontrary everythin con verges upon th important and ju tifi bly disturbing event. If I judge the sense f the dream in the only correct way a cording to the late t content which is brou ht to light in the analysis I find that I ha e unw ttin ly lighted upon a new and important discovery I see that the puzzlin theory that the dream deals only with the worthl ss odds and ends of th day s experiences has no ju tification I am al o c mpelled to contradict the ass r tion that the p chic life of the waking state is not contin ed in *the dream and that hence* th dream wastes our psych c energy on trivial mat rial. The very oppos te is true what has claimed our attention during the day dominates our dream thoughts al o and we take pains to *dream only* in connectio with uch matters as have gi en us food for thou ht during the day

Pe haps the most immediate explanation of the fact that I dream of the indifferent impres sion of the day while the impres ion which has with good rea on exc ted me causes me to dream is that here again we are dealing with the phe omeno f dream-distortion wh ch we have referred to as a psychic force pla ing the part of a ce sorship The recollection of the mo ograph on the gen s cyclamen is utilized as though it were an *allusion* to the con er sation with my friend, ju t as the mention of my patient s friend in the dream of the de f rred supper is repre ted by the allus on *smoked almon.* The only questio is by what interm diate links can the impress on of the mo ograph come to assume th relation of al lu ion to the conversation with the eye special ist ince such a relation is not at first perceptible? In the example of th deferred supper the relation is ev dent at the outset *smoked salmon* as the favourite d sh of th pat ent s friend belongs t the ci cle of ideas which the fri d personality would naturally evoke in the mind of the dreamer I u new example w re dealing with two entirely separate im pres ons which at first glance seem t have nothing in commo except indeed that they occur on the me day The m graph at tracts my attenti in the morn ng n the e ening I tak part in the co ersat on Th answer furnished by the analysis is as f ll ws S h relation betwee the two mpres o s as do n t exist f om the first are est blished subsequently between the dea-co tent of the on impress and the idea-conte t f the other I ha e already p ked out the *intermedi* ate links empha ized in th urse f writing th analys Only und me out de infl ence pe haps th ollecti of the flowers mi sed by Frau L, would th idea of the m ograph on the cyclamen ha e attached itself *to the*

idea that the cyclamen is my wife s favourite flower I do not believe that these inconspicuous thoughts would have sufficed to evoke a dream

There needs no ghost my lord come
from the grave
To tell us this

as we read in Hamlet But behold! in the analysis I am reminded that the name of the man who interrupted our conversation was *Gartner* (gardener) and that I thought his wife looked *blooming* indeed now I even remember that one of my female patients who bears the pretty name of *Flora* was for a time the main subject of our conversation It must have happened that by means of these intermediate links from the sphere of botanical ideas the association was effected between the two events of the day the indifferent one and the stimulating one Other relations were then established that of cocaine for example which can with perfect appropriateness form a link between the person of Dr Koenigstein and the botanical monograph which I have written and thus secure the fusion of the two circles of ideas so that now a portion of the first experience may be used as an allusion to the second

I am prepared to find this explanation attacked as either arbitrary or artificial What [illegible] and [illegible] the [illegible] been called not Flora but Anna? And yet the answer is not hard to find If these thought relations had not been available others would probably have been selected It is easy to establish relations of this sort as the jocular questions and conundrums with which we amuse ourselves suffice to show The range of wit is unlimited To go a step farther if no sufficiently fertile associations between the two impressions of the day could have been established the dream would simply have followed a different course another of the indifferent impressions of the day such as come to us in multitudes and are forgotten would have taken the place of the monograph in the dream would have formed an association with the content of the conversation and would have represented this in the dream Since it was the impression of the monograph and no other that was fated to perform this function this impres ion was probably that most suitable for

Still the psychological process by which, according to our exposition the indifferent experience substitutes itself for the psychologically important one seems to us odd and open to question In a later chapter we shall undertake the task of making the peculiarities of this seemingly incorrect operation more intelligible Here we are concerned only with the result of this process which we were compelled to accept by constantly recurring experiences in the analysis of dreams In this process it is as though in the course of the intermediate steps a *displacement* occurs—let us say of the psychic accent—until ideas of feeble potential by taking over the charge from ideas which have a stronger initial potential reach a degree of intensity which enables them to force their way into consciousness Such displacements do not in the least surprise us when it is a question of the transference of affective magnitudes or of motor activities That the lonely spinster transfers her affection to animals that the bachelor becomes a passionate collector that the soldier defends a scrap of coloured cloth—his flag—with his life blood that in a love affair a clasp of the hands a moment longer than usual evokes a sensation of bliss or that in *Othello* a lost handkerchief causes an outburst of rage—all these are examples of psychic displacements which to us seem incontestable But if by the same means and in accordance with the same fundamental principles a decision is made as to what is to reach our consciousness and what is to be withheld from it—that is to say what we are to think—this gives us the impression of morbidity and if it occurs in waking life we call it an *error* of thought We may here anticipate the result of a discussion which will be undertaken later namely that the psychic process which we have recognized in dream-displacement proves to be not a morbidly deranged process but one merely differing from the normal one of a more *primary* nature

Thus we interpret the fact that the dream content takes up remnants of trivial experiences as a manifestation of *dream distortion* (by displacement) and we thereupon remember that we have recognized this dream distortion as the work of a censorship operating between the two psychic instances We may therefore expect that dream analysis will constantly show us the real and psychically significant source of the dream in the events of the day the memory of which has transferred its accentuation to some indifferent memory This

conception is in complete opposition to Robert's theory, which consequently has no further value for us. The fact which Robert was trying to explain simply does not exist; its assumption is based on a misunderstanding, on a failure to substitute the real meaning of the dream for its apparent meaning. A further objection to Robert's doctrine is as follows: If the task of the dream were really to rid our memory by means of a special psychic activity of the slag of the day's recollections, our sleep would perforce be more troubled, engaged in more strenuous work, than we can suppose it to be judging by our waking thoughts. For the number of the indifferent impressions of the day against which we should have to protect our memory is obviously immeasurably large; the whole night would not be long enough to dispose of them all. It is far more probable that the forgetting of the indifferent impressions takes place without any active interference on the part of our psychic powers.

Still, something cautions us against taking leave of Robert's theory without further consideration. We have left unexplained the fact that one of the indifferent impressions of the day—indeed, even of the previous day—constantly makes a contribution to the dream content. The relations between this impression and the real source of the dream in the unconscious do not always exist from the outset; as we have seen, they are established subsequently, while the dream is actually at work, as though to serve the purpose of the intended displacement. Something, therefore, must necessitate *the opening up of connections in the direction of the recent but indifferent impression*; this impression must possess some quality that gives it a special fitness. Otherwise it would be just as easy for the dream-thoughts to shift their accentuation to some inessential component of their own sphere of ideas.

Experiences such as the following show us the way to an explanation. If the day has brought us two or more experiences which are worthy to evoke a dream, the dream will blend the allusion of both into a single whole; it obeys a *compulsion to make them into a single whole*. For example: One summer afternoon I entered a railway carriage in which I found two acquaintances of mine who were unknown to one another. One of them was an influential colleague, the other a member of a distinguished family which I had been attending in my professional capacity. I introduced the two gentlemen to each other; but during the long journey they conversed with each other through me, so that I had to discuss this or that topic now with one, now with the other. I asked my colleague to recommend a mutual acquaintance who had just begun to practise as a physician. He replied that he was convinced of the young man's ability, but that his undistinguished appearance would make it difficult for him to obtain patients in the upper ranks of society.

f

my patients—who was at this time prostrated by a serious illness. On the night following this journey I dreamt that the young friend whom I had asked one of my companions to recommend was in a fashionable drawing room, and with all the bearing of a man of the world was making—before a distinguished company, in which I recognized all the rich and aristocratic persons of my acquaintance—a funeral oration over the old lady (who in my dream had already died) who was the aunt of my second fellow-traveller. (I confess frankly that I had not been on good terms with this lady.) Thus my dream had once more found the connection between the two impressions of the day, and by means of the two had constructed a unified situation.

In view of many similar experiences, I am persuaded to advance the proposition that a dream works under a kind of compulsion which forces it to combine into a unified whole all the sources of dream-stimulation which are offered to it. In a subsequent chapter (on the function of dreams) we shall consider this impulse of combination as part of the process of condensation, another primary psychic process.

I shall now consider the question whether the dream-exciting source to which our analysis leads us must always be a recent (and significant) event, or whether a subjective experience—that is to say, the recollection of a psychologically significant event, a train of thought—may assume the role of a dream stimulus. The very definite answer derived from numerous analyses is as follows: The stimulus of the dream may be a subjective transaction, which has been made recent, as it were, by the mental activity of the day.

The tendency of the dream to work to blend every thing present of interest in a single transaction has already been noticed by several authors, for instance, by Delage and Delboeuf.

And this is perhaps the best time to sum marize in schematic form the different condi tions under which the dream sources are operative

The source of a dream may be

(*a*) A recent and psychologically significant event which is directly represented in the dream

(*b*) Several recent and significant events *which are combined by the dream in a single* whole

(*c*) One or more recent and significant events which are represented in the dream content by allusion to a contemporary but indifferent vent

(*d*) A subjectively significant experience (recollection train of thought) which is *con stantly represented in the dream by* allusion to a recent but indifferent impression

As may be seen in dream interpretation the condition is always fulfilled that one compo nent of the dream content repeats a recent impression of the day of the dream The com ponent which is destined to be represented in the dream may either belong to the same circle of ideas as the dream stimulus itself (as an essential or even an inessential element of the same) or it may originate in the neighbour hood of an indifferent impression which has been brought by more or less abundant associ ations into relation with the sphere of the dream stimulus The apparent multiplicity of these conditions results merely from the *alter native* that a *displacement has or has not oc curred* and it may here be noted that this alternative enables us to explain the contrasts of the dream quite as readily as the medical theory of the dream explains the series of states from the partial to the complete waking of the brain cells

In considering this series of sources we note further that the psychologically significant but not recent element (a train of thought a recol lection) may be replaced for the purposes of dream formation by a recent but psycholog ically indifferent element provided the two following conditions are fulfilled (1) the dream content preserves a connection with things recently experienced (2) the dream stimulus is still a psycholo ically significant event In one single case (*a*) both these con ditions are fulfilled by the same impre on. *If we now consider that these same indifferent* impressions which are utilized for the dream as long as they are recent lose this qualifica tion as soon as they are a day (or at most several days) older we are obliged to assume that the very freshness of an impression gives it a certain psychological value for dream *formation somewhat equivalent to the value* of emotionally accentuated memories or trains of thought Later on in the light of certain psychological considerations we shall be able to divine the explanation of this importance of *recent* impressions in dream formation

Incidentally our attention is here called to *the fact that at night and unnoticed by our consciousness important changes may occur in* the material comprised by our ideas and mem ories The injunction that before making a final decision in any matter one should sleep on it for a night is obviously fully justified But at this point we find that we have passed from *the psychology of dreaming to the psychology* of sleep a step which there will often be occasion to take

At this point there arises an objection which threatens to invalidate the conclusions at which we have just arrived If indifferent impressions can find their way into the dream only so long *as they are of recent origin how does it* happen that in the dream content we find elements also from earlier periods of our lives which, at the time when they were still recent pos sessed as Strumpell puts it no psychic value and which therefore ought to have been for gotten long ago elements that is which are neither fresh nor psychologically significant?

This objection can be disposed of completely if we have recourse to the results of the psycho analysis of neurotics The solution is as follows The process of shifting and rearrangement which replaces material of psychic significance by material which is indifferent (whether one is dreaming or thinking) has already taken place in these earlier periods of life and has since become fixed in the memory Those ele ments which were originally indifferent are in *fact no longer so since they have acquired the* value of psychologically significant material That which has actually remained indifferent can never be reproduced in the dream

From the *foregoing exposition the reader* may rightly conclude that I assert that there are no indifferent dream stimuli and therefore

no guileless dreams. This I absolutely and unconditionally believe to be the case, apart from the dreams of children and perhaps the brief dream reactions to nocturnal sensations. Apart from these exceptions whatever one dreams is either plainly recognizable as being psychically significant, or it is distorted and can be judged correctly only after complete interpretation, when it proves after all to be of psychic significance. The dream never concerns itself with trifles; we do not allow sleep to be disturbed by trivialities. Dreams which are apparently guileless turn out to be the reverse of innocent if one takes the trouble to interpret them; if I may be permitted the expression, they all show "the mark of the beast." Since this is another point on which I may expect contradiction, and since I am glad of an opportunity to show dream-distortion at work, I shall here subject to analysis a number of *guileless dreams* from my collection.

I

An intelligent and refined young woman who in real life is distinctly reserved, one of those people of whom one says that "still waters run deep," relates the following dream: *I dreamt that I arrived at the market too late, and could get nothing from either the butcher or the greengrocer woman.* Surely a guileless dream, but it has not the appearance of a real dream; I induce her to relate it in detail. Her report then runs as follows: *She goes to the market with her cook, who carries the basket. The butcher tells her, after she has asked him for something: "That is no longer to be obtained," and wants to give her something else, with the remark: "That is good, too." She refuses, and goes to the greengrocer woman. The latter tries to sell her a peculiar vegetable which is bound up in bundles, and is black in colour. She says: "I don't know that; I won't take it."*

The connection of the dream with the preceding day is simple enough. She had really gone to the market too late, and had been unable to buy anything. *The meat-shop was already closed* comes into one's mind as a description of the experience. But wait; is not that a very vulgar phrase which—or rather the opposite of which—denotes a certain neg

lect with regard to a man's clothing? The dreamer has not used these words; she has perhaps avoided them; but let us look for the interpretation of the details contained in the dream.

When in a dream something has the character of a spoken utterance—that is, when it is said or heard, not merely thought—and the distinction can usually be made with certainty—then it originates in the utterances of waking life, which have, of course, been treated as raw material, dismembered, and slightly altered, and above all removed from their context. In the work of interpretation we may take such utterances as our starting point. Where, then, does the butcher's statement, *That is no longer to be obtained*, come from? From myself; I had explained to her some days previously "that the oldest experiences of childhood are no longer to be obtained as such, but will be replaced in the analysis by transferences and dreams." Thus, I am the butcher, and she refuses to accept these transferences to the present of old ways of thinking and feeling. Where does her dream utterance, *I don't know that; I won't take it*, come from? For the purposes of the analysis this has to be dissected. *I don't know that* she herself had said to her cook, with whom she had a dispute on the previous day, but she had then added: *Behave yourself decently.* Here a displacement is palpable; of the two sentences which she spoke to her cook she included the insignificant one in her dream; but the suppressed sentence, *Behave yourself decently!* alone fits in with the rest of the dream-content. One might use the words to a man who was making indecent overtures, and ... mention. The

up in bundles (a longish vegetable, as she subsequently adds), and is also black: what can this be but a dream-combination of asparagus and black radish? I need not interpret asparagus to the initiated; and the other vegetable, too (think of the exclamation: "Blacky, save yourself!"), seems to me to point to the sexual theme at which we guessed in the beginning, when we wanted to replace the story of the dream by "the meat-shop is closed." We are not

Havelock Ellis, a kindly critic of *The Interpretation of Dreams*, writes in *The World of Dr*...

Cf. what is said of speech in dreams in the chapter "The Dream-Work." Only one of the writers on the subject—Delboeuf—seems to have recognized the origin of the speeches heard in dreams; he compares them with *clichés*.

here concerned with the full meaning of the dream so much is certain that it is full of meaning and by no means guileless

II

Another guileless dream of the same patient which in some respects is a pendant to the above *Her husband asks her Oughtn t we to have the piano tuned? She replies It s not worth while the hammers would have to be rebuffed as well* Again we have the reproduction of an actual event of the preceding day Her husband had asked her such a question and she had answered it in such words But what is the meaning of her dreamin it? She says of the piano that it is a *disgusting* old box which has a bad tone it *belonged* to her husband before they were married etc but the key to the true solution lies in the phrase *It isn t worth while* This has its origin in a call paid yesterday to a woman friend She was asked to take off her coat but declined saying Thanks it isn t worth while I must go in a moment At this point I recall that yesterday during the analysis she suddenly took hold of her coat of which a button had come undone It was as though she meant to say Please don t look in it isn t worth while Thus *box* becomes *chest* and the interpretation of the dream leads to the years when she was growing out of her childhood when she began to be dissatisfied with her figure It leads us back indeed to earlier periods if we take into consideration the *disgusting* and the *bad tone* and remember how often in allusions and in dreams the two small hemispheres of the female body take the place—as a substitute and an antithesis—of the large ones

III

I will interrupt the analysis of this dreamer in order to insert a short innocent dream which was dreamed by a young man *He dreamt that he was putting on his winter overcoat again this was terrible* The occasion for this dream is apparently the sudden advent of cold weather On more careful examination we note that the two brief fragments of the dream do not fit together very well for what could be terrible about wearing a thick or heavy coat in cold weather? Unfortunately for the innocency of this dream the first association under analysis yields the recollection that yesterday a lady had confidentially confessed to him that her last child owed its existence to the splitting of a condom He now reconstructs his thoughts in accordance with this suggestion A thin condom is dangerous a thick one is bad The condom is a pullover (*Ueber zieher*= literally *pullover)* for it is pulled over something and *Ueber zieher* is the German term for a light overcoat An experience like that related by the lady would indeed be terrible for an unmarried man

We will now return to our other innocent dreamer

IV

She puts a candle into a candlestick but the candle is broken so that it does not stand up The girls at school say she is clumsy but she replies that it is not her fault

Here too there is an actual occasion for the dream the day before she had actually put a candle into a candlestick but this one was not broken An obvious symbolism has here been employed The candle is an object which excites the female genitals its being broken *so that it does not stand upright* signifies impotence on the man s part (*it is not her fault*) But does this young woman carefully brought up and a stranger to all obscenity know of such an application of the candle? By chance she is able to tell how she came by this information While paddling a canoe on the Rhine a boat passed her which contained some students who were singing rapturously or rather yelling When the Queen of Sweden behind clo ed shutters with the candles of Apollo

She does not hear or else understand the last word Her husband was asked to give her the required explanation These verses are then replaced in the dream content by the innocent recollection of a task which she once performed *clumsily* at her boarding school becau e of the *closed shutters* The connection between the theme of masturbation and that of impotence is clear enough *Apollo* in the latent dream con-

Fo th u I m y em k that b h d the

A s b tit t o by w pp s
an lysis

ten connects this dream with an earlier one in which the virgin Pallas figured. All this is obviously not innocent.

V

Lest it may seem too easy a matter to draw conclusions from dreams concerning the dreamer's real circumstances I add another dream originating with the same person, which once more appears innocent. *I dreamt I doing something*, she relates, "*which I actually did during the day, that is to say, I filled a little trunk so full of books that I had difficulty in closing it. My dream was just like the actual occurrence.*" Here the dreamer herself emphasizes the correspondence between the dream and the reality. All such criticisms of the dream, and comments on the dream, although they have found a place in the waking thoughts properly belong to the latent dream-content, as further examples will confirm. We are told, then, that what the dream relates has actually occurred during the day. It would take us too far afield to show how we arrive at the idea of making use of the English language to help us in the interpretation of this dream. Suffice it to say that it is again a question of a little box (cf. p. [illegible] the dream of the dead child in the box) which has been filled so full that nothing can go into it.

In all these innocent dreams the sexual factor as the motive of the censorship is very prominent. But this is a subject of primary significance which we must consider later.

B. *Infantile Experiences as the Source of Dreams*

As the third of the peculiarities of the dream content, we have adduced the fact, in agreement with all other writers on the subject (excepting Robert) that impressions from our childhood may appear in dreams, which do not seem to be at the disposal of the waking memory. It is, of course, difficult to decide how seldom or how frequently this occurs, because after waking, the origin of the respective elements of the dream is not recognized. The proof that we are dealing with impressions of our childhood must thus be adduced objectively, and only in rare instances do the conditions favour such proof. The story is told by A. Maury as being particularly conclusive, of a man who decides to visit his birthplace after an absence of twenty years. On the night before his departure he dreams that he is in a totally unfamiliar locality, and that he there meets a strange man with whom he holds a conversation. Subsequently, upon his return home, he is able to convince himself that this strange locality really exists in the vicinity of his home, and the strange man in the dream turns out to be a friend of his dead father's, who is living in the town. This is, of course, a conclusive proof that in his childhood he had seen both the man and the locality. The dream, moreover, is to be interpreted as a dream of impatience, like the dream of the girl who carries in her pocket the ticket for a concert, the dream of the child whose father had promised him an excursion to the Hameau (p. 192) and so forth. The motives which reproduce just these impressions of childhood for the dreamer cannot, of course, be discovered without analysis.

One of my colleagues who attended my lectures, and who boasted that his dreams were very rarely subject to distortion, told me that he had sometime previously seen, in a dream, *his former tutor in bed with his nurse*, who had remained in the household until his eleventh year. The actual location of this scene was realized even in the dream. As he was greatly interested, he related the dream to his elder brother, who laughingly confirmed its reality. The brother said that he remembered the affair very distinctly, for he was six years old at the time. The lovers were in the habit of making him, the elder boy, drunk with beer whenever circumstances were favourable to their nocturnal intercourse. The younger child, our dreamer, at that time three years of age, slept in the same room as the nurse, but was not regarded as an obstacle.

In yet another case it may be definitely established without the aid of dream-interpretation, that the dream contains elements from childhood—namely, if the dream is a so-called *perennial* dream, one which, being first dreamt in childhood, recurs again and again in adult years. I may add a few examples of this sort to those already known, although I have no personal knowledge of perennial dreams. A physician in his thirties tells me that a yellow lion, concerning which he is able to give the most precise information, has often appeared in his dream-life, from his earliest childhood up to the present day. This lion, known to him from his dreams, was one day discovered *in natura* as a long-forgotten china animal. The young man then learned from his mother that the lion had been his favourite toy in early childhood, a fact which he himself could no longer remember

If we now turn from the manifest dream content to the dream thoughts which are revealed only on analysis the experiences of childhood may be found to recur even in dreams whose content would not have led us to suspect anything of the sort I owe a particularly delightful and instructive example of such a dream to my esteemed colleague of the yellow lion After reading Nansen s account of his polar expedition he dreamt that he was giving the intrepid explorer electrical treatment on an ice floe for the sciatica of which the latter complained! During the analysis of this dream he remembered an incident of his childhood without which the dream would be wholly unintelligible When he was three or four years of age he was one day listening attentively to the conversation of his elders they were talking of exploration and he presently asked his father whether exploration was a bad illness He had apparently confounded *Reisen* (journey trips) with *Reissen* (gripes tearing pains) and the derision of his brothers and sisters prevented his ever forgetting the humiliating experience

We have a precisely similar case when in the analysis of the dream of the monograph on the genus cyclamen I stumble upon a memory retained from childhood to the effect that when I was five years old my father allowed me to destroy a book embellished with coloured plates It will perhaps be doubted whether this recollection really entered into the composition of the dream content and it may be suggested that the connection was established subsequently by the analysis But the abundance and intricacy of the associative connections vouch for the truth of my explanation cyclamen—favourite flower—favourite dish—artichoke to pick to pieces like an artichoke leaf by leaf (a phrase which at that time one heard daily *a propos* of the dividing up of the Chinese empire) herbarium—bookworm whose favourite food is books I can further assure the reader that the ultimate meaning of the dream which I have not given here is most intimately connected with the content of the scene of childish destruction

In another series of dreams we learn from analysis that the very wish which has given rise to the dream and whose fulfilment the dream proves to be has itself originated in childhood so that one is astonished to find that *the child with all his impulses survives in the dream*

I shall now continue the interpretation of a dream which has already proved instructive I refer to the dream in which my friend R is my uncle We have carried its interpretation far enough for the wish motive—the wish to be appointed professor—to assert itself palpabl and we have explained the affection felt for my friend R in the dream as the outcome of opposition to and defiance of the two colleagues who appear in the dream thoughts The dream was my own I may therefore continue the analysis by stating that I did not feel quite satisfied with the olution arrived at I knew that my opinion of these colleagues who were so badly treated in my dream thoughts would have been expressed in very different language in my waking life the intensity of the wish that I might not share their fate as regards the appointment seemed to me too slight fully to account for the discrepancy between my dream opinion and my waking opinion If the desire to be addressed by another title were really so intense it would be proof of a morbid ambition which I do not think I cherish, and which I believe I was far from entertaining I do not know how others who think they know me would judge me perhaps I really was ambitious but if I was my ambition has long since been transferred to objects other than the rank and title of *Professor extraordinarius*

Whence then the ambition which the dream has ascribed to me? Here I am reminded of a story which I heard often in my childhood that at my birth an old peasant woman had prophesied to my happy mother (whose first born I was) that she had brought a great man into the world Such prophecies must be made very frequently there are so many happy and expectant mothers and so many old peasant women and other old women who since their mundane powers have deserted them turn their eyes toward the future and the prophetess is not likely to suffer for her prophecies Is it possible that my thirst for greatness has originated from this source? But here I recollect an impression from the later years of my childhood which might serve even better as an explanation One evening at a restaurant on the Prater where my parents were accustomed to take me when I was eleven or twelve years of age we noticed a man who was going from table to table and for a small sum improvising verses upon any subject that was given him I was sent to bring the poet to our table and he showed his gratitude Before asking for a subject he threw off a few rhymes about myself

became aealoo pilgrim to Rome.

disease) The occasion for this dream was the proposal of my Berlin friend that we should meet in Prague at Easter A further association with sugar and diabetes might be found in the matters which I had to discuss with him

A fourth dream occurring shortly after the last mentioned brings me back to Rome I ee a street corner before me and am aston ished that so many German placards should be posted there On the previous day when writ ing to my friend I had told him with truly prophetic vision that Prague would probably not be a comfortable place for German travel lers The dream therefore expressed simulta neou ly the wish to meet him in Rome instead of in the Bohemian capital and the desire which probably originated during my student days that the German language mi ht be ac corded more tolerance in Prague As a matter of fact I must have understood the Czech lan guage in the first years of my childhood for I was born in a small village in Moravia amidst a Slav population A Czech nursery rhyme which I heard in my seventeenth year became without effort on my part so imprinted upon my memory that I can repeat it to this day although I have no idea of its meaning Thus in these dreams also there is no lack of mani fold relations to the impressions of my early childhood

During my last Italian journey which took me past Lake Trasimenus I at length discov ered after I had seen the Tiber and had reluc tantly turned back some fifty miles from Rome what a reinforcement my longing for the Eter nal City had received from the impressions of my childhood I had just conceived a plan of travelling to Naples via Rome the following year when this sentence which I must have read in one of our German classics occurred to me It is a question which of the two paced to and fro in his room the more impa tiently after he had conceived the plan of go ing to Rome—Assistant Headmaster Winckel mann or the great General Hannibal I my self had walked in Hannibal s footsteps like him I was destined never to see Rome and he too had gone to Campania when all were ex pecting him in Rome Hannibal with whom I had achieved this point of similarity had been my favourite hero during my years at the Gymnasium like so many boys of my age I bestowed my sympathies in the Punic war not on the Romans but on the Carthaginians Moreover when I finally came to realize the consequences of belonging to an alien race and was forced by the anti Semitic feel among my class mates to take a definite stand the figure of the Semitic commander assumed still greater proportions in my imagination Hannibal and Rome symbolized in my youth ful eyes the stru gle between the tenacity of the Jews and the organization of the Catholic Church The significance for our emotional life which the anti Semitic movement has since assumed helped to fix the thoughts and im pressions of those earlier days Thus the de sire to go to Rome has in my dream life be come the mask and symbol for a number of warmly cherished wishes for whose realization one had to work with the tenacity and single mindedness of the Punic general though their fulfilment at times seemed as remote as Han nibal s life long wish to enter Rome

And now for the first time I happened upon the youthful experience which even to-day still expresses its power in all these emotions and dreams I might have been ten or twelve years old when my father began to take me with him on his walks and in his conversation to reveal his views on the things of this world Thus it was that he once told me the following incident in order to show me that I had been born into happier times than he When I was a young man I was walkin one Saturday along the street in the village where you were born I was well dressed with a new fur cap on my head Up comes a Christian who knocks my cap into the mud and shouts Jew get off the pavement! — And what did you do? — I went into the street and picked up the cap he calmly replied That did not seem heroic on the part of the big strong man who was leading me a little fellow by the hand I con trasted this situation which did not please me with another more in harmony with my senti ments—the scene in which Hannibal s father Hamilcar Barcas made his son swear before the household altar to take vengeance on the Romans Ever since then Hannibal has had a place in my phantasies

I think I can trace my enthusiasm for the C h

Th wr ter wh se w ks I fo d th p sage was p ob bly J a P l R hte

And pe haps th devel opment f this martial deal may be tra ed yet f rther back, to the first three years of my childhood to wis es whi h my alternately f endly and h stile relati ns with a boy a year olde than myself must ha e evoked in the weak r of th two playmate

The deeper we g into th analysis of dreams th more often re we put on th track f childish experien es which play the part of dream sources in the latent dream-co tent.

We ha e le rned that dreams very rarely reproduce m mories in su h a manner as to constitute uncha ged d unabridged the sole — — Neverth l a few

childhood In the case f o e of m patien s dream ce ga e b rely distorted reproduct o of sexual inc dent, wh h wa m mediately recognized as an accurate re oll c tion. The mem ry of t had never been c m pletel lost in the waking life b t t had been greatly obscured d it was rev ified by th previous wo k f analysis. The dream had at the a e f twel e visited bedridd chool

the member f the oth r boy who howeve looked t him in surprise and indignation whereupon he becam embarrassed and let t go A dream repeated this scene twenty three years later with all th d tails of the om panying emot ons changing t, howe r in this respect that the dream r pla ed the pa e instead of the ctive r whil the person of t e choolma was replaced by a contemporary

A a rule of course een from childhood is represented in th man fest dream- tent only by an ll on and m st be disentangled from the dream by interpretation The citation of examples of this kind cannot be ery con vincing becau e any guarantee that they are really experiences of childhood s lackin if they belong to an earlier period of life they are no longer recognized b our mem ry The conclusion that such childi h experiences re cu at all in dreams s justified in psycho-analytic work by a great number of f ctors whi h in their combined results appear to be sufficiently reliable But when for the pur poses f dream interpretation such references to childish experiences are torn out of their co text they may not perhaps seem very im pre sive especially where I do not even gi e all the mat rial upon which the interpretation is based However I shall not let this deter me from givin a few examples.

I

W th o e of m f male patients all dreams ha e the character of *hurry* he is hurryin so as to be n time, so as not to miss her train, and so on In one dream *she h s to visit a girl friend her moth had to d her to ri e and not walk she runs however a d keeps on f lling* The material that emerged in the analysis al lowed o e to recognize a memory of childi h romping and, especially fo one dream went back to the popular childish game of rapidly repeating the w rds of a senten e as tho gh it was all o e word All these harmless jokes with little friends were remembered because they replaced other less harmless ones

II

The foll wing dream wa dreamed by another female patient *She is in large om i which there a e ll sorts of mach nes it is ather l ke wh t she would imagine an thopaedic inst t te to be She hears that I am press d fo t me nd th t she must undergo t e tment along with fi others B t she sists and unwilling to lie down on the b d—or whateve it is—wh ch is tend d for her She st nds n a corner and waits for me to s y It is not true The thers meanwhile la gh at her saying t is all foolish ess o her part At the same t me t is as tho gh sh were called upon t m k mber of l ttle sq are*

Th first part f the c tent of thi dream is an allu n to the treatment and t the transference t myself Th econd contains an

The Jewish descen f the M rsal is somewhat doubtful.

I the riginal t paragra h contains ma y plays t e rd H (hurry chase scurry game etc.) — TR.

allusion to a scene of childhood the two por tions are connected by the mention of the bed The orthopaedic institute is an allusion to one of my talks in which I compared the treat ment with re ard to its duration and its na ture to an orthopaedic treatment At the be ginning of the treatment I had to tell her that *for tl e present I had little time to give her* but that later on I would devote a whole hour to her daily This aroused in her the old sensi tiveness which is a leading characteristic of children who are destined to become hysterical Their desire for love is insatiable My patient was the youngest of six brothers and sisters (hence *with five others*) and as such her father s favourite but in spite of this she seems to have felt that her beloved father de voted far too little time and attention to her Her waiting for me to say *It is not true* was derived as follows A little tailor s apprentice had brought her a dress and she had given him the money for it Then she asked her hus band whether she would have to pay the money again if the boy were to lose it To tease her her husband answered Yes (the *teasing* in the dream) and she asked again and again and *waited for him to say It is not true* The thought of the latent dream content may now be construed as follows Will she have to pay me double the amount when I devote twice as much time to her?—a thought which is stingy or *filthy* (the uncleanliness of childhood is often replaced in dreams by greed for money the word *filthy* here supplies the bridge) If all the pa sage referring to her waiting until I say *It is not true* is intended in the dream as a circumlocution for the word *dirty the stand ing in the corner and not lying down on the bed* are in keeping with this word as compon ent parts of a scene of her childhood in which she had soiled her bed in punishment for which *she was put into the corner* with a warn ing that papa would not love her any more whereupon her brothers and sisters laughed at her etc The little squares refer to her young niece who showed her the arithmetical trick of writing figures in nine squares (I think) in such a way that on being added together in any direction they make fifteen

III

Here is a man s dream *He sees two boys tuss ling with each other they are cooper's boys as he concludes from the tools which a e lying about one of the boys has thrown the other down the prostrate boy is wearing ear rings with blue stones He runs towards the assail ant with lifted cane in order to chastise him. The boy takes refuge behind a woman as though she were his mother who is standing against a wooden fence She is the wife of a day labourer and she turns her back to the man who is dreaming Finally she turns about and stares at him with a horrible look so that he runs away in terror the red flesh of the lower lid seems to stand out from her eyes*

This dream has made abundant use of triv ial occurrences from the previous day in the course of which he actually saw two boys in the street one of whom threw the other down. When he walked up to them in order to settle the quarrel both of them took to their heels Cooper s boys—this is explained only by a subsequent dream in the analysis of which he used the proverbial expression *To knock the bottom out of the barrel* Ear rings with blue stones according to his observation are worn chiefly by *prostitutes* This suggests a familiar doggerel rhyme about two boys The other boy was called Marie that is he was a girl The woman standing by the fence after the scene with the two boys he went for a walk along the bank of the Danube and taking ad vantage of being alone urinated *against a wooden fence* A little farther on a respectably dressed elderly lady smiled at him very pleas antly and wanted to hand him her card with her address

Since in the dream the woman stood as he had stood while urinating there is an allusion to a woman urinating and this explains the *horrible look* and the prominence of the red flesh which can only refer to the genitals gaping in a squatting posture seen in child hood they had appeared in later recollection as *proud flesh* as a *wound* The dream unites two occasions upon which as a little boy the dreamer was enabled to see the genitals of little girls once by throwin the little girl down and once while the child was *u inating* and as is shown by another association he had retained in his memory the punishment admin istered or threatened by his father on account of these manifestations of sexual curiosity

IV

A great mass of childish memories which have been hastily combined into a phantasy may be found behind the following dream of an elderly lady *She goes out in a hurry to do some shopping On the G aben she sinks to her knees as though she had broken down A*

number of people collect around her especially cab-drivers but o one helps her to get up She makes many va n attempts finally she must have succeeded for she is put nto a cab which is to take her home A larg he vily Lden basket (something l ke a mark t basket) is th own after her th o gh the wi dow

This is the woman who is always harassed in her dreams just as he used to be harassed when a child. The first tuation of the d eam is pparently taken f om the sight f a fallen horse just as *broken down* po nts t horse racing In h r youth he was a ride still earlier she was probably al o a *hors* W th the idea of falling down is connected h r first childish reminiscenc of th seventeen year old son of th hall porte who had an epileptic seizure i th street and was brou ht home in a cab Of this of course he had only heard b t the idea of epileptic fits of *fall g down* acquired a great infl e ce over her phantasies and later on infl enced th form of her wn hysterical attacks. When person f th female se dreams of falling this almost always has a sexual significance sh bec mes a *fallen woma* and for the purpose of the dream und r consid ratio this interpretati n is probably the least d btful, for she falls in the Graben, the st eet in V enna which is known as the con urse f prostitutes The *market basket* dmits f m re than on nterp tat on in th sense of refusal (German *K b*=basket =snub refus l) t reminds h r f the many snubs which he at first admini t red to h r suit rs and which, she thinks he h rself re ce ved l er This agrees with the detail *no one will help her p* which she h rself t rprets as *bei g disdained* Furth r the *market ba ket* recalls phantasies which ha e already appeared in the course f analys s, wh ch she imagin s that she has married f beneath her tat on and now goes to the market as a market woman. Lastly the market-ba k t might be interpreted as the mark of a *serva t* Thi su gest further mem ries of her childhood—of a *cook* wh was discharged because sh t le *a e too sank to her knees* and begged for mercy Th dreame was at that time tw l e years f ge Then em rges a re llecti f a chambe maid wh was dismissed because she had an with the coachman of the household wh incidentally married her ft r

explained the throwing of the basket in par

h he wi dow?

lug age

in the

a sum

mer resort, of a gentleman threw some blue plums into the window of a lady s room and of her little si ter who was frightened because an di t who was passing looked in at the window And now from behind all this emerges an ob cure recollection from her tenth year of nurse in the country to whom one of the men ervants made love (and whose conduct the child may have noticed) and who was sent packing thrown o t together with her lover (in the dream we ha e the expression *th own into*) an incident which we have been approachi g by several ther paths The luggage or bo of a servant is disparagingly described in V enna as e en plums "Pack up your seven plums and get out!

My collection of course contains a plethora of such patients dreams the analysis of which leads back to imp ess ons of childhood, often dating back to th first three years of life which are remembered obscurely or not at all. But it is a questionable proceeding to draw conclusions from these and apply them to

f the neuros s and not by the nat e of dreams in ge ral In the interpretation of my own dreams however which is assuredly not undertaken o account of gra symptoms of illness it happens ju t as freque tly that in the late t dream-content I am unexpectedly co fro ted with a scene of my childhood and that a whol eries of my dreams will suddenly co rg upo the paths proceeding from a single childi h experience I ha e lready given examples of thi and I shall gi e yet m re in different conn ctions Perhaps I cannot close this chapt r more fittingly than by citing several dreams f my own, in which recent events a d long forgotten experiences of my childhood appea together as d eam-sources

I Afte I ha been tra elling and have

gone to bed hungry and tired the prime necessities of life begin to assert their claims in sleep and I dream as follows *I go into a kitchen in order to ask for some pudding There three women are standing one of whom is the hostess she is rolling something in her hands as though she were making dumplings She replies that I must wait until she has finished* (not distinctly as a speech) *I become impatient and go away affronted I want to put on an overcoat but the first I try on is too long I take it off and am somewhat astonished to find that it is trimmed with fur A second coat has a long strip of cloth with a Turkish design sewn into it A stranger with a long face and a short pointed beard comes up and prevents me from putting it on declaring that it belongs to him I now show him that it is covered all over with Turkish embroideries He asks How do the Turkish (drawings strips of cloth) concern you? But we soon become quite friendly*

In the analysis of this dream I remember quite unexpectedly the first novel which I ever read or rather which I began to read from the end of the first volume when I was perhaps thirteen years of age I have never learned the name of the novel or that of its author but the end remains vividly in my memory The hero becomes insane and continually calls out the names of the three women who have brought the greatest happiness and the greatest misfortune into his life Pelagie is one of these names I still do not know what to make of this recollection during the analysis Together with the three women there now emerge the three Parcae who spin the fates of men and I know that one of the three women the hostess in the dream is the mother who gives life and who moreover as in my own case gives the child its first nourishment Love and hunger meet at the mother s breast A young man—so runs an anecdote—who became a great admirer of womanly beauty once observed when the conversation turned upon the handsome wet nurse who had suckled him as a child that he was sorry that he had not taken better advantage of his opportunities I am in the habit of using the anecdote to elucidate the factor of retrospective tendencies in the mechanism of the psychoneuroses One of the Parcae then is rubbing the palms of her hands together as though she were making dumplings A strange occupation for one of the Fates and urgently in need of explanation! This explanation is furnished by another and earlier memory of my childhood When I was six years old, and receiving my first lessons from my mother I was expected to believe that we are made of dust and must therefore return to dust. But this did not please me and I questioned the doctrine Thereupon my mother rubbed the palms of her hands together—just as in making dumplings except that there was no dough between them—and showed me the blackish scales of *epidermis* which were thus rubbed off *as a proof that it is of dust that we are made.* Great was my astonishment at this demonstration *ad oculos* and I acquiesced in the idea which I was later to hear expressed in the words Thou owest nature a death Thus the women to whom I go in the kitchen as I so often did in my childhood when I was hungry and my mother sitting by the fire admonished me to wait until lunch was ready are really the Parcae And now for the dumplings! At least one of my teachers at the University—the very one to whom I am indebted for my *histological* knowledge (*epidermis*)—would be reminded by the name *Knodl* (*Knodl* means dumplin) of a person whom he had to prosecute for *plagiarising* his writings Committing a plagiarism taking anything one can lay hands on even thou h it belon s to another obviously leads to the second part of the dream in which I am treated like the *overcoat thief* who for ome time plied his trade in the lecture halls I have written the word *plagiarism*—without definite intention—because it occurred to me and now I see that it must belong to the latent dream content and that it will serve as a bridge between the different parts of the manifest dream content. The chain of associations — *Pélagie* — *plagiarism* — *plagiostomi* (sharks)—*fish bladder*—connects the old novel with the affair of Knodl and the overcoats (German *Uberzieher*=pullover overcoat or condom) which obviously refer to an appliance appertaining to the technique of sex This it is true is a very forced and irrational connection but it is nevertheless one which I could not have established in waking life if it had not already been established by the dream work Indeed as though nothing were sacred to this impulse to enforce associations the beloved name *Brucke* (bridge of word see above)

Both th ffects pertai g to th se childish scenes — t hm t d re gn t t th t ble— p rst

t h

now serves to remind me of the very institute in which I spent my happiest hours as a student wa..m f r nothme "So will you at the *breasts* of Wisdom every day more pleasure find") in the most complete contrast to the desires which plague me (German *plagen*) wh.. I dream. And finally there em rges the recollection of another dear teacher whose name once more sounds like something edible (*Fleischl—Fleisch* = meat—like *Knodl* = dumplings) and f pathetic scene in which the scales of epidermis play a part (mother—hostess) and mental derangement (the novel) and a remedy from the Latin pharmacopeia (*K ke* = kitchen) which numbs the sensation of *hunger* namely cocain

In this manner I could follow the intricate trains of thought till farther and could fully elucidate that part of the dream which is lacking in the analysis but I must refrain, because the personal sacrifice which this would involve is too great. I shall take up only one of the threads which will serve t lead us directly to one of the dream thoughts that lie at the bottom f the medley The stranger with th l g f ce and pointed beard, who wants to prevent me from putting on the overcoat, has the features f a tradesman of Spalat of whom my wife bought a great deal f *Turkish* cloth. His name was *P povil* a suspicious name wh.ch even ga e the humorist Stettenheim pretext for a suggestive remark He told me his name and blushingly shook m hand.* For the rest, I find the sam misuse of names as bove in the case f *Pl ge Knodl Bru ke Fleischl* No one will deny that such playing with names is a childish trick if I indulge in t the practice amounts to n act of retribution, f r my wn name has ften enou h been the subject of such feeble attempts at wit Goethe once remarked how sensitive man is in respect t his nam which he feels that he fills even as he fills his kin H rde having written the f llowing lines on his name

Der d von G t ern ab t wm t on
G ken oder m Fo e
S ud hr G tterb er cu k St ub
(Thou wh art born f the gods f th
G th or f the mud
Thus thy godlik mag even dust)

I realize that this digression on the misuse f names was intended merely to justify this complaint. But here let us stop The purchase at Spalato reminds me of another purchase at Cattaro where I was too cautious and missed the opportunity of makin an excellent bargain. (Missing an opportunity at the breast of the wet nurse see above.) One of the dream-thoughts occasioned by the sensation of hunger really amounts to this We should let nothing escape we should take what we can get, even if we do a little wrong we should never let an opportunity go by life is o hort and death inevitable. Because this is meant even sexually and because desire is unwilling to check tself before the thou ht of d ing wrong this philosophy of *carpe d em* has reason to fear the censorship and must conceal tself behind a dream. And so all orts of counter thoughts find xpression with recollections of the time when *spirit l nourishment* alone was suffici t fo the dreamer with hindrances of every kind and even threats of disgusting sexual punishments

II. A second dream requires a longer preliminary statement

I had driven to the Western Station in order t start on a holiday trip to the Aussee but I went on to the platform in time for the Ischl train which leaves ea lier There I saw Count Thun, who was again going t see th Empe or at Ischl. In spite f th rain h rr ved in an open carriage, came traight through the entrance gate for the local trains and with a curt gesture and n t a word of explanation he waved ba k the gatekeeper who did not know him and wanted t take his ticket. After he had left in the Ischl train, I was asked to leave the platform and return to th waiting room but after some difficulty I btained permission t remain. I passed th tim noting how many people bribed the officials to secure a ompartment I fully inte ded t make a complaint—that is to demand the same privilege. Meanwhile I sang something to myself which I afterwards recognized as the aria from *The Marriage f F garo*

If my lord Count would t ead a measure
t ead a measure
Let h m but s y his pl asure
A d I will pl y the tune

(Possibly other person would not ha e recognized the tune)

The whol evening I was in a h h-spirited pugnacious mood I chaffed the waiter and the cab-driver I hope without hurting their feelings and now all kinds of bold and revolutionary thoug ts came int my mind, such as

* *P pov* backside in German nursery language.

would fit themselves to the words of Figaro and to memories of Beaumarchais comedy of which I had seen a performance at the *Comédie Française* The speech about the great men who have taken the trouble to be born the seigneurial right which Count Almaviva wishes to exercise with regard to Susanne the jokes which our malicious Opposition journalists make on the name of Count Thun (German *thun*=do) calling him Graf Nichtsthun Count Do Nothing I really do not envy him he now has a difficult audience with the Emperor before him and it is I who am the real Count Do Nothing for I am going off for a holiday I make all sorts of amusing plans for the vacation Now a gentleman arrives whom I know as a Government representative at the medical examinations and who has won the flattering nickname of the Governmental bed fellow (literally *by sleeper*) by his activities in this capacity By insisting on his official status he secured half a first class compartment and I heard one guard say to another Where are we going to put the gentleman with the first class half compartment? A pretty sort of favouritism! I am paying for a whole first class compartment I did actually get a whole compartment to myself but not in a through carriage so there was no lavatory at my disposal during the night My complaints to the guard were fruitless I revenged myself by suggesting that at least a hole be made in the floor of this compartment to serve the possible needs of passengers At a quarter to three in the morning I wake with an urgent desire to urinate from the following dream

A crowd a students meeting A certain Count (Thun or Taaffe) is making a speech Being asked to say something about the Germans he declares with a contemptuous gesture that their favourite flower is coltsfoot and he then puts into his buttonhole something like a torn leaf really the crumpled skeleton of a leaf I jump up and I jump up but I am surprised at my implied attitude Then more indistinctly *It seems as though this were the vestibule (Aula) the exits are thronged and one must escape I make my way through a suite of handsomely appointed rooms evidently ministerial apartments with furniture of a colour between brown and violet and at last I come to a corridor in which a housekeeper a fat elderly woman is seated I try to avoid speaking to her but she apparently thinks I have a right to pass this way because she asks whether she shall accompany me with the lamp I indicate with a gesture or tell her that she is to remain standing on the stairs and it seems to me that I am very clever for after all I am evading detection Now I am downstairs and I find a narrow steeply rising path which I follow*

Again indistinctly *It is as though my second task were to get away from the city just as my first was to get out of the building I am riding in a one horse cab and I tell the driver to take me to a railway station I can t drive with you on the railway line itself I say when he reproaches me as though I had tired him out Here it seems as though I had already made a journey in his cab which is usually made by rail The stations are crowded I am wondering whether to go to Krems or to Znaim but I reflect that the Court will be there and I decide in favour of Gra or some such place Now I am seated in the railway carriage which is rather like a tram and I have in my buttonhole a peculiar long braided thing on which are violet brown violets of stiff material which makes a great impression on people* Here the scene breaks off

I am once more in front of the railway station but I am in the company of an elderly gentleman I think out a scheme for remaining unrecogni ed but I see this plan already being carried out Thinking and experiencing are here as it were the same thing He pretends to be blind at least in one eye and I hold before him a male glass urinal (which we have to buy in the city or have bought) I am thus a sick nurse and have to give him the urinal because he is blind If the conductor sees us in this position he must pass us by without drawing attention to us At the same time the position of the elderly man and his urinating organ is plastically perceived Then I wake with a desire to urinate

The whole dream seems a sort of phantasy which takes the dreamer back to the year of revolution 1848 the memory of which had been revived by the jubilee of 1898 as well as by a little excursion to Wachau on which I visited *Emmersdorf* the refuge of the student leader Fischof to whom several features of the manifest dream content might refer The association of ideas then leads me to

Th s epet t o has pt I to th t t f the d m, app re tly th ough bse t m d d d I h l ft it because analys shows th t t h s a m g

Th r d t sl p f I I med I t th t th Emm sd f W b t d t cal w th th f g f th I tl t Fisch f place of th sam nam

England, to the house of my brother who used in jest to twit his wife with the title of — A wh reupon en at the

sight of Count Thun, is like the f çade of an Italian church, without organic connection with the structure behind it but unlike such a f çade t is full of gaps and confused, and in many places portions of the interior break through. The first situation of the dream is made up of number of cenes, into which I am able to d sect t. The arrogant attitude of the Count in the dream s cop ed from a scene at my school which occurred in my fifteenth year We had hatched c nspiracy gainst an unpopular and ignorant teache the leading spirit in this conspiracy was a schoolmate who since that time seems to ha e taken Henry VIII of England as his model. It fell to me to carry out the *coup d'é at* and a discus o of the im portance of the Danube (German, *Donau*) to Austria (Wachau) was the occa ion f an open revolt *One of our f llow-conspirators was our* only aristocratic hoolmate—he was called the giraffe on account f his consp cu us height—and while he w s being reprimanded by the tyrant of the chool th professor of the *German* language h tood just as the Count stood in the dream. The explanation f the *favourit* flow and the putting into a button

peare s historical play wh h opens the civil wars f the *Red* and th *White* Roses the men tion f Henry VIII has pa ed the way to this reminiscence Now t is n very far from roses to red and white carnat ons (Meanwhil two little rhymes the one German, the other Span sh, insinuat themsel es into the analys *Rosen Tulpen Nelken al Bl men welken* and *Isabel flores qu s marchitan las flores* The panish line occurs in *F garo*) Here in Vienna ite carnations ha e becom the badge of the *A ti-Sem t* red ones f the *S cial D m cra* Behind th s is the recollectio of an a Semitic challenge dur g a railw journey in beaut f l S xony (Anglo-Saxo) The third scene contributing to the form t on f the first situation in the dream d tes from my ea ly stu

dent days There was a debate in a *German* stu dents club about the relation of philosophy to th en ral sciences Being a green youth full of

dent, wh has ince then shown his capacity l leadin men and organizin the masses and who m reo e bears a name bel nging to the animal kingdom, rose and gave us a tho ough dres ing down he too he aid had herded swin in his youth, and had then returned repentant to his f the s house. *I jumped up* (as in the dream) became *piggishly rude* and retorted that since I knew he had herded *swine I was ot surprised* at the tone of his discourse (In the dream I am *surprised at* my German Nationalistic feel ings) There was a great commotion and an alm st general demand that I sh uld retract my words but *I stood my ground*. The insulted tudent was too sensible to take the advice which was off red him, that he should send me a *chal e ge* and let the matter drop

The remaining elements of this cene of the *dream are of more remote origin. What does t* mean that the Coun should make a scornful referen e to colt-foot? H re I must question my train of associations. Coltsfoot (German *Huflattich*) *Latt ce* (lettuce) *Salath d* (the dog that grudges oth rs what he cannot eat him self) Here plenty of opp obrious epithets may be discerned *Gir-affe* (German *Affe*=m key ape) *pig sow dog* I might even arri e by way f the name at *donkey* and thereby pour c tempt upo an academ c profes or Furthermore I translate coltsfoot (H flatt ch) —I d not know wh ther I do o correctly—by *pis -en-l t* I get this idea from Zola s *Germinal* in which some children are told to bring som dandelion salad w th them. The dog—*chien*—has a name sounding not unlike the verb for the major funct on (*chier* as *pisser* stands f the mino o e) Now w sh ll soon have the indecent in all ts three phys cal categories fo in th sam *Germ nal* which deal with the f ture revolution there is a description of a very peculiar contest, which relates to the production of the gaseous e cretions known as *flatus* And now I cannot but observe how the way t this *flatus* ha been prepared a l g while ince beginning with the *flowers* and proceeding t th Spanish th me of *Isabel a* to *Ferdinand* and *Is b lla* and by way of Henry VIII

Roses, tulips nd carna ions flowers all ll withe
Do not cry li tle Isabella because you flowers have faded.

N t i *Germinal* but *La Terre*—a mistak f which I becam ware only in the nalysis. Here I would call en ion to the iden y f le ters in *Huflattich* and *Flatus*

to English history at the time of the Armada after the victorious termination of which the English struck a medal with the inscription *Flavit et dissipati sunt* for the storm had scattered the Spanish fleet I had thou ht of using this phrase half jestingly as the title of a chapter on Therapy if I should ever succeed in giving a detailed account of my conception and treatment of hysteria

I cannot give so detailed an interpretation of the second scene of the dream out of sheer regard for the censorship For at this point I put myself in the place of a certain eminent gentleman of the revolutionary period who had an adventure with an eagle (German *Adler*) and who is said to have suffered from incontinence of the bowels *incontinentia alvi* etc and here I believe that I *should not be justified* in passin the censorship even though it was an *aulic* councillor (*aula consiliarius aulicus*) who told me the greater part of this history The suite of rooms in the dream is suggested by his Excellency s private saloon carriage into which I was able to glance but it means as it so often does in dreams a woman The personality of the housekeeper is an ungrateful allusion to a witty old lady which ill repays her for the good times and the many good stories which I have enjoyed in her house The incident of the lamp goes back to *Grillpar er* who notes a charming experience of a similar nature of which he afterwards made use in *Hero and Leander* (the *waves* of the *sea* and of love—the Armada and the *storm*)

I must forego a detailed analysis of the two remaining portions of the dream I shall single out only those elements which lead me back to the two scenes of my childhood for the sake of which alone I have selected the dream The reader will rightly assume that it is sexual material which necessitates the suppression but he may not be content with this explanation There are many things of which one makes no secret to oneself but which must be treated as secrets in addressing others and here we are concerned not with the reasons which induce me to conceal the solution but with the motive of the inner censorship which conceals the real content of the dream even from myself Concerning this I will confess that the analysis reveals these three portions of the dream as impertinent boasting the exuberance of an ab urd megalomania long ago suppressed in my waking life which however dares to show itself with individual ramifications even in the manifest dream content (*it seems to me that I am a cunning fellow*) making the high spirited mood of the evening before the dream perfectly intelligible Boasting of every kind indeed thus the mention of Graz points to the phrase What price Graz? which one is wont to use when one feels unusually wealthy Readers who recall Master Rabelais s inimitable description of the life and deeds of Gargantua and his son Pantagruel will be able to enroll even the suggested content of the first portion of the dream among the boasts to which I have alluded But the followin belongs to the two scenes of childhood of which I have spoken I had bought a *new* trunk for this journey the colour of which a *brownish violet* appears in the dream several times (violet brown violets of a stiff cloth

I have been childhood itself has been replaced by my recollection of the story I am told that at the age of two I still used occasionally to wet my bed and that when I was reproved for doing so I *consoled* my father by promising to buy him a beautiful *new red* bed in N (the nearest large town) Hence the interpolation in the dream that we *had bought the urinal in the city or had to buy it* one must keep one s promises (One should note moreover the association of the male urinal and the woman s trunk *box*) All the megalomania of the child is contained in this promise The significance of dreams of urinary difficulties in the case of children has already been considered in the interpretation of an earlier dream (cf the dream on p 208) The psycho analysis of neurotics has taught us to recognize the intimate connection between wetting the bed and the character trait of ambition

Then when I was seven or eight years of age another domestic incident occurred which I remember very well One evening before going to bed I had disregarded the dictates of discretion and had satisfied my needs in my parents bedroom and in their presence Reprimanding

A u l c ted b g ph r D F W tt l re p o ch me f ba g m tt d the m of J hovah

me for this d linquency my fathe rem rked "That boy will ever amount to anythin This must ha e been a terrible affront to my amb tion for allus s to th s sc ne recur again and again in my d eams and are constantly coupled with e umerations of my ac compli hments and succ sses as tho gh I wanted to say 'You see I ha e amounted to somethi g after all Th childi h ce e fur ni hes the lements for the last image of the dream in which the roles a int rchanged f course f r the purpose of rev ge The eld rly man obv ou ly my fath r for th blindness in o e eye signifies his one ded glaucoma is n w urinating before me as I once urinat d before him By means of the glaucoma I re mind my fath r f cocaine which stood him in good stead during his operation though I had thereby fulfill d my p omise Bes d s I make sport of him s c he is blind I m st h ld the *glass* i fr nt of him d I delight in allus ons t my knowled e of the theory of hysteria, f which I am p oud

If th two child sh scenes of urination are a c rding to my the ry closely a sociated with the d s re fo greatness their resuscitat on on the j urn y to the Aussee was further favoured by the accidental circumstance that my com partment had no lavatory and that I must be prepared to postpone relief during the journey as actually happened in the mornin when I woke w th the ensation of a bodily need I suppo e one might be i clined to credit this ensation with being th actual stimulus of the dream I should however prefe a differ nt explanat o namely that the dream thoughts first gave rise to the des r to urinate It s quite unusual for me to be d stu bed in sleep by ny phys cal need least of all at the time when I woke o this occas on—a quarter to four in the morning I w uld forestall a further objec tion by emarking that I ha e ha dly ever felt a des r to urinat after waking ea ly on other journeys made under more c mfortable ci cum stances However I can leave this po nt unde cided w thout weakening my argum nt.

Furthe since experience n dream-analysis has drawn my attention to the f ct that even from dreams the interpret tio of which seems at first ght complet because the dream sources and the wish stimuli are eas ly demon strable important trains f thought p ceed which reach back int th ea l est years of childh od I had to ask myself whether this characteristic does n t eve constitute an es s tial condit on of dreaming If t were pe missible to ge eralize this notion I hould say that every dream s connected through its mani fe t c nte t with rece t experie ces while through its latent conte t t is connected with the mo t remote experiences and I can actually how in the analysis of hysteria that these re mote experienc s have m a very real sense remained *ecent* right up to the present But I till find t very difficult to p ove this conjec ture I shall ha e t eturn to th prob ble le in dream f rm tion of th liest experi nces of ur childhood n an ther c nn t on (chapt II)

ory considered above one—the preference for the unimportant in the dream content—has been satisfactorily explained by tracing it back to dream distortion We have succeeded in establishing the existence of the other two peculiarities—the preferential election of recent and also of infantile material—but we have found it impossible to derive them from the motives of the dream Let us keep in mind these two characteristics which we still have to explain or evaluate a place will have to be found for them elsewhere either in the discussion of the psychology of the sleeping state or in the consideration of the structure of the psychic apparatus—which we shall undertake later after we have seen that by means of dream interpretation we are able to glance as through an inspection hole into the interior of this apparatus

But here and now I will emphasize another result of the last few dream analyses The dream often appears to have several meanings not only may several wish fulfilments be combined in it as our examples show but one meaning or one wish fulfilment may conceal another until in the lowest stratum one comes upon the fulfilment of a wish from the earliest period of childhood and here again it may be questioned whether the word *often* at the beginning of this sentence may not more correctly be replaced by *constantly*

C The Somatic Sources of Dreams

If we attempt to interest a cultured layman in the problems of dreams and if with this end in view we ask him what he believes to be the source of dreams we shall generally find that he feels quite sure he knows at least this part of the solution He thinks immediately of the influence exercised on the formation of dreams by a disturbed or impeded digestion (Dreams come from the stomach) an accidental position of the body a trifling occurrence during sleep He does not seem to suspect that even after all these factors have been duly considered something still remains to be explained

In the introductory chapter we examined at length the opinion of scientific writers on the role of somatic stimuli in the formation of dreams so that here we need only recall the results of this inquiry We have een that three kinds of somatic stimuli will be di tinguished the objective sensory stimuli which proceed from external objects the inner states of excitation of the ensory organs having only a subjective reality and the bodily stimuli arising within the body and we have also noticed that the writers on dreams are inclined to thrust into the background any psychic sources of dreams which may operate simultaneously with the somatic stimuli or to exclude them altogether In testing the claims made on behalf of these somatic stimuli we have learned that the significance of the objective excitation of the sensory organs—whether accidental stimuli operating during sleep or such as cannot be excluded from the dormant relation of these dream ima es and ideas to the internal bodily stimuli and confirmed by experiment that the part played by the subjective sensory stimuli appears to be demonstrated by the recurrence of hypna ogic sensory images in dreams and that although the broadly accepted relation of these dream images and ideas to the internal bodily stimuli cannot be exhaustively demonstrated it is at all events confirmed by the well known influence which an excited state of the digestive urinary and sexual organs exercises upon the content of our dreams

Nerve stimulus and *bodily stimulus* would thus be the anatomical sources of dreams that is according to many writers the sole and exclusive sources of dreams

But we have already considered a number of doubtful points which seem to question not so much the correctness of the somatic theory as its adequacy

However confident the representatives of this theory may be of its factual basis—e pecially in respect of the accidental and external nerve stimuli which may without d fficulty be recognized in the dream content—nevertheless they have all come near to admitting that the rich content of ideas found in dreams cannot be derived from the external nerve stimuli alone In this connection Miss Mary Whiton Calkins tested her own dreams and tho e of a second person for a period of six weeks and found that the element of external sensory perception was demonstrable in only 13 2 per cent and 6 7 per cent of these dreams respectively Only two dreams in the whole collection could be referred to organic sensations These statis

ties confirm what a cursory survey of our own experience would already have led us to suspect.

A distinction has often been made between *nerve stimulus dreams* which have already been thoroughly investigated and other forms of dreams Spitta, for example, divided dreams into nerve stimulus dreams and association dreams. But it was obvious that this solution remained unsatisfactory unless the link between the somatic sources of dreams and their ideational content could be indicated.

In addition to the first objection, that of the insufficient frequency of the external sources of stimulus, a second objection presents itself namely the inadequacy of the explanations of dreams afforded by this category of dream-sources. There are two things which the representatives of this theory have failed to explain firstly why the true nature of the external stimulus is not recognized in the dream, but is constantly mistaken for something else and secondly why the result of the reaction of the perceiving mind to this misconceived stimulus should be so indeterminate and variable We have seen that Strumpell, in answer to these questions asserts that the mind, since it turns away from the outer world during sleep is not in a position to give the correct interpretation of the objective sensory stimulus, but is forced to construct illusions on the basis of the indefinite stimulation arriving from many directions In his own words (*Die Natur und Entstehung der Traume* p 108)

When by an external or internal nerve-stimulus during sleep a feeling or a complex of feelings, or any sort of psychic process arises in the mind and is perceived by the mind, this process calls up from the mind perceptual images belonging to the sphere of the waking experiences that is to say earlier perceptions either unembellished, or with the psychic values appertaining to them. It collects about itself as it were a greater or lesser number of such images from which the impression resulting from the nerve-stimulus receives its psychic value. In this connection it is commonly said, as in ordinary language we say of the waking procedure that the mind *interprets* in sleep the impressions of nervous stimuli. The result of this interpretation is the so-called *nerve stimulus dream*—that is a dream the components of which are conditioned by the fact that a nerve-stimulus produces its psychical effect in the life of the mind in accordance with the laws of reproduction.

In all essential points identical with this doctrine is Wundt's statement that the concepts of dreams proceed, at all events for the most part from sensory stimuli and especially from the stimuli of general sensation and are therefore mostly phantastic illusions—probably only to a small extent pure memory-conceptions raised to the condition of hallucinations To illustrate the relation between dream-content and dream stimuli which follows from this theory Strumpell makes use of an excellent simile. It is as though the ten fingers of a person ignorant of music were to stray over the keyboard of an instrument. The implication is that the dream is not a psychic phenomenon, originating from psychic motives, but the result of a physiological stimulus, which expresses itself in psychic symptomatology because the apparatus affected by the stimulus is not capable of any other mode of expression. Upon a similar assumption is based the explanation of obsessions which Meynert attempted in his famous simile of the dial on which individual figures are most deeply embossed.

Popular though this theory of the somatic dream stimuli has become and seductive though it may seem, it is none the less easy to detect its weak point. Every somatic dream stimulus which provokes the psychic apparatus in sleep to interpretation by the formation of illusions may evoke an incalculable number of such attempts at interpretation It may consequently be represented in the dream-content by an extraordinary number of different concepts. But the theory of Strumpell and Wundt cannot point to any sort of motive which controls the relation between the external stimulus and the dream-concept chosen to interpret it and therefore it cannot explain the "peculiar choice which the stimuli often enough make in the course of their productive activity (Lipps, *Grundtatsachen des Seelenlebens* p 170) Other objections may be raised against the fundamental assumption behind the theory of illusions—the assumption that during sleep the mind is not in a condition to recognize the real nature of the objective sensory stimuli. The old physiologist Burdach shows us that the mind is quite capable even during sleep of a correct interpretation of the

I would advise everyone to read the exact and detailed records (collected in two volumes) of the dreams experimentally produced by Mourly Vold in order to convince himself how little the conditions of the experiments help to explain the content of the individual dream, and how little such experiments help us towards an understanding of the problems of dreams.

sensory impressions which reach it and of reacting in accordance with this correct interpretation inasmuch as he demonstrates that certain sensory impressions which seem important to the individual may be excepted from the general neglect of the sleeping mind (as in the example of nurse and child) and that one is more surely awakened by one s own name than by an indifferent auditory impression all of which presupposes of course that the mind discriminates between sensations even in sleep Burdach infers from these observations that we must not assume that the mind is incapable of interpreting sensory stimuli in the sleeping state but rather *that it is not sufficiently interested in them* The arguments which Burdach employed in 1830 reappear unchanged in the works of Lipps (in the year 1883) where they are employed for the purpose of attacking the theory of somatic stimuli According to these arguments the mind seems to be like the sleeper in the anecdote who on being asked Are you asleep? answers No and on being again addressed with the words Then lend me ten florins takes refuge in the excuse I am asleep

The inadequacy of the theory of somatic dream stimuli may be further demonstrated in another way Observation shows that external stimuli do not oblige me to dream even though these stimuli appear in the dream content as soon as I begin to dream—supposing that I do dream In response to a touch or pressure stimulus experienced while I am asleep a variety of reactions are at my disposal I may overlook it and find on waking that my leg has become uncovered or that I have been lying on an arm indeed pathology offers me a host of examples of powerfully exciting sensory and motor stimuli of different kinds which remain ineffective during sleep I may perceive the sensation during sleep and through my sleep as it were as constantly happens in the case of pain stimuli but without weaving the pain into the texture of a dream And thirdly I may wake up in response to the stimulus simply in order to avoid it Still another fourth reaction is possible namely that the nerve stimulus may cause me to dream but the other possible reactions occur quite as frequently as the reaction of dream formation This however would not be the case *if the incentive to dreaming did not lie outside the somatic dream sources*

Appreciating the importance of the above mentioned lacunae in the explanation of dreams by somatic stimuli other writers—Scherner for example and following him the philosopher Volkelt—endeavoured to determine more precisely the nature of the psychic activities which cause the many coloured ima es of our dreams to proceed from the somatic stimuli and in so doing they approached the problem of the essential nature of dreams as a problem of psychology and regarded dreaming as a psychic activity Scherner not only gave a poetical, vivid and glowing description of the psychic peculiarities which unfold themselves in the course of dream formation but he also believed that he had hit upon the principle of the method the mind employs in dealing with the stimuli which are offered to it The dream according to Scherner in the free activity of the phantasy which has been released from the shackles imposed upon it during the day *strives to represent* symbolically the nature of the organ from which the stimulus proceeds Thus there exists a sort of dream book a guide to the interpretation of dreams by means of which bodily sensations the conditions of the organs and states of stimulation may be inferred from the dream images Thus the image of a cat expressed *extreme ill temper the image of pale* smooth pastry the nudity of the body The human body as a whole is pictured by the phantasy of the dream as a house and the individual organs of the body as parts of the house In *toothache dreams* a vaulted vestibule corresponds to the mouth and a staircase to the descent from the pharynx to the oesophagus in the *headache dream* a ceiling covered with disgusting toad like spiders is chosen to denote the upper part of the head Many different *symbols are employed by our dreams for* the same organ thus the breathing *lung finds its* symbol in a roaring stove filled with flame. the heart in empty boxes and baskets and the bladder in round bag shaped or merely hollow objects It is of particular significance that at the close of the dream the stimulating organ or its function is often represented without disguise and usually on the dreamer s own body Thus the *toothache-dream* commonly end by the dreamer drawing a tooth out of his mouth

It cannot be said that this theory of dream interpretation has found much favour with other writers It seems above all extravagant and o Scherner s *readers have hesitated to give* it even the small amount of credit to which it is, in my opinion entitled As will be seen it tends to a revival of dream interpretation *by means* of *symbolism* a method employed by the ancients only the province from which the in

terpretation is to be derived is restricted to the human body. The lack of a scientifically comprehensible technique of interpretation must seriously limit the applicability of Scherner's theory. Arbitrariness in the interpretation of dreams would appear to be by no means excluded, especially since in this case also a stimulus may be expressed in the dream-content by several representative symbols; thus even Scherner's follower Volkelt was unable to confirm the representation of the body as a house. Another objection is that here again the dream activity is regarded as a useless and aimless activity of the mind, since, according to this theory, the mind is content with merely forming phantasies around the stimulus with which it is dealing, without even remotely attempting to abolish the stimulus.

Scherner's theory of the symbolization of bodily stimuli by the dream is seriously damaged by yet another objection. These bodily stimuli are present at all times, and it is generally assumed that the mind is more accessible to them during sleep than in the waking state. It is therefore impossible to understand why the mind does not dream continuously all night long, and why it does not dream every night about all the organs. If one attempts to evade this objection by positing the condition that special excitations must proceed from the eye, the ear, the teeth, the bowels, etc., in order to arouse the dream-activity, one is confronted with the difficulty of proving that this increase of stimulation is objective, and proof is possible only in a very few cases. If the dream of flying is a symbolization of the upward and downward motion of the pulmonary lobes, either this dream, as has already been remarked by Strumpell, should be dreamt much oftener, or it should be possible to show that respiration is more active during this dream. Yet a third alternative is possible—and it is the most probable of all—namely, that now and again special motives are operative to direct the attention to the visceral sensations which are constantly present. But this would take us far beyond the scope of Scherner's theory.

The value of Scherner's and Volkelt's disquisitions resides in their calling our attention to a number of characteristics of the dream-content which are in need of explanation, and which seem to promise fresh discoveries. It is quite true that symbolizations of the bodily organs and functions do occur in dreams: for example, that water in a dream often signifies desire to urinate, that the male genital organ may be represented by an upright staff or a pillar, etc. With dreams which exhibit a very animated field of vision and brilliant colours, in contrast to the dimness of other dreams, the interpretation that they are "dreams due to visual stimulation" can hardly be dismissed, nor can we dispute the participation of illusion-formation in dreams which contain noise and a medley of voices. A dream like that of Scherner, that two rows of fair handsome boys stood facing one another on a bridge, attacking one another, and then resuming their positions, until finally the dreamer himself sat down on a bridge and drew a long tooth from his jaw; or a similar dream of Volkelt's, in which two rows of drawers played a part, and which again ended in the extraction of a tooth: dream

seeking the kernel of truth which may be contained in it. We are therefore confronted with the task of finding a different explanation of the supposed symbolization of the alleged dental stimulus.

Throughout our consideration of the theory of the somatic sources of dreams I have refrained from urging the argument which arises from our analyses of dreams. If, by a procedure which has not been followed by other writers in their investigation of dreams, we can prove that the dream possesses intrinsic value as psychic action, that a wish supplies the motive of its formation, and that the experiences of the previous day furnish the most obvious material of its content, any other theory of dreams which neglects such an important method of investigation—and accordingly makes the dream

which only one kind has come under our observation, while the other kind alone has been observed by the earlier investigators. It only remains now to find a place in our theory of dreams for the facts on which the current doctrine of somatic dream-stimuli is based.

We have already taken the first step in this direction in advancing the thesis that the dream-work is under a compulsion to elaborate into a unified whole all the dream-stimuli which are simultaneously present (p. x above). We have seen that when two or more experiences capable of making an impression on the mind have

been left over from the previous day the wishes that result from them are united into one dream similarly that the impressions possessing psychic value and the indifferent experiences of the previous day unite in the *dream material provided that connecting ideas* between the two can be established Thus the dream appears to be a reaction to everything which is simultaneously present as actual in the sleeping mind As far as we have hitherto analysed the dream material we have discovered it to be a collection of psychic remnants and memory traces which we were obliged to credit (on account of the preference shown for re*cent and for infantile material*) with a character of psychological actuality though the nature of this actuality was not at the time determinable We shall now have little difficulty in predicting what will happen when to these actualities of the memory fresh material in the form of sensations is added during sleep These stimuli again are of importance to the dream because they are actual they are united with the other psychic actualities to provide the material for dream formation To express it *in other words the stimuli which occur dur*ing sleep are elaborated into a wish fulfilment of which the other components are the psychic remnants of daily experience with which we are already familiar This combination however is not inevitable we have seen that more than one kind of behaviour toward the physical stimuli received during sleep is possible Where this combination is effected a conceptual material for the dream content has been found which will represent both kinds of dream sources the somatic as well as the psychic

The nature of the dream is not altered when *omatic material is* added to the psychic dream sources it still remains a wish fulfilment no matter how *its expression is determined* by the actual material available

I should like to find room here for a number of peculiarities which are able to modify the significance of external stimuli for the dream I imagine that a co operation of individual physiological and accidental factors which depend on the circumstances of the moment determines how one will behave in individual cases of more intensive objective stimulation during sleep habitual or accidental profundity of sleep in conjunction with the intensity of the stimulus will in one case make it possible so to suppress the stimulus that it will not disturb the sleeper while in another case it will force the sleeper to wake or will assist the attempt to subdue the stimulus by weav... it into the texture of the dream In accordance with the multiplicity of these constellatio..., external objective stimuli will be expressed more rarely or more frequently in the case of one person than in that of another In my own case since I am an excellent sleeper and obstinately refuse to allow myself to be disturbed during sleep on any pretext whatever this in

deed I have noted only a single dream in which an objective painful source of stimulation is *demonstrable* and it will be highly instructive to see what effect the external stimulus had in this particular dream

I am riding a gray horse at first timidly and awkwardly as though I were merely carried along Then I meet a colleague P also on horseback and dressed in rough frie e he is sitting erect in the saddle he calls my a ten tion to something (probably to the fact that I have a very bad seat) Now I begin to feel more and more at ease on the back of my highly intelligent horse I sit more comfort bly

horse I ride between two vans and just man age to clear them After riding up the street for some distance I turn round and wish to dis mount at first in front of a little open chapel which is built facing on to the street Then I do really dismount in front of a chapel wh ch stands near the first one the hotel is in the same street I might let the horse go there by itself but I prefer to lead it thither It seems as though I should be ashamed to arrive there on horseback In front of the hotel there stands a page boy who shows me a note of mine which has been found and ridicules me on account of it On the note is written doubly underlined Eat nothing and then a second sentence (indistinct) something like Do not work at the same time a ha y idea that I am in a strange city in which I do no work

It will not at once be apparent that this dream originated under the influence or rather under the compulsion of a pain stimulus The day before however I had suffered from boils which made every movement a torture and at last a boil had grown to the size of an apple at the root of the scrotum and had caused me the most intolerable pains at every step a fev erish lassitude lack of appetite and the hard

work which I had nevertheless done during the day had conspired with the pain t upset me. I was not alt gether in a condition to discharge my duties as a physician b t in v ew of the na ture and the l cat o f the malady t was pos s'ble to im gine something else for which I was most of all unfit namely riding Now it s this very activity of riding into which I am plunged by the dream it is the most e erget c denial of the pain which imagination could conce ve As a matter of f ct I cannot ride I do not dream of doing so I never sat on a horse but once—and then without a saddle—and I d d not l'ke t But in this dream I ride as though I had o bo'l on the perineum o rather *I r de just b cause I wa t to have one* To judge from the d cripti n my saddle s th poultice wh ch has enabled me to f ll asleep Probably be g thus comforted I did not feel anything f my pain du ing the first few hours of my sleep Then the painful sensati s made them selves felt, and tried to wake me whe eupon th dream came and s d to me soothingly Go on sleep ng you are ot go ng to wake! Y u h e o boil for you are ding on ho se-back and w th a bo l just th re no one could ride! And the dream was s cc ssf l the pain was stifled, nd I went o sleeping

B t the dream was n t satisfied with sug gesting way the boil by tenaci usly holding fa t to an d a compat bl w th the malady (th s beh g like the hall cinatory insanity of a mother who ha lo t her child or f a me cha t who has lost his f rtune) In addi t o the details f the se sation denied and of ... n th d eam

of the h rse xactly orrespo ds w th th *pep-per-and salt* suit in whi h I last saw my col league P in the country I ha e been w rned that highly seas ned food th ca se of boils and in any case it is preferabl as an aetiolog ical explanat on t *s gar* which m ght be thought of n c nn tio w th furunculosis My f d P likes t *rid th h gh horse* with me ever nce he took my place the treatm t of a female patient whose case I had per f rm d great feats (*Kunstst cke* in th d am I sit the h rse at first s deways lik a tri k rid er *Kunst cuer*) but wh really lik th horse in the story of the Sunday eq estrian, led me wherever she wi hed. hou e in which I preceded my frie d i a phy cian a d to the plac where th bo l is located

I a oth r dream, I was similarly successful in warding off a threat ned disturba ce of my sleep thi time the threat came fr m a sensory stimul s It was only chan e however that en bled me to d scover the co n ction betwee the d eam and the accide tal dream stimulus and in this way to unde st nd the d eam One mids mme morn ng n a Tyrolese mounta n res rt I woke w th th kn wledge that I had dreamed *The Pope is dead* I was not able to interpret this ho t no visual dream. I could remember only o e poss ble bas s of the dre m n mely that shortly bef e th s th ...

n w I und rstood my dream It w the reac tio of my need for sleep to the n ise by which the p ous Tyroleans we e tryi g to w ke me I avenged myself on them by the co clusion

been left over from the previous day the wishes that result from them are united into one dream similarly that the impressions possessing psychic value and the indifferent experiences of the previous day unite in the dream material provided that connecting ideas between the two can be established Thus the dream appears to be a reaction to everything which is simultaneously present as actual in the sleeping mind As far as we have hitherto analysed the dream material we have discovered it to be a collection of psychic remnants and memory traces which we were obliged to credit (on account of the preference shown for recent and for infantile material) with a character of psychological actuality though the nature of this actuality was not at the time determinable We shall now have little difficulty in predicting what will happen when to these actualities of the memory fresh material in the form of sensations is added during sleep These stimuli again are of importance to the dream because they are actual they are united with the other psychic actualities to provide the material for dream formation To express it in other words the stimuli which occur during sleep are elaborated into a wish fulfilment of which the other components are the psychic remnants of daily experience with which we are already familiar This combination however is not inevitable we have seen that more than one kind of behaviour toward the physical stimuli received during sleep is possible Where this combination is effected a conceptual material for the dream content has been found which will represent both kinds of dream sources the somatic as well as the psychic

The nature of the dream is not altered when omatic material is added to the psychic dream sources it still remains a wish fulfilment no matter how its expression is determined by the actual material available

I should like to find room here for a number of peculiarities which are able to modify the significance of external stimuli for the dream I imagine that a co operation of individual physiological and accidental factors which depend on the circumstances of the moment determines how one will behave in individual cases of more intensive objective stimulation during sleep habitual or accidental profundity of sleep in conjunction with the intensity of the stimulus will in one case make it possible so to suppress the stimulus that it will not disturb the sleeper while in another case it will force the sleeper to wake or will assist the attempt to subdue the stimulus by weaving it into the texture of the dream In accordance with the multiplicity of these constellations external objective stimuli will be expressed more rarely or more frequently in the case of one person than in that of another In my own case since I am an excellent sleeper and obstinately refuse to allow myself to be disturbed during sleep on any pretext whatever this intrusion of external causes of excitation into my dreams is very rare whereas psychic motives apparently cause me to dream very easily Indeed I have noted only a single dream in which an objective painful source of stimulation is demonstrable and it will be highly instructive to see what effect the external stimulus had in this particular dream

I am riding a gray horse at first timidly and awkwardly as though I were merely carried along Then I meet a colleague P also on horseback and dressed in rough frieze he is sitting erect in the saddle he calls my attention to something (probably to the fact that I have a very bad seat) Now I begin to feel more and more at ease on the back of my highly intelligent horse I sit more comfortably horse I ride between two vans and just manage to clear them After riding up the street for some distance I turn round and wish to dismount at first in front of a little open chapel which is built facing on to the street Then I do really dismount in front of a chapel which stands near the first one the hotel is in the same street I might let the horse go there by itself but I prefer to lead it thither It seems as though I should be ashamed to arrive there on horseback In front of the hotel there stands a page boy who shows me a note of mine which has been found and ridicules me on account of it On the note is written doubly underlined Eat nothing and then a second sentence (indistinct) something like Do not work at the same time a hazy idea that I am in a strange city in which I do no work

It will not at once be apparent that this dream originated under the influence or rather under the compulsion of a pain stimulus The day before however I had suffered from boils which made every movement a torture and at last a boil had grown to the size of an apple at the root of the scrotum and had caused me the most intolerable pains at every step a feverish lassitude lack of appetite and the hard

work which I had nevertheless done during the day had conspired with the pain t upset me w t altogether in a condition to discharge — he na is pos- I was is this most ery acti ty of riding into whi h I am plunged by the dream it is the mo t e erg t c denial of the pain which maginati n c uld co ce ve. As a matte of fact I cannot ride I do not dream of d ing so I never at n a horse but on e—and th n witho t saddle—and I d d not like it. But in this dream I ride as though I had no boil o the perineum or rather *I ride just bec use I w t to have one* To judge from the description my saddle is the poultice wh ch has enabled m to fall asleep Probably being thus c mforted I did not feel anything of my pain durin the first few hours of my sleep Then the painful sensati ns made them selves felt, and tried to wake m whereupon th dream came and said to me soothingly Go o sleeping yo re not going to wake! Y u ha e o boil, for y u a e ding on horse-back and w th a boil just there o one c uld ride And th dream was suc essful the pain was stifled, and I went o sleeping

But the dream was n t satisfied with su gesting way" th boil by tenac usly holding f t to an de incompatible with the malady (th s beha ing like the hallucinatory insanity f a m ther who has lo t h child or of a m chant wh has lost his f rtune) In addi ti the d tails of the e satio denied and of th image used t suppress it serve th dream also as means to onn ct the material ac tually present in th mind with the s tu tion in

few well wishers among the of the city recently said to me with reference to the same hous hold And it was a *feat* to practise psychotherapy for eight to ten hours a day while suffering such pain but I know that I ca not continue my peculia ly strenu w k f r any length of time w thout perfect

ot wo k do ot eat On further interpreta I see that the dream acti t has succeeded in finding its way from the wish tuat on of r d ing to some very ea ly childish quarrels which must have occurred betwee myself and a neph ew who is a ye r older tha I a d is now liv in in England It h also taken up eleme ts from my journeys in Italy the street in the dream is built up out of impres ons of Verona and S ena. A still deeper interpretation leads to sexual dream thoughts and I recall what the dream llus ons to that beautiful country were supposed t mean in the dream of a female patient wh had never been to Italy (*to Italy* German *gen Italien=Genital en=genitals*) at the same time there are references to the h use in which I preceded my friend P as phys cian and to the pl ce where the boil s located.

In another d eam, I was s mila ly successful in warding off a threat ned dist bance of my sleep this tim the thr at came from a sensory

thought of in c nn tion with furunculos s My friend P likes t *ride the h gh horse* with me ever s he took my plac in the treatment of a female patient in whos case I had per form d great feats (*Kun t t ke* in th dream I sat the h rs t first deways lik trick rid er *Kunstr ter*) but wh really lik th h rse in the st ry of the Sunday eq tria led m wherever sh wished Thus the horse c mes to be a symb lic represe tati of lady pa

midsummer morning in a Tyrolese m untain re rt I woke w th the knowledge that I had d eamed *The Pope is dead* I was not able to interpret this short, non visual d eam. I could rem mbe only e poss bl basis of the dream namely that shortly before this the ewspapers had reported that His Holiness was lightly dispo ed. B t in the c urse of the m rning my w fe ask d me D d you hea th dreadful tolling f the church bells this morn in ? I had no idea that I had he rd t but now I und rstood my dream It was th eac t n of my need fo sleep t th noise by which th p ous Tyroleans we e trying t wake m I a enged myself on them by the conclus on

been left over from the previous day the wishes that result from them are united into *one dream* similarly that the impressions possessing psychic value and the indifferent experiences of the previous day unite in the dream material provided that connecting ideas between the two can be established Thus the dream appears to be a reaction to everything which is simultaneously present as actual in the sleeping mind As far as we have hitherto analysed the dream material we have discovered it to be a collection of psychic remnants and memory traces which we were obliged to credit (on account of the preference shown for recent and for infantile material) with a character of psychological actuality though the nature of this actuality was not at the time determinable We shall now have little difficulty in predicting what will happen when to these actualities of the memory fresh material in the form of sensations is added during sleep These stimuli again are of importance to the dream because they are actual they are united with the other psychic actualities to provide *the material for dream formation* To express it in other words the stimuli which occur during sleep are elaborated into a wish fulfilment of which the other components are the psychic remnants of daily experience with which we are already familiar This combination however is not inevitable we have seen that more than one kind of behaviour toward the physical stimuli received during sleep is possible Where this combination is effected a conceptual material for the dream content has been found which will represent both kinds of dream sources the somatic as well as the psychic

The nature of the dream is not altered when *somatic material* is added to the psychic dream sources it still remains a wish fulfilment no matter how its expression is determined by the actual material available

I should like to find room here for a number of peculiarities which are able to modify the significance of *external stimuli* for the dream I imagine that a co operation of individual physiological and accidental factors which depend on the circumstances of the moment determines how one will behave in individual cases of more intensive objective stimulation during sleep habitual or accidental profundity of sleep in conjunction with the intensity of the stimulus will in one case make it possible so to suppress the stimulus that it will not disturb the sleeper while in another case it will force the sleeper to wake or will assist the attempt to subdue the stimulus by weaving it into the texture of the dream In accordance with the multiplicity of these constellations external objective stimuli will be expressed more rarely or more frequently in the case of one person than in that of another In my own case since I am an excellent sleeper and obstinately refuse to allow myself to be disturbed during sleep on any pretext whatever this intrusion of external causes of excitation into my dreams is very rare whereas psychic motives apparently cause me to dream very easily Indeed I have noted only a single dream in which an objective painful source of stimulation is demonstrable and it will be highly instructive to see what effect the external stimulus had in this particular dream

I am riding a gray horse at first timidly and awkwardly as though I were merely carried along Then I meet a colleague P also on horseback and dressed in rough frieze he is sitting erect in the saddle he calls my attention to something (probably to the fact that I have a very bad seat) Now I begin to feel more and more at ease on the back of my highly intelligent horse I sit more comfortably and I find that I am quite at home up here My saddle is a sort of pad which completely fills the space between the neck and the rump of the horse I ride between two vans and just manage to clear them After riding up the street for some distance I turn round and wish to dismount at first in front of a little open chapel which is built facing on to the street Then I do really dismount in front of a chapel which stands near the first one the hotel is in the same street I might let the horse go there by itself but I prefer to lead it thither It seems as though I should be ashamed to arrive there on horseback In front of the hotel there stands a page boy who shows me a note of mine which has been found and ridicules me on account of it On the note is written doubly underlined Eat nothing and then a second sentence (indistinct) something like Do not work at the same time a hazy idea that I am in a strange city in which I do no work

It will not at once be apparent that this dream originated under the influence or rather under the compulsion of a pain stimulus The day before however I had suffered from boils which made every movement a torture and at last a boil had grown to the size of an apple at the root of the scrotum and had caused me the most intolerable pains at every step a feverish lassitude lack of appetite and the hard

is at an end From among the interpretations of the stim lus which are thus admissible that one is selected which can secure the best con nection with the wi h impul es that ar ly n in wait in the mind Th s everything d finite ly determined, and nothin is left to caprice Th misin rpret tio is not an illusion but—if you will—an excu e Here again as in substitu tio by di plac ment in the serv ce f the dream-cen orship we have an act of deflection of the ormal psy hic procedure

If the external nerve timuli and the inner bodily timuli are suffici tly ntense to com pel psychic ttentı n th y represent—that s if they result in dreaming at all, and not in waking—a fixed po t for dream f rmation a ucleus in the dream mat rial, f r which an appropriate wish fulfilment s ought ju t as (see above) mediating ideas between two psy chical dream-stimul are sought To this ex t nt t is tru of a n mbe of dreams that the somatic eleme t di tates the dream-conte t. In this extreme case even wish that i not actually present may be roused f r the pur pos of dream f rmation. But the dream can — repre ent a wish in me

whi h seems a ontradict b t be omes pe f ctly int lligibl f w take into account th presence of two s rts of psy hic in tance a d th ens rship that s b sts between th m

I the psychi life there exist w ha e seen *epr* d wi hes wh h bel g t th first sy t m and t wh se fulfilme t the se o d sys tem opposed We d t mean this his- t ric sense—th t such w shes ha ce exi ted and ha e bseque tly bee destroyed Th d trin f *pr ssion* whi h we eed in th tudy of psy h eurose asserts that ch repressed wishes till exist but simulta eou ly w th an in hib ti whi h w ghs th m d wn. La gua has hit po th truth when t speaks of th *sup- pr on* (sub-pres pu h g under) f h mpulses Th psychi m hani m wh ch enables su h upp essed wishes t f c th way t re lization is r tained in being and in w king rder B t f t happens that ch a suppressed w sh is fulfill d, th anqui hed in hib ti f the se ond sys em (which i ca pable of consciousness) is then expressed as discomfort. And in order to conclude this argument If sensat o s of a disagreeable character which originate from somatic sources are present during sleep this constellation is utilized by the dream activity to procure the fulfilment—w th more or less ma ntenance of the censorsh p—of an otherw se suppressed wi h.

This state of affairs makes poss'ble a certain number of anxiety-dreams while others of these dream formations which are unfavourable to the wi h theory exhibit a diff rent mechan sm For the anxiety in dreams may of course be of a p ychoneurotic character originat n i psy cho sexual excitation, in which case the anx i ty correspo ds to repres ed l bido Then this anxiety like the whole anxiety-dream has the s gnificance of a neurotic ympt m a d we tand at the di ding line wh re the wi h ful filling tende cy of dreams is frustrated. But in othe anx ety-dre ms the feeling of anxiety c mes from somatic sources (as n the case of pers ns suffering from pulmonary or cardiac tr uble w th occa onal d fficulty in breath ng) and then it is used to help such strongly sup- pressed wishes to attain fulfilment in a dream the dre ming f wh h from psych c moti es would have re ulted i th same rele se of anx ety It s not difficult t reco cile these two ppar tly co trad ctory cases Wh two psy chic f rmatio an affect e incl nat on and a conceptual c nte t re intimately c nnected e ther o e be g ctu lly prese t will evoke the other even in a dream now the anxiety of so- mat c origin evok the suppre ed conceptual onte t ow it is the relea ed conceptual on tent, cc mpanied by exual excitement which causes the release f anxiety In th o e case t may be said that a somatically d termined affect psy hically interpreted n th other case ll s of psychic origin but the content whi h has been s ppressed is s ly replaced by a somatic t rpret t on wh h fits the anx i ty Th difficult es which lie in the way of under ta di g all thi have little to d with dream they are d to the f ct that in dis- cus g th se po ts we are to ching upon the problems of the devel pme t of anxiety nd of ep es on.

Th gen ral aggregate of bod'ly se sat n must undoubt dly be in luded amo g th domi nant d eam-stimuli f int rn l bod ly rigin Not that t is capabl of supplying the dream c nte t b t t fo ces th dream tho hts to make a cho e from the materi l destined to

which formed the content of my dream and continued to sleep without any further interest in the tolling of the bells

Among the dreams mentioned in the previous chapters there are several which might serve as examples of the elaboration of so called nerve stimuli The dream of drinking in long draughts is such an example here the somatic stimulus seems to be the sole source of the *dream and the wish arising from the sensation* —thirst—the only motive for dreaming We find much the same thing in other simple dreams where the somatic stimulus is able of itself to generate a wish The dream of the sick woman who throws the cooling apparatus from her cheek at night is an instance of an unusual *manner of reacting to a pain stimulus with a* wish fulfilment it seems as though the patient had temporarily succeeded in making herself analgesic and accompanied this by ascribing her pains to a stranger

My dream of the three Parcae is obviously a hunger dream but it has contrived to shift the *need for food right back to the child s longing* for its mother s breast and to use a harmless desire as a mask for a more serious one that cannot venture to express itself so openly In the dream of Count Thun we were able to see by what paths an accidental physical need was brought into relation with the strongest but *also the most rigorously repressed impulses* of the psychic life And when as in the case reported by Garnier the First Consul incorporates the sound of an exploding infernal machine into a dream of battle before it causes him to wake the true purpose for which alone [illegible]

behaves just as the great Napoleon did He dreams of a certain G Reich in *Hussiatyn* [illegible]

attention still further he is obliged to wake only to hear his wife—who is suffering from bronchial catarrh—violently coughing

Let us compare the dream of Napoleon I—who incidentally was an excellent sleeper—with that of the sleepy student who was awakened by his landlady with the reminder that he had to go to the hospital and who thereupon dreamt himself into a bed in the hospital and then slept on the underlying reasoning being as follows If I am already in the hospital I needn t get up to go there This is obviously a convenience dream the sleeper frankly admits *to himself his motive in dreaming but he* thereby reveals one of the secrets of dreaming in general In a certain sense all dreams are *convenience dreams* they serve the purpose of continuing to sleep instead of waking *The dream is the guardian of sleep not its disturber* In another place we shall have occasion to justify this conception in respect to the psychic factors that make for waking but we can already demonstrate its applicability to the objective external stimuli Either the mind does not concern itself at all with the causes of sensations during sleep if it is able to carry this attitude through as against the intensity of the *stimuli* and their significance *of which it is* well aware or it employs the dream to deny these stimuli or thirdly if it is obliged to recognize the stimuli it seeks that interpretation of them which will represent the actual sensation as a component of a desired situation which is compatible with sleep The actual sen*sation is woven into the dream in order to deprive it of its reality* Napoleon is permitted to go on sleeping it is only a dream memory of the thunder of the guns at Arcole which is trying to disturb him

The wish to sleep to which the conscious ego has adjusted itself and which (together with the dream censorship and the secondary elaboration to be mentioned later) represents the ego s contribution to the dream must thus always be taken into account as a motive of dream formation and every successful dream is a fulfilment of this wish The relation of this general constantly present and unvarying sleep-wish to the other wishes of which now one and now another is fulfilled by the dream content will be the subject of later consideration In the wish to sleep we have discovered a motive capable of supplying the deficiency in the theory of Strumpell and Wundt and of explaining the perversity and capriciousness of the interpretation of the external stimulus The correct interpretation of which the sleeping mind is perfectly capable would involve active interest and would require the sleeper to wake hence of those interpretations which are possible at all only such are admitted as are acceptable to the dictatorial censorship of the sleep wish The logic of dream situations would run *for example* *It is the nightingale* and not the lark For if it is the lark love s night

Th tw [illegible] f m wh h I k w of this dream d n t [illegible] ly g ee [illegible] t its t t

I curmudgeonly person, but as I willingly ad mit a woman of cleanly instincts, takes a dif ferent ew f the m tter She lies in wait for me to see wh ther I shall take the l'bert re- ferred t a.d, if he sees that I do I can dis tinctly hear h r growl For da s thereafter when we meet he refuses to greet m with the cust mary signs f respect. On the da before the dream the h usekeeper s attitude was rein forced by that of the maid. I had just finished my usual h rried n t t th pat ent when the servant confronted me in the ante-room ob- servin, "You m ght as well ha e wiped our shoes today doctor before you cam into the room. The red carpet is all dirty again from your feet. This is the only justificatio for the appearance of the tairs and the maid in my dream.

Between my leaping upsta rs and my spitting on the stairs there is an intim te connection. Pharyngitis and cardiac tro bles are both supposed to be punishments for the ce f smoking account of which ne m own housekeepe does not credit me with e cessive tidiness that my reputation suffers in both the houses which my dream fuses into o e

I must postpon th further interpretation f this dream until I can indicate th origin of the typ cal dream of being incompletely clothed In the meantime as a prov sional deduction from the dream just rel ted I not that the dream-sensati of inhib ted movement s al ways aroused at a point wh re a certain co nection requires it. A peculia c diti of my motor system during sleep cannot be respo sible f this dream-co tent, sinc a m ment earlier I found myself as though in nfirma tion f this f ct, hopping lighty up th tairs.

D Typical D eams

Generally speaking we are ot in po tion to interpret an the pers s dream if h is un willing t f rnish us with th unc nsci s thoughts which lie behind the dream-content and f this reason the pra tical pplicab'lity f our method f dream int rpretation i ften seriously restricted. But there re dreams whi h xhib t mplete contra t t the in div dual customary liberty to e dow his dream w ld with special indi duality the e-

The ts emen tha ou method f dream-interpre ta on is inappl cabl hen we have no our disposal the dreame a soci on-material m be qua. ed. In one case ou wo k f erpreta ion is indepe den f these associatio named when the dreamer makes use f ymbolic elements his dream. W then em- loy w a is, rictl speak ng, second auxiliary method of dream-in erpretation. (See below)

by making it macces ble to an alien under tand g there are a number of dreams which almost e ery one has dreamed in the same mann r and of wh ch we are accustomed to assume that they ha e the same gnifica ce in the case of every dreamer A peculiar inter est attaches to these typical dreams because no matter who dreams them they presumably all deri e from the same sources so that they would seem to be particula ly fitted to p ovide us with informat on as to the sources of dreams.

With qu te pecial expectations therefore we shall proceed to test ur technique of dream interpretat on on these t pical dreams and only with extreme relucta ce shall we admit that precisely in respect of this material our meth od is not fully erified. In the interpretation of typical dreams we as a rule fa l to bta those associations from the dreamer wh ch in other cases ha e led us to comprehen i n of the dream or else these assoc ations are co fused and inadequate so that they do not help us to sol e our problem

Why th s is the case and how we can remedy this defect in our technique are po s which will be di cu ed in a later chapte The reader will then und rsta d why I can deal with o ly a few of the group of typ cal dreams in this chapter and why I have postponed the di cus- s on of the others

( ) THE EMBARRASSME T DREAM OF NAKED ESS

I a dream in which one is naked or scantily clad in the presence of stran ers t sometimes happens that o e is ot in the lea t a hamed of e s c dit o B t the dream of nakedness demands our ttention only when shame and when wi hes

ter the painful sit tion. It is o ly n this con necti that the dream s typ cal therwise the n leus of ts conte t may be in ol ed in all orts of the c nect on or may be re pla ed b indi dual amplifications. The essen tial point that one ha a pai ful feeling of shame and is anxious t hide o naked ess usually by means of loc m ti but is abso- lutely unable t d o I bel eve that the great ma) rity of my re d rs will t some tim ha found th mselves in this tuation in a dream

The n ture and mann r of the expo ure is usually rathe ague The dreamer will say pe haps, I was in my chemi e but this is

serve the purpose of representation in the dream content inasmuch as it brings within easy reach that part of the material which is adapted to its own character and holds the rest at a distance Moreover this general feeling which survives from the preceding day is of course connected with the psychic residues that are significant for the dream Moreover this feeling itself may be either maintained or over come in the dream so that it may if it is pain ful veer round into its opposite

If the somatic sources of excitation during sleep—that is the sensations of sleep—are not of unusual intensity the part which they play in dream formation is in my judgment sim ilar to that of those impressions of the day which are still recent but of no great signifi cance I mean that they are utilized for the dream formation if they are of such a kind that they can be united with the conceptual content of the psychic dream source but not otherwise They are treated as a cheap ever ready material which can be used whenever it is needed and not as valuable material which itself prescribes the manner in which it must be utilized I might suggest the analogy of a connoisseur giving an artist a rare stone a piece of onyx for example in order that it may be fashioned into a work of art Here the size of the stone its colour and its markings help to decide what head or what scene shall be rep re ented while if he is dealing with a uniform and abundant material such as marble or sand stone the artist is guided only by the idea which takes shape in his mind Only in this way it seems to me can we explain the fact that the dream content furnished by physical stimuli of somatic origin which are not unusu ally accentuated does not make its appearance in all dreams and every night

Perhaps an example which takes us back to the interpretation of dreams will best illustrate my meaning One day I was trying to under stand the significance of the sensation of being inhibited of not being able to move from the spot of not being able to get something done etc which occurs so frequently in dreams and is so closely allied to anxiety That night I had the following dream *I am very incompletely dressed and I go from a flat on the ground floor up a flight of sta rs to an upper story In doing this I jump up three stairs at a time a d I am glad to find that I can mount the st rs so quickly Suddenly I notice that a servant maid is coming do n the stairs—that is to-wards me I am ashamed and try to hurry away and now comes this feeling of being in hibited I am glued to the stairs and cannot move from the spot*

Analysis The situation of the dream is taken from an every day reality In a house in Vienna I have two apartments which are connected only by the main staircase My consultation rooms and my tudy are on the raised ground floor and my living rooms are on the first floor Late at night when I have finished my work downstairs I go upstairs to my bedroom On the evening before the dream I had actually gone this short distance with my garments in disarray—that is I had taken off my collar tie and cuffs but in the dream this had changed into a more advanced but as usual indefinite degree of undress It is a habit of mine to run up two or three steps at a time moreover there was a wish fulfilment recognized even in the dream for the ease with which I run up-stairs reassures me as to the condition of my heart Further the manner in which I run up-stairs is an effective contrast to the sensation of being inhibited which occurs in the second half of the dream It shows me—what needed no proof—that dreams have no difficulty in representing motor actions fully and completely carried out think for example of flying in dreams!

But the stairs up which I go are not those of my own house at first I do not recognize them only the person coming towards me informs me of their whereabouts This woman is the maid of an old lady whom I visit twice daily in order to give her hypodermic injections the stairs too are precisely similar to those which I have to climb twice a day in this old lady s house

How do these stairs and this woman get into my dream? The shame of not being fully dressed is undoubtedly of a sexual character the servant of whom I dream is older than I surly and by no means attractive These ques tions remind me of the following incident When I pay my morning visit at this house I am usually seized with a desire to clear my throat the sputum falls on the stairs There is no spittoon on either of the two floors and I consider that the stairs should be kept clean not at my expense but rather by the provision of a spittoon The housekeeper another elder

nothing but the mass-phantasy of the child hood of the indiv dual. This is why in paradise me are naked and unashamed, until the moment arrives when shame and fear waken ex ment arrives when shame and fear waken ex pulsion follows and sexual life and cultural development begin. Into this paradise dreams can take us back every night we have alread en tured the conjecture that the impressions of our earliest childhood (from the prehistoric period until about the end of the third year) crave reproduction fo their own sake per haps without further ref rence to the r con tent so that their repetition is a wi h fulfilment. Dreams of nakedness, then, are *e h b on dreams*

The nucleus of an exhib tio -dream is fur nished by o e s own person, which is seen not as that f a child b t as t exi ts in the present and by the idea of canty clothing which emerges indi tinctly ow g to the superimposition of so many la e tuations of being par tially clothed, o ut of on d ration for the censorship to these elements are added the persons in whose presence on is ashamed. I know of n xample in whi h th actual spectators f these infantile exhib tions reappea in a dream f r a dream is hardl ever a im ple rec llection. Strangely en ugh, those per sons who re the objects of our sexual in erest in childhood are mitted from all reproduc t ns in dreams in hysteria or in bsess onal eurosi paran ia alone restores th specta tors and is fanaticall con inced f their presen although they remain unseen The substi tut for these persons ffered by the dream the *number f st anger* wh take o tice of the specta le ffered them, s precisel the *counter wish* t that singl intimat ly known person for whom th exposure wa intended. *A mber f t anger* m reover ften oc cur in dreams in all sorts f other nnections as *counter wish* they always signif secret It will be seen that even that resti ut on f the old stat of ffairs that occurs in parano om plies with the counte tendency On is no longer alon on is qui posit ly being watched but the spectat rs are *a mber of st ang curiously indeterminat pe ple*

Furthermore repressi n finds a place in the exhib tion-dream F th disagreeable se sa tion of the dream is of course the reaction on th part of the second psychic instance to the f ct that the exhib tionistic cene which has been condem ed by the censorship has never theless succeeded in presenting tself The only way to a oid this ensatio would be to refrain from reviving the scene

In a later chapter we shall deal once again with the feeling of inhib tion. In our dreams i represents to perfection *a conflict of the will a denial* A cording to our unconscious purpose the exhibition is to proceed according to the demands of the censorship it is to come to an end.

The relation of our typical dreams to fairy tales and other fiction and poetry is neither sporadic nor accidental. Sometimes the penetrating insight of the poet has analytically rec ognized the process f transformation of which the poet is otherwise th instrument, and has f ll wed it up in the reverse direct on that is t sa has traced a poem to a dream. A friend has called my ttent on to the following passage in G Kelle s *Der Grune Heinrich* "I do n t wish, dear Lee that you should ever come to realize from experience the exqui te and piquant truth in the situat on of Odysseus when he ppears, naked and covered with mud bef re Nausicaa and her pla mates Would you like to know what t means? Let us for a moment consider the incident closely If you are ever parted f om your home and from all that s dear to you and wander about in a ... h e seen much and ex ... s..nning and glittering in th e es s l el and gracious figures will come to meet you and then you will uddenl discover that you are ragged naked and covered with dust. An indescribable feeling f hame and fear overcomes you you try t cover yourself to hide and you wak up bathed in sweat As l ng as humanity exist this will be the dream of th care-laden, tempest-tossed man and thus H m r has drawn this tuation from th profoundest depths of the eternal nature of humanity

What are the profoundest depths of the eternal nature of humanity which the poet comm nly h pe to awaken n his listen rs but these stirrings f the psychic lif which are roo ed in that e f hildhood, wh h subse quently becomes prehi toric Childish wishes,

Ferenczi has recorded numbe f in resting dreams of nakedness in women which were withou

rarely a clear image in most cases the lack of clothing is so indeterminate that it is described in narrating the dream by an alternative I was in my chemise or my petticoat As a rule the deficiency in clothing is not serious enou h to justify the feeling of shame attached to it For a man who has served in the army naked ness is often replaced by a manner of dressing that is contrary to regulations I was in the street without my sabre and I saw some offi cers approaching or I had no collar or I was wearing checked civilian trousers etc

The persons before whom one is ashamed are almost always strangers whose faces re main indeterminate It never happens in the typical dream that one is reproved or even no ticed on account of the lack of clothing which causes one such embarrassment On the con trary the people in the dream appear to be quite indifferent or as I was able to note in one particularly vivid dream they have stiff and solemn expressions This gives us food for thou ht

The dreamer s embarrassment and the spec tator s indifference constitute a contradiction such as often occurs in dreams It would be more in keeping with the dreamer s feelings if the strangers were to look at him in astonish*ment or were to laugh at him or be outraged* I think however that this obnoxious feature has been displaced by wish fulfilment while the embarrassment is for some reason retained so that the two components are not in agree ment We have an interesting proof that the dream which is partially distorted by wish ful filment has not been properly understood for it has been made the basis of a fairy tale fa miliar to us all in Andersen s version of *The Emperor s New Clothes* and it has more re cently received poetical treatment by Fulda in *The Talisman* In Andersen s fairy tale we are told of two impostors who weave a costly gar ment for the Emperor which shall however be visible only to the good and true The Em peror goes forth clad to this invisible garment and since the imaginary fabric serves as a sort of touchstone the people are frightened into behaving *as though they did not notice* the Em peror s nakedness

But this is really the situation in our dream It is not very venturesome to assume that the unintelligible dream content has provided an incentive to invent a state of undress which gives meaning to the situation present in the memory This situation is thereby robbed of its original meaning and made to serve alien ends But we shall see that uch a misunderstanding of the dream content often occurs through the conscious activity of a second psychic system and is to be recognized as a factor of the final form of the dream and further that in the de velopment of obsessions and phobias similar misunderstandings—still of course within the same psychic personality—play a decisive pa. It is even possible to specify whence the ma terial for the fresh interpretation of the dream is taken The impostor is the dream the Em peror is the dreamer himself and the moraliz ing tendency betrays a hazy knowledge of the fact that there is a question in the latent dream content of forbidden wishes victims of repression The connection in which such dreams appear during my analysis of neurotics proves beyond a doubt that a memory of the dream er s earliest childhood lies at the foundation of the dream Only in our childhood was there a time when we were seen by our relatives as well as by strange nurses servants and visitors, in a state of insufficient clothing and at that time we were not ashamed of our nakedness In the case of many rather older children it may be observed that being undressed has an exciting effect upon them instead of making them feel ashamed They laugh leap about *slap or thump their own bodies* the mother or whoever is present scolds them sayin Fie that is shameful—you mustn t do that! Chil dren often show a desire to di play themselves it is hardly possible to pass through a village in country districts without meeting a two-or three year old child who lifts up his or her blouse or frock before the traveller pos ibly in his honour One of my patients has retained in his conscious memory a scene from his eighth year in which after undressing for bed he wanted to dance into his little sister s room in his shirt but was prevented by the servan In the history of the childhood of neurotics exposure before children of the opposite sex plays a prominent part in paranoia the delu sion of being ob erved while dressing and un dressing may be directly traced to these experi ences and among those who have remained perverse there is a class in whom the childish impulse is accentuated into a symptom the class of *exhibitionists*

This age of childhood in which the sense of shame is unknown seems a paradise when we look back upon it later and paradise itself is

Th ch ld ppe i th f iry tal i o f r there a l ttl child dd nly es t B t he hasn t yth g o t lll

years earlier and which had at that time been frankly admitted as real. Further—and this, perhaps, is not unimportant from the standpoint of the theory of dreams—a recollection from the dreamer's earliest childhood was at the root of this wish also. When the dreamer was a little child—but exactly when cannot be definitely determined—she heard that her mother, during the pregnancy of which she was the outcome, had fallen into a profound emotional depression, and had passionately wished for the death of the child *in her womb*. Having herself grown up and become pregnant, she was only following the example of her mother.

If anyone dreams that his father or mother, his brother or sister, has died, and his dream expresses *grief*, I *should never* adduce this as proof that he wishes any of them dead *now*. The theory of dreams does not go as far as to require this; it is satisfied with concluding that the dreamer has wished them dead at some time or other during his childhood. I fear, however, that this limitation will not go far to appease my critics; probably they will just as energetically deny the possibility that they ever had such thoughts, as they protest that they do not harbour them now. I must therefore reconstruct a portion of the submerged infantile psychology on the basis of the evidence of the present.

Let us first of all consider the relation of children to their brothers and sisters. I do not know why we presuppose that it must be a loving one, since examples of enmity among adult brothers and sisters are frequent in everyone's experience, and since we are so often able to verify the fact that this estrangement originated during childhood, or has always existed. Moreover, many adults who today are devoted to their brothers and sisters, and support them in adversity, lived with them in almost continuous enmity during their childhood. The elder child ill-treated the younger, slandered him, and robbed him of his toys; the younger was consumed with helpless fury against the elder, envied and feared him, or his earliest impulse toward liberty and his first revolt against injustice were directed against his oppressor. The parents say that the children do not agree, and cannot find the reason for it. It is not difficult to see that the character even of a well-behaved child is not the character we should wish to find in an adult. A child is absolutely egoistical; he feels his wants acutely, and strives remorselessly to satisfy them, especially against his competitors, other children, and first of all against *his brothers and sisters*. And yet we do not on that *account* call a child *wicked*—we call him *naughty*; he is not responsible for his misdeeds, either in our own judgment or in the eyes of the law. And this is as it should be; for we may expect that within the very period of life which we reckon as childhood, altruistic impulses and morality will awake in the little egoist, and that, in the words of Meynert, a secondary ego will overlay and inhibit the primary ego. *Morality, of course*, does not develop simultaneously in all its departments, and furthermore, the duration of the amoral period of childhood differs in different individuals. Where this morality fails to develop we are prone to speak of *degeneration*; but here the case is obviously one of arrested development. Where the primary character is already overlaid by the later development, it may be at least partially uncovered again by an attack of hysteria. The correspondence between the so-called hysterical character and that of a naughty child is positively striking. The obsessional neurosis, on the other hand, corresponds to a super-morality, which develops as a strong reinforcement against the primary character that is threatening to revive.

Many persons, then, who now *love* their brothers and sisters, and who would feel bereaved by their death, harbour in their unconscious hostile wishes, survivals from an earlier period, wishes which are able to realize themselves *in dreams*. *It is* however, quite especially interesting to observe the behaviour of little children up to their third and fourth year towards their younger brothers or sisters. So far the child has been the only one; now he is informed that the stork has brought a new baby. The child inspects the new arrival, and expresses his opinion with decision: "The stork had better take it back again!"

I seriously declare it as my opinion that a child is able to estimate the disadvantages which he has to expect on account of a new comer. A connection of mine who now gets on

Cf. also "Analysis of a Phobia in a Five-year-old Boy," *Collected Papers*, III, and "On the Sexual Theories of Children," *Ibid.*, II.

Hans, whose phobia was the subject of the analysis in the above-mentioned publication, cried out ... the age of three and a half while feverish, shortly after the birth of his sister: "But I don't want to have a little sister." In his neurosis, eighteen months later, he frankly confessed the wish that his mother should drop the child into the bath while bathing it, in order that it might die. With all this, Hans was a good-natured, affectionate child, who soon became fond of his sister and took her under his special protection.

now suppressed and forbidden break into the dream behind the unobjectionable and permis sibly conscious wishes of the homeless man and it is for this reason that the dream which is objectified in the legend of Nausicaa regu larly develops into an anxiety dream

My own dream of hurrying upstairs which presently changed into being glued to the stairs is likewise an exhibition dream for it reveals the essential ingredients of such a dream It must therefore be possible to trace it back to experiences in my childhood and the knowl edge of these should enable us to conclude how far the servant s behaviour to me (i e her re proach that I had soiled the carpet) helped her to secure the position which she occupies in the dream Now I am actually able to furnish the desired explanation One learns in a psycho analysis to interpret temporal proximity by material connection two ideas which are ap parently without connection but which occur in immediate succession belong to a unity which has to be deciphered just as an *a* and a *b* when written in succession must be pro nounced as one syllable *ab* It is just the same with the interrelations of dreams The dream of the stairs has been taken from a series of dreams with whose other members I am fa miliar having interpreted them A dream in cluded in this series must belong to the same context Now the other dreams of the series are based on the memory of a nurse to whom I was entrusted for a season from the time when I was still at the breast to the age of two and a half and of whom a hazy recollection has remained in my consciousness According to in formation which I recently obtained from my mother she was old and ugly but very intelli gent and thorou h according to the inferences which I am justified in drawing from my dreams she did not always treat me quite kindly but spoke harshly to me when I showed insufficient understanding of the necessity for cleanliness Inasmuch as the maid endeavoured to continue my education in this respect she is entitled to be treated in my dream as an in carnation of the prehistoric old woman It is to be assumed of course that the child was fond of his teacher in spite of her harsh behaviour

ficient in Schl g/e t gkeit?

(*b*) DREAMS OF THE DEATH OF BELOVED PERSONS

Another series of dreams which may be called typical are those whose content is that a be loved relative a parent brother sister child or the like has died We must at once distin guish two classes of such dreams those in which the dreamer remains unmoved and those in which he feels profoundly grieved by the death of the beloved person even expressing this grief by shedding tears in his sleep

We may ignore the dreams of the first group they have no claim to be reckoned as typical If they are analysed it is found that they signify somethin that is not contained in them that they are intended to mask another wish of some kind This is the case in the dream of the aunt who sees the only son of her sister lying on a bier (p 201) The dream does not mean that she desires the death of her little nephew as we have learned it merely conceals the wish to see a certain beloved per son again after a long separation—the same person whom she had seen after as long an interval at the funeral of another nephew This wish which is the real content of the dream give no cause for sorrow and for that reason no sorrow is felt in the dream We see here that the feeling contained in the dream does not belong to the manifest but to the lat ent dream content and that the affective con tent has remained free from the distortion which has befallen the conceptual content.

It is otherwise with those dreams in which the death of a beloved relative is imagined and in which a painful affect is felt These signify as their content tells us the wish that the per son in question might die and since I may here expect that the feelings of all my readers and of all who have had such dreams will lead them to reject my explanation I must endeavour to rest my proof on the broadest possible basis

We have already cited a dream from which we could see that the wishes represented as fulfilled in dreams are not always current wishes They may also be bygone discarded buried and repressed wishes which we must nevertheless credit with a sort of continued ex istence merely on account of their reappear ance in a dream They are not dead like per sons who have died in the sense that we know death but are rather like the shades in the Odyssey which awaken to a certain degree of life so soon as they have drunk blood The dream of the dead child in the box (p 202) contained a wish that had been present fifteen

wings and become angels. After this explanation, all the brothers and sisters and cousins in the dream now have wings like angels, and—this is the important point—they fly away. Our little angel-maker is left alone; just think, the only one out of such a crowd! That the children romp about a meadow from which they fly away points almost certainly to butterflies—it is as though the child had been influenced by the same association of ideas which led the ancients to imagine Psyche, the soul, with the wings of a butterfly.

Perhaps some readers will now object that the inimical impulses of children toward their brothers and sisters may perhaps be admitted, but how does the childish character arrive at such heights of wickedness as to desire the death of a rival or a stronger playmate, as though all misdeeds could be atoned for only by death? Those who speak in this fashion forget that the child's idea of being dead has little but the word in common with our own. The child knows nothing of the horrors of decay, of shivering in the cold grave, of the terror of the infinite Nothing, the thought of which the adult, as all the myths of the hereafter testify, finds so intolerable. The fear of death is alien to the child, and so he plays with the horrid word, and threatens another child: "If you do that again, you will die, just like Francis died"; at which the poor mother shudders, unable perhaps to forget that the greater proportion of mortals do not survive beyond the years of childhood. Even at the age of eight, a child returning from a visit to a natural history museum may say to her mother: "Mamma, I do love you so; if you ever die, I am going to have you stuffed and set you up here in the room, so that I can always, always see you!" So different from our own is the childish conception of being dead.[1]

Being dead means, for the child, who has been spared the sight of the suffering that precedes death, much the same as being gone, and ceasing to annoy the survivors. The child does not distinguish the means by which this absence is brought about, whether by distance, or estrangement, or death.[2] If during the child's prehistoric years a nurse has been dismissed, and if his mother dies a little while later, the two experiences, as we discover by analysis, form links of a chain in his memory. The fact that the child does not very intensely miss those who are absent has been realized, to her sorrow, by many a mother when she has returned home from an absence of several weeks, and has been told, upon inquiry: "The children have not asked for their mother once." But if she really departs to "that undiscovered country from whose bourne no traveller returns," the children seem at first to have forgotten her, and only subsequently do they begin to remember their dead mother.

While, therefore, the child has its motives for desiring the absence of another child, it is lacking in all those restraints which would prevent it from clothing this wish in the form of a death-wish; and the psychic reaction to dreams of a death-wish proves that, in spite of all the differences of content, the wish in the case of the child is after all identical with the corresponding wish in an adult.

If, then, the death-wish of a child in respect of his brothers and sisters is explained by his childish egoism, which makes him regard his brothers and sisters as rivals, how are we to account for the same wish in respect of his parents, who bestow their love on him, and satisfy his needs, and whose preservation he ought to desire for these very egoistical reasons?

Towards a solution of this difficulty we may be guided by our knowledge that the very great majority of dreams of the death of a parent refer to the parent of the same sex as the dreamer, so that a man generally dreams of the death of his father, and a woman of the death of her mother. I do not claim that this happens constantly, but that it happens in a great majority of cases is so evident that it requires explanation by some factor of general significance.[3] Broadly speaking, it is as though a sexual preference made itself felt at an early age,

---

[1] To my astonishment, I was told that a highly intelligent boy of ten, after the sudden death of his father, said: "I understand that father is dead, but I can't see why he does not come home to supper." Further material relating to this subject will be found in the section *Kinderseele*, edited by Frau Dr. von Hug-Hellmuth, in *Imago*, vol. i–v, 1912–18.

[2] The observation of a father trained in psychoanalysis was able to detect the very moment when his very intelligent little daughter, aged four, realized the difference between *being away* and *being dead*. The child was being troublesome at table, and noted that one of the waitresses in the *pension* was looking at her with an expression of annoyance. "Josephine ought to be dead," she thereupon remarked to her father. "But why dead?" asked the father soothingly. "Wouldn't it be enough if she went away?" "No," replied the child, "then she would come back again." To the unbounded self-love (narcissism) of the child, every inconvenience constitutes the crime of *lèse majesté*, and, as in the Draconian code, the child's feelings prescribe for all such crimes the one invariable punishment.

[3] The situation is frequently disguised by the intervention of a tendency to punishment, which, in the form of a moral reaction, threatens the loss of the beloved parent.

very well with a sister who is four years her junior responded to the news of this sister s arrival with the reservation But I shan t give her my red cap anyhow If the child should come to realize only at a later stage that its happiness may be prejudiced by a younger brother or sister its enmity will be aroused at this period I know of a case where a girl not three years of age tried to strangle an infant in its cradle because she suspected that its continued presence boded her no good Children at this time of life are capable of a jealousy that is perfectly evident and extremely intense Again perhaps the little brother or sister really soon disappears and the child once more draws to himself the whole affection of the household then a new child is sent by the stork is it not natural that the favourite should conceive the wish that the new rival may meet the same fate as the earlier one in order that he may be as happy as he was before the birth of the first child and during the interval after his death? Of course this attitude of the child towards the younger brother or sister is under normal circumstances a mere function of the difference of age After a certain interval the maternal instincts of the older girl will be awakened towards the helpless new born infant

Feelings of hostility towards brothers and sisters must occur far more frequently in children than is observed by their obtuse elders

In the case of my own children who followed one another rapidly I missed the opportunity of making such observations I am now retrieving it thanks to my little nephew whose undisputed domination was disturbed after fifteen months by the arrival of a feminine rival I hear it is true that the young man behaves very chivalrously toward his little sister that he ki ses her hand and strokes her but in spite of this I have convinced myself that even before the completion of his second year he is using his new command of langua e to criticize this person who to him after all seems superfluous Whenever the conversation turns upon her he chimes in and cries angrily Too (l)ittle too (l)ittle! During the la t few months since the child has outgrown thi disparagement owing to her splendid development he has found another reason for his insistence that she does not deserve so much attention He reminds us on every suitable pretext She hasn t any teeth We all of us recollect the case of the eldest dau hter of another sister of mine The child who was then six years of age spent a full half hour in going from one aunt to another with the question 'Lucie can t understand that yet can she? Lucie was her rival—two and a half years younger

I have never failed to come across this dream of the death of brothers or sisters denotin an intense hostility e g I have met it in all my female patients I have met with only one exception which could easily be interpreted into a confirmation of the rule Once in the course of a sitting when I was explaining this state of affairs to a female patient since it seemed to have some bearing on the symptoms under consideration that day she answered to my astonishment that she had never had such dreams But another dream occurred to her which presumably had nothin to do with the case—a dream which she had first dreamed at the age of *four* when she was the younge t child and had since then dreamed repeatedly *A number of children all her brothers a d sisters with her boy and girl cousins were romping*
grew win
no idea c
we can hardly fail to recognize it as a dream of the death of all the brothers and sisters in its original form and but little influenced by the censorship I will venture to add the following analysis of it on the death of one out of this large number of children—in this case the children of two brothers were brou ht up together as brothers and sisters—would not our dreamer at that time not yet four years of age have asked some wise grown up person What becomes of children when they are dead? The answer would probably have been 'They grow

etc A particularly clever and l ely little gi l not yet four years f age in whom this trait of child psych logy is unusually tran parent says frankly Now mummy can go away then daddy must marry me and I will be his wife No does this wish by any mean ex clude th po bility that the child may most t d rly love its mother If the little boy is allowed to sleep at his mother s s de wh ever his father goes on a journey and if after his fathers ret rn he h s t go back to the nursery to a person whom h likes far less the wish may readily ri that his father m ght always be bse t, o that he might keep his place be s d his dea beautiful mamma and the fathe d th s bvi u ly a mean for the at tainment f this wish f r the child s experience has taught him that *dead* f lks like grandpapa f r example are always absent they never com back.

While such obs rvati ns of youn children readily c ommod t themselves t the inter pretation s ggested they do not it is true carry the c mplet c vict on which is fo ced upo a physician by th psycho-analys s of adult eu otics The dreams f ne rotic pat e ts are ommun cated with preliminaries of such a nat re that th r int rpret tion as wi h-dreams bec mes itabl One day I find lady de pressed and weep g She says "I d n t want to see my relati es any more they mu t hud d r at m Thereupon lm st without any trans tio sh tells me that he ha remem bered dream whose significanc of course she does not understand She dreamed t when she was four years old and it was this *A fox or a lynx is walking bout the o f then som th g fall down or sh falls down nd after that her m ther is arried out f the house—dead* wh e t the dream weeps b tterly I have no oo e inf rmed he that this dream must signify a hildish wi h t see he m ther dead and th t t is beca se f this dream that he thinks that he relati es m st shudder at her than sh furnishes m terial in explan tion of the dream. Lynx-eye s an opp obrious epithet which a street boy once bestowed on her when he was a ery small child and when she was three years old a brick o tile f ll on he m th head so that he bled profusely

I on had occasion t make tho o gh study of young girl who was passing thro gh arious psychic tates In the stat of frenzied on fusion with which her illness began, th patient man fest d a qui peculiar version f her mother she struck her and abused her whenever he approached the bed while at the same period he was affectionate and submissi e to a much older sister Then there followed a lucid but rather apathetic cond tion with badly dis tu bed sleep. It was i this phase that I began to treat her and to analyse her dreams An enormous number of th se dealt in a more or less veiled fa hion w th the death of the girl s mother now she was present at the funeral of an old woman, now he saw herself and her ister sitting t a table dressed in mourn ng the meaning of the dreams c uld *not* be doubt ed. Duri g her progressi e improvement hys terical phob as made the r appearance the most di tres of which was the fear that som th g had happened to her mo her Wher ever he mi ht be at the time she had then to hurry home order to co nce herself that her mother was still alive Now this case con s dered n conjunction with the rest of my ex perie ce was ery instructive it howed, in pol glot *translations* as it were the different wa s n wh ch the psychic apparatus reacts to the same exciting idea In the state of con fu on which I regard as an overthrow of the second psychic instance by the first in stance at other times suppressed, the uncon ous enm ty towards the mother gained the upper hand and found physical express on then, when the patient became calm r the in surrection was suppressed, and the domination of the censorship restored, and thus enmity had acces only to the realms of dreams, in which it realized the wish that the mother might die and fte the normal c ndition had been still f rther trengthened it created the ex essive c nc rn for the mother as a hysterical counter react on and *defensive phenom non.* In the light of these con derations it is no longer inexplicable why hysterical girls are so often extravagantly attached to their mothers

On anoth occas on I had an opportunity of obtaining a profound insight into the un conscious psychic lif of a young man f r whom an obses i nal neurosis made lif almost unendurable so that h could not go int the

might ha e been mmitted in the city It goes without sayi g that this man was as moral he was highly cultured. The analysis—which, by the way led to cure—revealed, as the basis of this distres ing bse sion murderous impulses in respect of his rather overstrict

as though the boy regarded his father and the girl her mother as a rival in love—by whose re moval he or she could but profit

Before rejecting this idea as monstrous let the reader again consider the actual relations between parents and children We must distin guish between the traditional standard of con duct the filial piety expected in this relation and what daily observation shows us to be the fact More than one occasion for enmity lies hidden amidst the relations of parents and chil dren conditions are present in the greatest *abundance under which wishes which cannot* pass the censorship are bound to arise Let us first consider the relation between father and son In my opinion the sanctity with which we have endorsed the injunctions of the Deca logue dulls our perception of the reality Per haps we hardly dare permit ourselves to per ceive that the greater part of humanity neglects *to obey the fifth commandment In the lowest* as well as in the highest strata of human so ciety filial piety towards parents is wont to recede before other interests The obscure leg ends which have been handed down to us from the primeval ages of human society in myth ology and folklore give a deplorable idea of the despotic power of the father and the ruthless ness with which it was exercised Kronos de vours his children as the wild boar devours the litter of the sow Zeus emasculates his father and takes his place as ruler The more tyranni cally the father ruled in the ancient family the more surely must the son as his appointed suc cessor have assumed the position of an enemy and the greater must have been his impatience to attain to supremacy through the death of his father Even in our own middle class families the father commonly fosters the growth of the germ of hatred which is naturally inherent in the paternal relation by refusing to allow the son to be a free agent or by denying him the means of becoming so A physician often has occasion to remark that a son s grief at the loss of his father cannot quench his gratification that he has at last obtained his freedom Fath ers as a rule cling desperately to as much of the sadly antiquated *potestas patris familias* as still survives in our modern society and the poet who like Ibsen puts the immemorial strife between father and son in the foreground of his drama is sure of his effect The cau es of conflict between mother and dau hter aris *when the daughter grows up and finds herself* watched by her mother when she longs for real sexual freedom while the mother is reminded by the budding beauty of her dau hter that for her the time has come to renounce sexual claims

All these circumstances are obvious to every one but they do not help us to explain dreams *of the death of their parents in persons* for whom filial piety has long since come to be un questionable We are however prepared by the foregoing discussion to look for the or n of a death wish in the earliest years of child hood

In the case of psychoneurotics analysis con firms this conjecture beyond all doubt For *analysis tells us that the sexual* wi hes of the child—in so far as they deserve this designation in their nascent state—awaken at a very early age and that the earliest affection of the girl child is lavished on the father while the earli est infantile desires of the boy are directed up on the mother For the boy the father and for the girl the mother becomes an obnoxious rival, and we have already shown in the case of bro thers and sisters how readily in children this feeling leads to the death wish As a general rule sexual selection oon makes its appear ance in the parents it is a natural tendency for the father to spoil his little daughters and for the mother to take the part of the sons while both so long as the glamour of sex does not prejudice their judgment are strict in train the children The child is perfectly *conscious* of this partiality and offers resistance to the parent who opposes it To find love in an adult is for the child not merely the satisfaction of a special need it means also that the child s will is indulged in all other respects Thus the child is obeying its own sexual instinct and at the same time reinforcing the stimulus proceeding from the parents when its choice between the parents corresponds with their own

The signs of these infantile tendencies are for the most part over looked and yet some of them may be observed even after the early years of childhood An eight year old girl of my acquaintance whenever her mother is called away from the table takes advantage of her ab ence to proclaim herself her successor Now I shall be Mamma Karl do you want some more vegetables? Have some more do

father—impulses which to his astonishment had consciously expressed them elves when he was seven years old but which of course had originated in a much earlier period of his child hood After the painful illness and death of his father when the young man was in his thirty first year the obsessive reproach made its appearance which transferred itself to strangers in the form of this phobia Anyone capable of wishing to push his own father from a mountain top into an abyss cannot be trusted to spare the lives of persons less closely related to him he therefore does well to lock himself into his room

According to my already extensive experi ence parents play a leading part in the infantile psychology of all persons who subsequently be come psychoneurotics Falling in love with one parent and hating the other forms part of the permanent stock of the psychic impulses which arise in early childhood and are of such importance as the material of the subsequent neurosis But I do not believe that psychoneu rotics are to be sharply distinguished in this respect from other persons who remain normal —that is I do not believe that they are capable of creating something absolutely new and pe culiar to themselves It is far more probable— and this is confirmed by incidental observations of normal children—that in their amorous or hostile attitude toward their parents psycho neurotics do no more than reveal to us by mag nification something that occurs less markedly and intensively in the minds of the majority of children Antiquity has furnished us with legend ary matter which corroborates this belief and the profound and universal validity of the old legends is explicable only by an equally uni versal validity of the above mentioned hypothe sis of infantile psychology

I am referring to the legend of King Oedipus and the *Oedipus Rex* of Sophocles Oedipus the son of Laius king of Thebes and Jocasta is exposed as a suckling because an oracle had informed the father that his son who was still unborn would be his murderer He is rescued

native place for he is destined to become the murderer of his father and the husband of his mother On the road leading away from his supposed home he meets King Laius and in a sudden quarrel strikes him dead He comes to Thebes where he solves the riddle of the Sphinx who is barring the way to the city whereupon he is elected king by the grateful Thebans and is rewarded with the hand of Jocasta He reigns for many years in peace and honour and begets two sons and two daughters upon his unknown mother until at last a plague breaks out—which causes the Thebans to con sult the oracle anew Here Sophocles trag edy begins The messengers bring the reply that the plague will stop as soon as the mur derer of Laius is driven from the country But where is he?

Where shall be found,
Faint and hard to be known the trace of the ancient guilt?

The action of the play consists simply in the disclosure approached step by step and ar tistically delayed (and comparable to the work of a psycho analysis) that Oedipus himself is the murderer of Laius and that he is the son of the murdered man and Jocasta Shocked by the abominable crime which he has unwittingly committed Oedipus blinds himself and departs from his native city The prophecy of the oracle has been fulfilled

The *Oedipus Rex* is a tragedy of fate its tragic effect depends on the conflict between the all powerful will of the gods and the vain efforts of human beings threatened with dis aster resignation to the divine will and the perception of one s own impotence is the lesson which the deeply moved spectator is supposed to learn from the tragedy Modern authors have therefore sought to achieve a similar tragic effect by expressing the same conflict in stories of their own invention But the playgoers have looked on unmoved at the un availing efforts of guiltless men to avert the fulfilment of curse or oracle the modern trag edies of destiny have failed of their effect

If the *Oedipus Rex* is capable of moving a modern reader or playgoer no less powerfully than it moved the contemporary Greeks the only possible explanation is that the effect of the Greek tragedy does not depend upon the conflict between fate and human will but up on the peculiar nature of the material by which this conflict is revealed There must be a voice within us which is prepared to acknowledge the compelling power of fate in the *Oedipus* while we are able to condemn the situations occurring in *Die Ahnfrau* or other tragedies of fate as arbitrary inventions And there actually is a motive in the story of King Oedipus which ex plains the verdict of this inner voice His fate moves us only because it might have been our

vailing conception a conception for which Goethe was first responsible Hamlet represents the type of man whose active energy is paraly ed by excessive intellectual activity Sicklied o er with the pale cast of thought According to another conception the poet has endeavoured to portray a morbid irresolute character on the verge of neurasthenia The plot of the drama however shows us that Hamlet is by no means intended to appear as a character wholly incapable of action On two separate occasions we see him as ert himself once in a sudden outburst of rage when he stabs the eavesdropper behind the arras and on the other occasion when he deliberately and even craftily with the complete unscrupulousness of a prince of the Renaissance sends the two courtiers to the death which was intended for himself What is it then that inhibits him in accomplishing the task which his father s ghost has laid upon him? Here the explanation offers itself that it is the peculiar nature of this task Hamlet is able to do anything but take vengeance upon the man who did away with his father and has taken his father's place with his mother—the man who shows him in realization the repressed desires of his own childhood The loathing which should have driven him to revenge is thus replaced by self reproach by conscientious scruples which tell him that he himself is no better than the murderer whom he is required to punish I have here translated into consciousness what had to remain unconscious in the mind of the hero if anyone wishes to call Hamlet an hysterical subject I cannot but admit that this is the deduction to be drawn from my interpretation The sexual aversion which Hamlet expresses in conversation with Ophelia is perfectly consistent with this deduction—the same sexual aversion which during the next few years was increasingly to take possession of the poet s soul until it found its supreme utterance in *Timon of Athens* It can of course be only the poet s own psychology with which we are confronted in *Hamlet* and in a work on Shakespeare by Georg Brandes (1896) I find the statement that the drama was composed immediately after the death of Shakespeare s father (1601)—that is to say when he was still mourning his loss and during a revival as we may fairly assume of his own childish feelings in respect of his father It is known too that Shakespeare s son who died in childhood bore the name of Hamnet (identical with Hamlet) Just as *Hamlet* treats of the relation of the son to his parents so *Macbeth* which was written about the [illegible] period is based upon the theme of childlessness Just as all neurotic symptoms like dreams themselves are capable of hyper interpreta[illegible] and even require such hyper interpretation before they become perfectly intelligible o every genuine poetical creation must have proceeded from more than one motive mo e than one impulse in the mind of the poet and must admit of more than one interpretation I have here attempted to interpret only the deepest stratum of impulse in the mind of th crea tive poet

With re ard to typical dreams of the death of relatives I must add a few words upon their significance from the point of view of the theory of dreams in general These dreams show us the occurrence of a very unusual state of th ngs they show us that the dream thought created by the repressed wish completely es capes the censorship and is transferred to the dream without alteration Special co ditio s must obtain in order to make this possible. The following two factors favour the production of these dreams first this is the last wish that we could credit our elves with harbouring we believe such a wish would never occur to us even in a dream the dream-censorship is therefore unprepared for this monstrosity just as the laws of Solon did not foresee the necessity of establishing a penalty for patricide. Secondly the repressed and unsuspected wi h is in this special case frequently met half way by a residue from the day s experience in the form of some *concern* for the life of the beloved person This anxiety cannot enter into the dream otherwise than by taking advantage of *the corresponding wish but the wish is able to* mask itself behind the concern which has been aroused during the day If one is inclined to think that all this is really a very much simpler process and to imagine that one merely continues during the night and in one s dream what was begun durin the day one removes the dreams of the death of those dear to us

Da f wrath.—Ed

of my children has treated them successfully when they have been ill and moreover has given them presents whenever he could find any excu e for doing so He paid us a visit on the day of the dream and my wife noticed that he looked tired and exhausted At night I dream of him and my dream attributes to him certain of the symptoms of Basedow s disease If you were to disre ard my rules for dream interpretation you would understand this dream to mean that I am concerned about the health of my friend and that this concern is realized in the dream It would thus constitute a con tradiction not only of the assertion that a dream is a wish fulfilment but also of the assertion that it is accessible only to egoistical impulses But will those who thus interpret my dream explain why I should fear that Otto has Base dow s disease for which diagnosis his appear ance does not afford the slightest justification? My analysis on the other hand furnishes the following material deriving from an incident which had occurred six years earlier We were driving—a small party of us including Pro fessor R—in the dark through the forest of N which lies at a distance of some hours from where we were staying in the country The driv er who was not quite sober overthrew us and the carriage down a bank and it was only by good fortune that we all escaped unhurt But we were forced to spend the ni ht at the near est inn where the news of our mishap aroused great sympathy A certain gentleman who showed unmistakable symptoms of *morbus Basedowii*—the brownish colour of the skin of the face and the protruding eyes but no goitre —placed himself entirely at our disposal and asked what he could do for us Professor R answered in his decisive way Nothing except lend me a nightshirt Whereupon our generous friend replied I am sorry but I cannot do that and left us

In continuing the analysis it occurs to me that Basedow is the name not only of a physician but also of a famous pedagogue (Now that I am wide awake I do not feel quite sure of this fact) My friend Otto is the person whom I have asked to take charge of the physical edu cation of my children—especially during the age of puberty (hence the nightshirt) in case any thing should happen to me By seeing Otto in my dream with the morbid symptoms of our above mentioned generous helper I clearly mean to say If anything happens to me he will do just as little for my children as Baron L did for us in spite of his amiable offers The egoistical flavour of this dream should now be obvious enough

But where is the wish fulfilment to be found in this? Not in the vengeance wreaked on my friend Otto (who seems to be fated to be badly treated in my dreams) but in the following circumstance Inasmuch as in my dream I represented Otto as Baron L I likewise identified myself with another person namely with Professor R for I have asked something of Otto, just as R asked something of Baron L at the time of the incident I have described And this is the point For Professor R has gone his way independently outside academic circles just as I myself have done and has only in his later years received the title which he had earned long before Once more then I want to be a professor! The very phrase *in his later years* is a wish fulfilment for it means that I shall live long enough to steer my boys through the age of puberty myself

Of other typical dreams in which one flies with a feeling of ease or falls in terror I know nothing from my own experience and whatever I have to say about them I owe to my psychoanalyses From the information thus obtained one must conclude that these dreams also reproduce impressions made in childhood—that is that they refer to the games involving rapid motion which have such an extraordinary attraction for children Where i the uncle who has never made a child fly by running with it across the room with outstretched arms or has never played at falling with it by rocking it on his knee and then suddenly straightenin his leg or by lifting it above his head and suddenly pretending to withdraw his supporting hand? At such moments children shout with joy and insatiably demand a repetition of the perform ance especially if a little fright and dizziness

not been as thorough as we might have been—in short whenever we feel the burden of responsibility

For a further explanation of examination dreams I have to thank a remark made by a colleague who had studied this subject who once stated in the course of a scientific discussion that in his experience the examination dream occurred only to persons who had passed the examination never to those who had flunked We have had increasing confirmation of the fact that the anxiety dream of examination occurs when the dreamer is anticipatin a responsible task on the followin day with the possibility of dis rnce recour e will then be had to an occasion in the past on which a great anxiety proved to have been without real justification having indeed been refuted by the outcome Such a dream would be a very striking example of the way in which the dream content is misunderstood by the waking instance The exclamation which is regarded as a protest against the dream But I am already a doctor etc would in reality be the consolation offered by the dream and should therefore be worded as follows Do not be afraid of the morrow think of the anxiety which you felt before your matriculation yet nothin happened to justify it for now you are a doctor etc But the anxiety which we attribute to the dream really has its origin in the residues of the dr am day

The tests of this interpretation which I have been able to make in my own case and in that of others although by no means exhaustive were entirely in its favour For example I failed in my examination for the doctor s degree in medical jurisprudence never once has the matter worried me in my dreams while I have often enough been examined in botany zoology and chemistry and I sat for the examinations in these subjects with well justified anxiety but escaped disaster throu h the clemency of fate or of the examiner In my dreams of school examinations I am always examined in history a subject in which I passed brilliant [illegible]

[illegible]

[illegible]

fact that on the examination paper which I returned to him I had crossed out with my fingernail the second of three questions as a hint that he should not insist on it One of my patients who withdrew before the matriculation examination only to pass it later but failed in the officer s examination o that he did not become an officer tell me that he of en dreams of the former examination but never of the latter

W Stekel who was the first to interpret the *matriculation dream* maintains that this dream invariably refers to sexual experiences and sexual maturity This has frequently been confirmed in my experience

VI The Dream Work

ALL other previous attempts to solve the problems of dreams have concerned themselves directly with the manifest dream content as it is retained in the memory They have sought to obtain an interpretation of the dream from this content or if they dispensed with an interpretation to base their conclusions concerning the dream on the evidence provided by this content We however are confronted by a different set of data for us a new psychic material interposes itself between the dream conte t and the results of our investigations the la t dream content or dream thoughts which are obtained only by our method We develop the solution of the dream from this latent content and not from the manifest dream content We are thus confronted with a new problem an entirely novel task—that of examinin and tracing the relations between the latent dream thoughts and the manifest dream content and the proce ses by which the latter has grown out of the former

The dream thoughts and the dream content pre ent themselves as two descriptions of the same content in two different languages or to put it more clearly the dream content appears to us as a translation of the dream thoughts into another mode of expression whose symbols and laws of composition we must learn by comparing the origin with the tran lation The dream thou hts we can understand without further trouble the moment we have ascertained them The dream content i as it were presented in hieroglyphics whose symbols must be translated one by one into the language of the dream thoughts It would of course be incorrect to attempt to read these symbols in accordance with their values as pictures instead of in accordance with their meaning as symbols For instance I have before me a picture puzzle (rebus)—a house upon whose roof there is a boat then a single letter then a running figure, whose head has been omitted and o on As a critic I might b tempted to judge this composition and its elements to be non en al A boat

made po sible by the existence of other more fundamental modes of connection In respect of the great majority of the groups of thoughts re vealed by analysis we are obliged to admit that they have already been active in the formation of the dream for if we work through a succes sion of such thoughts which at first sight seem to have played no part in the formation of the dream we suddenly come upon a thought which occurs in the dream content and is indispen sable to its interpretation but which is never theless inaccessible except through this chain of thoughts The reader may here turn to the dream of the botanical monograph which is obviously the result of an astonishing degree of condensation even thou h I have not given the complete analy is

But how then are we to ima ine the psy chic condition of the sleeper which precedes dreaming? Do all the dream thoughts exist side by side or do they pursue one another or are there several simultaneous trains of thought proceeding from different centres which sub sequently meet? I do not think it is necessary at this point to form a plastic conception of the psychic condition at the time of dream formation But let us not forget that we are concerned with *unconscious* thinking and that the process may easily be different from that which we observe in ourselves in de liberate contemplation accompanied by con sciousness

The fact however is irrefutable that dream formation is based on a process of condensa tion How then is this condensation effected?

Now if we consider that of the dream thou hts ascertained only the most restricted number are represented in the dream by means of one of their conceptual elements we might conclude that the condensation is accomplished by means of omission inasmuch as the dream is not a faithful translation or projection point by point of the dream thou hts but a very incomplete and defective reproduction of them This view as we shall soon perceive is a very inadequate one But for the present let us take it as a point of departure and ask ourselves If only a few of the elements of the dream thoughts make their way into the dream con tent what are the conditions that determine their selection?

In order to solve this problem let us turn our attention to tho e elements of the dream con tent which must have fulfilled the cond tions for which we are looking The mo t suitable material for this investigation will be a dream to whose formation a particularly intense con densation has contributed I select the dream cited on page 07 of the botanical mono graph

I

Dream content *I have written a monograph*

the plant is bound up in this copy as in a herbarium

The most prominent element of this dream is the *botanical monograph* This is derived from the impressions of the dream-day I had actually seen a *monograph on the genus Cyclamen* in a bookseller s window The men tion of this genus is lacking in the dream-con tent only the monograph and its relation to botany have remained The *botanical mono graph* immediately reveals its relation to the *work on cocaine* which I once wrote from co caine the train of thou ht proceeds on the o e hand to a *Festschrift* and on the other to my friend the oculist Dr *Koenigstein* who was partly responsible for the introduction of co caine as a local anaesthetic Moreover Dr Koeni stein is connected with the recollection of an interrupted conversation I had had with him on the previous evenin and with all orts of ideas relating to the remuneration of medi cal and surgical services among colleagues This conversation then is the actual dream stimu lus the monograph on cyclamen is also a real incident but one of an indifferent nature as I now see the *botanical monograph* of the dream proves to be a *common mean* between the two experiences of the day taken over unchanged from an indifferent impression and bound up with the psychically significant ex perience by means of the most copious as o ciations

Not only the combined idea of the *botanical monograph* however but also each of its ep arate elements *botanical* and *monograph* pene trates farther and farther by manifold associations into the confused tangle of the dream thoughts To *botanical* belong the recol lections of the person of Professor Gartner (German *Gartner=gardener*) of his *blooming* wife of my patient whose name is *Flora* and of a lady concerning whom I told the story of the forgotten *flowers Ga tner* again leads me to the laboratory and the conversation with *Koenigstein* and the allusion to the two female pa tients belongs to the ame conversation From

referred to an impress on of the dreame s childhood If this s c rrect it must ha e re f rr d to the wet nurse of the dreamer who is n w a man of nearly thirty years of age The bo om of the nurse is in real ty an nn f r the child Th n rse as well s Daudet s *Sappl o* appears n allusion to his rece tly abandoned mistress

Th (elder) brother of the patient also appears in the dream-co t nt he is *up tairs* whil th dre mer hims lf is *down tai s* This again s an inver on for the br ther a I happe to know has lost hi cial pos t on hile my pat e t h.s retained hi In relating the dream co tent the dr amer a oided .ay in that h br ther was upsta rs a d that he him elf wa d wnstairs This would have been to ob o s an expressio f r in Austria we .ay that man is *o the gro ind fl or* wh n h ha l st his f rtu e and s cial po tion just as we say that he h *come down* Now the fact that at th po t the dream somethi is repre e ted in erted mu t ha e a mea g and th e n m st apply to some other elat betwe n th d m thoughts a d the d eam-c ntent The e s an ind at on which sug est how this in ers o t be u d rstood It b ou ly pplies to th e d f th dream wh e the um tances f limbing a e the ver f tho de nbed in *S ppho* Now t is d t what in ers on s meant I *S ppho* the m carries th woman wh sta ds in a sexu l relati n to him the dream tho hts co ly the e is a ef nc to a woman car ry g man a d as this co ld occu ly in childhood, the efe e e s once m e to the se wh carrie th heavy hild Thus the final port of th dre m uc eeds i represen ing S pph d the u in the .ame allu. n

Just th am *S pph* has t b en s l ct ed by the poet w thout efe c t a Lesb n pra t e th portions f th d eam in whi h peopl are busy *p t ir* and *down to s bove* d *beneath* po t to f nci of exu l c n te t with which the d mer s occup ed and wh ch, supp sed cra ings re n t uncon ct d w th hi u is Dream int rp tation tself doe ot h w that th s f cie and t m m ri f ct al happeni gs it ly f m hes with set f th ught and lea t t t d t rmine the act l valu In thi ase re l d imagi ed happe ing appea t f t f q al val e—and t nly h re b t l th reat on of m important psy chi truct res than dream A large company as we al dy k w ignifies a cret. The

t t ku women s favour Through the mea um o a t experience indiffe e t in it.elf the ep ode of the gentleman who talks angrily of the King of Italy refers to the intru. on of people of low rank nto aristocratic society It is as though the w rning which Daudet g ves to young men wer to be supplemented by a imilar warning appl cable to a suckling child

I the two dreams here cited I ha e hown by l cs whe e o e of the eleme ts of the dre m recurs in th dream thou h.s in order t make the mult ple relatio s of the former more bv ous Since howe er the a alys s of these dreams has not been c rried to comple t o it w ll probably be worth while to con rd r to

The chief pers n in the dream content s u y patient Irma who s s en with the fe tu es wh ch belon to her waking l fe and who therefo e in th first instance rep esents herself But her att tude as I examin her at the window is

Inasmuch as Irma u a up bra wh ch r calls my anxi ty about my eld st dau hter she comes to represe t th s child f mi e behind whom connected with h r by the dent ty f the r names is co ceal d the perso of the patie t who died from th effe ts of pois In the fu ther course of the dream the s gn fica ce of Irma s personality changes (w thout the alt ratio of her image as it is seen in the d m) she be omes e of the child en wh m we exam e in the pub lic dispe saries f child n s disea.es whe e my frie ds di play th diffe e c n th men tal c paciti s The tr tion was obviously effected by the dea of my littl daught r Ow ing to h unwilli gn ss t open her mouth the s me Irm titutes an all n to another

is downstairs and he is angry with his brother because they are so hurried (This part obscure) *Besides it was already decided upon their arrival who was to go upstairs and who down Then he goes alone up the hill towards the city and he walks so heavily and with such difficulty that he cannot move from the spot easily*

The difficulty experienced in climbing the hill was o distinct that for some time after waking he was in doubt whether the experience was a dream or the reality

Judged by the manifest content this dream can hardly be eulogized Contrary to the rules I shall begin the interpretation with that portion to which the dreamer referred as being the most distinct

The difficulty dreamed of and probably experienced during the dream—difficulty in climbing accompanied by dyspnoea—was one of the symptoms which the patient had actually exhibited some years before and which in conjunction with other symptoms was at the time attributed to tuberculosis (probably hysterically simulated) From our study of exhibition dreams we are already acquainted with this sensation of being inhibited in motion peculiar to dreams and here again we find it utilized as material always available for the purposes of any other kind of representation The part of the dream content which represents climbing as difficult at first and easier at the top of the hill made me think while it was being related of the well known masterly introduction to Daudet s *Sappho* Here a young man carries the woman he loves upstairs she is at first as light as a feather but the higher he climbs the more she weighs and this scene is symbolic of the pro ress of their relation in describing which Daudet seeks to admonish young men not to lavish an earnest affection upon girls of humble origin and dubious antecedents Although I knew that my patient had recently had a love affair with an actress and had broken it off I hardly expected to find that the interpretation which had occurred to me was correct The situation in Sappho is actually the *reverse* of that in the dream for in the dream climbin was difficult at the first and easy later on in the novel the symbolism is pertinent only if what was at first easily carried finally proves to be a heavy burden To my astonishment the patient remarked that the interpretation fitted in very well with the plot of a play which he had een the previous evenin The play was called *Rund um Wien* (*Round about Vienna*) and treated of the career of a girl who was at first respectable, but who subsequently lapsed into the *de monde* and formed relations with highly placed lovers thereby *climbing* but finally he went *downhill* faster and faster This play reminded him of another entitled *Von Stufe zu Stufe* (*From Step to Step*) the poster advertising which had depicted *a flight of stairs*

To continue the interpretation The actress with whom he had had his most recent and complicated affair had lived in X treet There is no inn in this street However while he was spending part of the summer in Vienna for the sake of this lady he had lod ed (German *abgestiegen=stopped* literally *stepped off*) at a small hotel in the neighbourhood When he was leaving the hotel he aid to the cab-driver

I am glad at all events that I didn t get any vermin here! (Incidentally the dread of vermin is one of his phobias) Whereupon the cab-driver answered How could anybody stop there! That isn t a hotel at all it s really nothing but a *pub!*

The *pub* immediately reminded him of a quotation

Of a wonderful host
I was lately a guest

But the host in the poem by Uhland is an *apple tree* Now a second quotation continues the train of thou ht

FAUST *(dancing with the young witch)*
A lovely dream once came to me
I then beheld an apple tree
And there two fairest apples shone
They lured me so I *climbed thereon*

THE FAIR ONE
Apples have been desired by you
Since first in Paradise they grew
And I am moved with joy to know
That such within my garden grow

There is not the slightest doubt what is meant by the apple tree and the apples A beautiful bosom stood high mong the charms by which the actress had bewitched our dreamer

Judging from the context of the analysis we had every reason to assume that the dream

I est m t g the gnifi f thi p g we m y ecall th me g f d ms f cl mb g tairs as expla ned th h pt o Symb l m

try *trimethylamin* which receives support from several quarters finds its way into the dream-content. *Amyls* too might have got into the dream-content unchanged, but it yields to the influence of the *Wilhelm* group inasmuch as out of the whole range of recollections covered by this name an element is sought out which is able to furnish a double determination for *amyls*. *Propyls* is closely associated with *amyls*; from the *Wilhelm* group comes Munich with its propylaeum. Both groups are united in *propyls—propylaeum*. As though by a compromise this intermediate element then makes its way into the dream-content. Here a common mean which permits of a multiple determination has been created. It thus becomes palpable that a multiple determination must facilitate the penetration into the dream-content. For the purpose of this mean formation a displacement of the attention has been unhesitatingly effected from what is really intended to something adjacent to it in the associations.

The study of the dream of Irma's injection has now enabled us to obtain some insight into the process of condensation which occurs in the formation of dreams. We perceive, as peculiarities of the condensing process, selection of those elements which occur several times over in the dream-content, the formation of new unities (composite persons, mixed images) and the production of common means. The purpose which is served by condensation and the means by which it is brought about will be investigated when we come to study in all their bearings the psychic processes at work in the formation of dreams. Let us for the present be content with establishing the fact of dream condensation as a relation between the dream thought and the dream-content which deserves attention.

The condensation work of dreams becomes most palpable when it takes words and means as its object. Generally speaking words are often treated in dreams as things and therefore undergo the same combinations as the ideas of things. The results of such dreams are comical and bizarre word formations.

1 A colleague sent an essay of his in which he had, in my opinion, overestimated the value of a recent physiological discovery and had expressed himself in recover in extravagant terms. On the following night I dreamed a sentence which ... of the superlatives *colossal pyramidal* but it was not easy to say where it came from. At last the monster fell apart into the two names *Nora* and *Ekdal* from two well known plays by Ibsen. I had previously read a newspaper article on Ibsen by the writer whose latest work I was now criticising in my dream.

2 One of my female patients dreams that *a man with a fair beard and a peculiar glittering eye is pointing to a sign board attached to a tree which reads uclamparia—wet*.

Analysis—The man was rather authoritative looking and his peculiar glittering eye at once recalled the church of San Paolo near Rome where she had seen the mosaic portraits of the Popes. One of the early Popes had a golden eye (this is really an optical illusion to which the guides usually call attention). Further associations showed that the general physiognomy of the man corresponded with her own clergyman (pope) and the shape of the fair beard recalled her doctor (myself) while the stature of the man in the dream recalled her father. All these persons stand in the same relation to her: they are all guiding and directing the course of her life. On further questioning the golden eye recalled gold—money—the rather expensive psycho-analytic treatment, which gives her a great deal of concern. Gold, moreover, recalls the gold cure for alcoholism—Herr D whom she would have married, if it had not been for his clinging to the disgusting alcohol habit—she does not object to anyone's taking an occasional drink; she herself sometimes drinks beer and liqueurs. This again brings her back to her visit to San Paolo (*fuori la mura*) and its surroundings. She remembers that in the neighbouring monastery of the *Tre Fontane* she drank a liqueur made of *eucalyptus* by the Trappist monks of the monastery. She then relates how the monks transformed this malarial and swampy region into a dry and wholesome neighbourhood by planting numbers of eucalyptus trees. The word *uclamparia* then resolves itself into *eucalyptus* and *malaria* and the word *wet* refers to the former swampy nature of the locality. *Wet* also suggests dry. *Dry* is actually the name of the man whom she would have married but for his over indulgence in alcohol. The peculiar name of *Dry* is of Germanic origin (*drei*=three) and hence alludes to the monastery of the Three (*drei*) Fountains. In talking of Mr Dry's habit she used the strong expression "He could drink a

Given by translator as the author's example could not be translated.

lady who was examined by me and also in the same connection to my wife Further in the morbid chan es which I discover in her throat I have summarized allusions to quite a number of other persons

All these people whom I encounter as I fol low up the as ociations suggested by *Irma* do not appear personally in the dream they are concealed behind the dream person *Irma* who is thus developed into a collective image which as might be expected has contradictory features Irma comes to represent these other per ons who are discarded in the work of con densation inasmuch as I allow anything to happen to her which reminds me of these per sons trait by trait

For the purpo es of dream condensation I may construct a *composite person* in yet an other fashion by combining the actual features of two or more persons in a sin le dream im age It is in this fashion that the Dr M of my dream was constructed he bears the name of Dr M and he speaks and acts as Dr M does but his bodily characteristics and his malady belong to another person my eldest brother a single feature paleness is doubly deter mined owing to the fact that it is common to both persons Dr R in my dream about my uncle is a similar composite person But here the dream image is constructed in yet another fashion I have not united features peculiar to the one person with the features of the other thereby abridging by certain features the mem ory picture of each but I have adopted the method employed by Galton in producing fam ily portraits namely I have superimposed the two images so that the common features stand out in stronger relief while those which do not coincide neutralize one another and become indistinct In the dream of my uncle the *fair beard* stands out in relief as an emphasized fea ture from a physiognomy which belongs to two persons and which is consequently blurred further in its reference to growing grey the beard contains an allusion to my father and to myself

The construction of collective and composite persons is one of the principal methods of dream conden ation We shall presently have oc casion to deal with this in another connection

The notion of *dysentery* in the dream of Ir ma s injection has likewise a multiple determi nation on the one hand because of its para phasic assonance with diphtheria and on the other because of its reference to the patient whom I sent to the East and whose hysteria had been wrongly diagnosed

The mention of *propyls* in the dream proves again to be an interesting case of condensation Not *propyls* but *amyls* were included in the dream thoughts One mi ht think that here a simple di placement had occured in the co of dream formation This i in fact the case but the di placement erves the purposes of the condensation as is shown from the follow g supplementary analysis If I dwell for a mo ment upon the word *propylen* (German) its as sonance with the word *propylaeum* su ge ts it self to me But a *propylaeum* is to be found not only in Athens but also in Munich In the latter city a year before my dream I had vis ited a friend who was seriously ill and the ref erence to him in *trimethylamin* which follows clo ely upon *propyls* is unmistakable

I pass over the striking circumstance that here as elsewhere in the analy is of dreams as sociations of the mo t widely differing values are employed for making thought connections as thou h they were equivalent and I yield to the temptation to regard the procedure by which *amyls* in the dream thoughts are re placed in the dream content by *propyls* as a sort of plastic process

On the one hand here is the group of ideas relating to my friend Otto who does not un derstand me thinks I am in the wron and gives me the liqueur that smells of amyls on the other hand there is the group of ideas—connected with the first by contrast—relating to my Berlin friend who does understand me who would always think that I was right and to whom I am indebted for so much valuable in formation concerning the chemistry of sexual processes

What elements in the *Otto* group are to at tract my particular attention are determined by the recent circumstances which are re pon sible for the dream *amyls* belong to the ele ment so distinguished which are predestined to find their way into the dream content The large group of ideas centering upon *William* is actually stimulated by the contrast between William and Otto and those elements in it are emphasized which are in tune with tho e al ready stirred up in the *Otto* group In the whole of this dream I am continually recoiling from somebody who excites my displea ure towards another person with whom I can at will con front the first trait by trait I appeal to the friend as against the enemy Thus *amyls* in the *Otto* group awakes recollections in the other group also belonging to the region of chemis

Cherche la femme by which these thou hts m be summarized lead me if taken in an other sense t my brother who s still unmarried and whose n me is *Alexander* Now I see that *Alex* as we abbreviat the nam ounds almos like an in ersion of *Lasker* and that this fact must ha e co tributed to send my th ughts n a *détour* by way f Breslau

B t the playin with nam and syllables in which I m here enga ed has yet an ther mean m It represe ts th wish that m brother ma enjoy a happy family life and thus in the f d win manner I the novel of artistic life *L'Œuvre* which, by rt e of its co tent must have been in association with my dream thoughts the a th r well known has cidentall gi e descript o of his own person a d his own domestic happ ness a d ppears und the m of *S nd* In the meta m ph s of his name he p obably we t t ... beginning of the name Al xand r by th third syllabl of the me nam s d and thus r n ed t *S do* My o *todidaske* originated in a simil f hion

great aston hment he began to beg my pardon for ha ng lied to me he had felt so a hamed and now he revealed to me just that p ece of exual aetiology wh ch I had expected and which I found nece sary for assumin the n tence f a neu osis This was a relief to me but at the same time a humiliat on for I had to admit that my consultant who was not dis co certed by the ab ence of anamnesis had d ed th case more correctly I made up my mind to tell him when next I saw him that he had been right a d I had been wrong

This is just what I do in the dream But what ort of a w h is fulfilled if I acknowledge that I am m taken? This is preci ely my w h I wish to be mi taken as regards my fears—that is to say I wi h that my wife whose fe rs I ha e appropriated in my dream thou ht may p o e to be m taken. 4 Upon another occa ion I had a dream which consisted of two separate parts The first was the vividly remembered word *Autodidasker* the second was a faithful reproduction in the dream content of a short and harmless fancy which had been developed a few days earlier and which was to the effect that I must tell Professor N when I next saw him The patient about whose condition I last consulted you is really sufferin from a neurosis ju t as you suspected So not only must the newly coined *Autodidasker* satisfy the requirement that it should contain or represent a compressed meaning but this meaning must have a valid connection with my resolve—repea ed from waking life—to give Professor N due credit for his diagnosis

Now *Autodidasker* is easily separated into *author* (German *Autor*) *autodidact* and *Lasker* with whom is associated the nam *Lasalle* The first of these words leads to the occasion of the dream—which this time is significant I had brought home to my wife several volumes by a well known author who is a friend of my brother s and who as I have learned comes from the same neighbourhood as myself (J J David) One evening she told me how profoundly impressed she had been by the pathetic sadness of a story in one of David s novels (a story of wasted talents) and our conversation turned upon the signs of talent which we perceive in our own children Under the influence of what she had just read my wife expressed some concern about our children, and I comforted her with the remark that precisely such dangers as she feared can be averted by training During the night my thou hts proceeded farther took up my wife s concern for the children and interwove with it all sorts of other things Something which the noveli t had said to my brother on the subject of marriage showed my thoughts a by path which might lead to representation in the dream This path led to Breslau a lady who was a very good friend of ours had married and gone to live there I found in Breslau *Lasker* and *Lasalle* two examples to justify the fear lest our boys should be ruined by women examples which enabled me to represent simultaneously two ways of influencing a man to his undoing The

thoughts seems to have found its way into the dream-content and thus is unduly expanded. Again, in the dream of my uncle, the fair beard, which seems to be its central point, appears to have no rational connection with the desire for greatness which we have recognized as the nucleus of the dream-thoughts. Such dreams very naturally give us an impression of a displacement. In complete contrast to these examples the dream of Irma's injection shows that individual elements may claim the same place in dream formation as that which they occupy in the dream thoughts. The recognition of this new and utterly inconstant relation between the dream-thoughts and the dream-content will probably astonish us at first. If we find, in a psychic process of normal life, that one idea has been selected from among a number of others, and has acquired particular emphasis in our consciousness, we are wont to regard this as proof that a peculiar psychic value (a certain degree of interest) attaches to the victorious idea. We now discover that this value of the individual element in the dream-thoughts is not retained in dream formation, or is not taken into account. For there is no doubt which of the elements of the dream-thoughts are of the highest value; our judgment informs [illegible] on the essen

the dream by other elements which were certainly subordinate in the dream-thoughts. It seems at first as though the psychic intensity[1] of individual ideas were of no account in their selection for dream formation, but only their greater or lesser multiplicity of determination. One might be inclined to think that what gets into the dream is not what is important in the dream-thoughts but what is contained in them several times over; but our understanding of dream formation is not much advanced by this assumption; to begin with, we cannot believe that the two motives of multiple determination and intrinsic value can influence the selection of the dream otherwise than in the same direction. Those ideas in the dream-thoughts which are most important are probably also those which recur most frequently, since the individual dream-thoughts radiate from them as centres. And yet the dream may reject these intensely emphasized and extensively reinforced

elements and may take up in its content other elements which are only extensively reinforced.

This difficulty may be solved if we follow up yet another impression received during the investigation of the over-determination of the dream-content. Many readers of this investigation may already have decided, in their own minds, that the discovery of the multiple determination of the dream-elements is of no great importance, because it is inevitable. Since in analysis we proceed from the dream-elements and register all the ideas which associate themselves with these elements, is it any wonder that these elements should recur with peculiar frequency in the thought material obtained in this manner? While I cannot admit the validity of this objection, I am now going to say something that sounds rather like it. Among the thoughts which analysis brings to light are many which are far removed from the nucleus of the dream, and which stand out like artificial interpolations made for a definite purpose. Their purpose may readily be detected; they establish a connection, often a forced and far-fetched connection, between the dream-content and the dream-thoughts, and in many cases if these elements were weeded out of the analysis the components of the dream-content would not only not be over-determined, but they would not be sufficiently determined. We are thus led to the conclusion that multiple determination, decisive as regards the selection made by the dream, is perhaps not always a primary factor in dream formation, but is often a secondary product of a psychic force which is as yet unknown to us. Nevertheless it must be of importance for the entrance of the individual elements into the dream, for we may observe that, in cases where multiple determination does not proceed easily from the dream material, it is brought about with a certain effort.

It now becomes very probable that a psychic force expresses itself in the dream work which, on the one hand, strips the elements of the high psychic value of their intensity and, on the other hand, by means of over-determination, creates new significant values from elements of low value, which new values then make their way into the dream-content. Now if this is the method of procedure there has occurred in the process of dream formation a transference and displacement of the psychic intensities of the individual elements, from which results the textual difference between the

[1] The psychic intensity or value of an idea—the emphasis due to interest—is of course to be distinguished from perceptual or conceptual intensity.

thoughts since it touches so closely upon the anxiety subsequently expressed by my wife Thus even my fear that N may prove to be right in his remarks on the difficulties to be met with in bringing up boys is admitted into the dream content inasmuch as it is concealed behind the representation of my wish that I may be wrong to harbour such apprehensions The same phantasy serves without alteration to represent *both the conflicting alternatives*

Examination dreams present the same difficulties to interpretation that I have already described as characteristic of most typical dreams The associative material which the dreamer supplies only rarely suffices for interpretation A deeper understanding of such dreams has to be accumulated from a considerable number of examples Not long ago I arrived at a conviction that reassurances like But you already are a doctor and so on not only convey a consolation but imply a reproach as well This would have run You are already so old so far advanced in life and yet you still commit such follies are guilty of such childish behaviour This mixture of self criticism and consolation would correspond with the examination-dreams After this it is no longer surprising that the reproaches in the last analysed examples concerning *follies* and *childish behaviour* should relate to repetitions of reprehensible sexual acts

The verbal transformations in dreams are very similar to those which are known to occur in paranoia and which are observed also in hysteria and obsessions The linguistic tricks of children who at a certain age actually treat *words as objects and even invent new languages* and artificial syntaxes are a common source of such occurrences both in dreams and in the psychoneuroses

The analysis of nonsensical word formations in dreams is particularly well suited to demonstrate the degree of condensation effected in the dream work From the small number of the selected examples here considered it must not be concluded that such material is seldom observed or is at all exceptional It is on the contrary very *frequent* but owing to the dependence of dream interpretation on psychoanalytic treatment very few examples are noted down and reported and most of the analyses which are reported are comprehensible only to the specialist in neuropathology

When a spoken utterance expressly distinguished as such from a thought occurs in a dream it is an invariable rule that the dream speech has originated from a remembered speech in the dream material The wording of the speech has either been preserved in its entirety or has been slightly altered in expression frequently the dream speech is pieced together from different recollections of spoken remarks the wording has remained the same but the sense has perhaps become ambiguous or differs from the wording *Not infrequently* the dream speech serves merely as an allusion to an incident in connection with which the remembered speech was made

B *The Work of Displacement*

Another and probably no less significant relation must have already forced itself upon our attention while we were collecting examples of dream condensation We may have noticed that these elements which obtrude themselves in the dream content as its essential components do not by any means play this same part in the dream thoughts As a corollary to this the converse of this statement is also true That which is obviously the essential content of the *dream thoughts need not* be represented at all in the dream The dream is as it were *centred elsewhere* its content is arranged about elements which do not constitute the central point of the dream thoughts Thus for example in the dream of the botanical monograph the central point of the dream content is evidently the element *botanical* in the dream thoughts we are concerned with the complications and conflicts resulting from services rendered between colleagues which place them under mutual obligations later on with the reproach that I am in the habit of sacrificing too much time to my hobbies and the element *botanical* finds no place in this nucleus of the dream thoughts unless it is loosely connected with it by antithesis for botany was never among my favourite subjects In the Sappho dream of my patient ascending and descending being upstairs and down is made the central point the dream, however is concerned with the danger of sexual relations with persons of *low* degree so that only one of the elements of the dream

C *The Means of Representation in Dreams*

Besides the two factors of *condensation* and *displacement* in dreams which we have found to be at work in the transformation of the latent dream material into the manifest dream-content we shall in the course of this investigation come upon two further conditions which exercise an unquestionable influence over the selection of the material that eventually appears in the dream But first even at the risk of seeming to interrupt our pro ress I shall take a preliminary glance at the processes by which the interpretation of dreams is accomplished I do not deny that the best way of explaining them and of convincin the critic of their reliability would be to take a single dream as an example to detail its interpretation as I did (in Chapter II) in the case of the dream of Irma s injection but then to assemble the dream thou hts which I had discovered and from them to reconstruct the formation of the dream—that is to say to supplement dream analysis by dream synthesis I have done this with several pecimens for my own instruction but I cannot undertake to do it here as I am prevented by a number of considerations (relating to the psychic material necessary for such a demonstration) such as any right thinking person would approve In the analysis of dreams these considerations pre ent less difficulty for an analysis may be incomplete and still retain its value even if it lead only a little way into the structure of the dream I do not see how a synthesis to be convincing could be anything short of complete I could give a complete synthesis only of the dreams of such persons as are unknown to the reading public Since however neurotic patients are the only persons who furnish me with the means of making such a synthesis this part of the description of dreams must be postponed until I can carry the psychological explanation of the neuroses far enough to demonstrate their

relation to one another. This will be done elsewhere.[1]

From my attempts to construct dreams synthetically from their dream-thoughts, I know that the material which is yielded by interpretation varies in value. Part of it consists of the essential dream-thoughts, which would completely replace the dream and would in themselves be a sufficient substitute for it, were there no dream-censorship. To the other part, one is wont to ascribe slight importance. Nor does one set any value on the assertion that all these thoughts have participated in the formation of the dream; on the contrary, there may be among them notions which are associated with experiences that have occurred subsequently to the dream, between the dream and the interpretation. This part comprises not only all the connecting-paths which have led from the manifest to the latent dream-content, but also the intermediate and approximating associations by means of which one has arrived at a knowledge of these connecting-paths during the work of interpretation.

At this point we are interested exclusively in the essential dream-thoughts. These commonly reveal themselves as a complex of thoughts and memories of the most intricate possible construction, with all the characteristics of the thought-processes known to us in waking life. Not infrequently they are trains of thought which proceed from more than one centre, but which are not without points of contact; and almost invariably we find, along with a train of thought, its contradictory counterpart, connected with it by the association of contrast.

The individual parts of this complicated structure naturally stand in the most manifold logical relations to one another. They constitute foreground and background, digressions, illustrations, conditions, lines of argument and objections. When the whole mass of these dream-thoughts is subjected to the pressure of the dream-work, during which the fragments are turned about, broken up and compacted, somewhat like drifting ice, the question arises: What becomes of the logical ties which had hitherto provided the framework of the structure? What representation do [illegible] though, either-or and all the other conjunctions without which we cannot understand a phrase or a sentence in our dreams?

To begin with, we must answer that the dream has at its disposal no means of representing these logical relations between the dream-thoughts. In most cases it disregards all these conjunctions, and undertakes the elaboration only of the material content of the dream-thoughts. It is left to the interpretation of the dream to restore the coherence which the dream-work has destroyed.

If dreams lack the ability to express these relations, the psychical material of which they are wrought must be responsible for the fact. As a matter of fact, the representative arts— [illegible] of which the two plastic arts endeavour to express something. Before the art of painting arrived at an understanding of the laws of expression by which it is bound, it attempted to make up for this deficiency. In old paintings little labels hung out of the mouths of the persons represented, giving in writing the speech which the artist despaired of expressing in the picture.

Here, perhaps, an objection will be raised, challenging the assertion that our dreams dispense with the representation of logical relations. There are dreams in which the most complicated intellectual operations take place; arguments for and against are adduced, jokes and comparisons are made, just as in our waking thoughts. But here again appearances are deceptive; if the interpretation of such dreams is continued, it will be found that *all these things are dream-material, not the representation of intellectual activity in the dream*. The content of the dream-thoughts is reproduced by the apparent thinking in our dreams, but not the *relations of the dream-thoughts to one another*, in the determination of which relations thinking consists. I shall give some examples of this. But the fact which is most easily established is that all speeches which occur in dreams, and which are expressly designated as such, are unchanged or only slightly modified replicas of speeches which occur likewise among the memories in the dream-material. Often the speech is only an allusion to an event contained in the dream-thoughts; the meaning of the dream is quite different.

[1] I have since given the complete analysis and synthesis of two dreams in the *Bruchstück einer Hysterieanalyse* (1905) (*Ges. Schriften*, Vol. VIII). "Fragment of an Analysis of a Case of Hysteria," trans. by Strachey, *Collected Papers*, Vol. III (Hogarth Press, London). O. Rank's analysis, *Ein Traum, der sich selbst deutet*, deserves mention as the most complete interpretation of a comparatively long dream.

dream content and the thought content The process which we here assume to be operative is actually the most essential part of the dream work it may fitly be called *dream displacement Dream displacement and dream condensation* are the two craftsmen to whom we may chiefly ascribe the structure of the dream

I think it will be easy to reco nize the psychic force which expresses itself in dream displ ce ment The result of this displacement is that the dream content no longer has any likeness to the nucleus of the dream thoughts and the dream reproduces only a distorted form of the dream wish in the unconscious But we are already acquainted with dream distortion we have traced it back to the censorship which one psychic instance in the psychic life exercises over another Dream displacement is one of the chief means of achieving this distortion *Is fecit cui profuit* We must assume that dream displacement is brought about by the influence of this censorship the endopsychic defence

However I shall not dispute the fact that even critical thought activity which does not simply repeat material from the dream thought plays a part in dream formation I shall have to explain the influence of this factor at the close of this discussion It will then become clear that this thought activity is evoked not by the dream thoughts but by the dream itself after it is in a certain sense already completed

Provisionally then it is agreed that the logical relations between the dream thoughts do not obtain any particular representation in the dream For instance where there is a contradiction in the dream this is either a contradiction directed against the dream itself or a contradiction contained in one of the dream thoughts a contradiction in the dream corresponds with a contradiction *between* the dream thoughts only in the most indirect and intermediate fashion

But just as the art of painting finally succeeded in depicting in the persons represented at least the intentions behind their words—tenderness menace admonition and the like—by other means than by floating labels so also the dream has found it possible to render an account of certain of the logical relations between its dream thoughts by an appropriate modification of the peculiar method of dream representation It will be found by experience that different dreams go to different lengths in this respect while one dream will entirely disregard the logical structure of its material another attempts to indicate it as completely as possible In so doing the dream departs more or less widely from the text which it has to elaborate and its attitude is equally variable in respect to the temporal articulation of the dream thoughts if such has been established in the unconscious (as for example in the dream of Irma s injection)

But what are the means by which the dream work is enabled to indicate those relations in the dream material which are difficult to represent? I hall attempt to enumerate these one by one

In the first place the dream renders an account of the connection which is undeniably present between all the portions of the dream thoughts by combining this material into a unity as a situation or a proceeding It reproduces *logical connections* in the form of *simultaneity* in this case it behaves rather like the painter who groups together all the philosophers or poets in a picture of the School of Athens or Parnassus They never were assembled in any hall or on any mountain top although to the reflective mind they do constitute a community

The dream carries out in detail this mode of representation Whenever it shows two elements close together it vouches for a particularly intimate connection between their corresponding representatives in the dream thoughts. It is as in our method of writing *to* signifies that the two letters are to be pronounced as one syllable while *t* with *o* following a blank space indicates that *t* is the last letter of one word and *o* the first letter of another Consequently dream combinations are not made up of arbitrary completely incongruous elements of the dream material but of elements that are pretty intimately related in the dream thoughts also

For representing *causal relations* our dreams employ two methods which are essentially reducible to one The method of representation more frequently employed—in cases for example where the dream thoughts are to the effect Because this was thus and thus this and that must happen —consists in making the subordinate clause a prefatory dream and joining the principal clause on to it in the form of the main dream If my interpretation is correct, the sequence may likewise be reversed The principal clause always corresponds to that part of the dream which is elaborated in the greatest detail

An excellent example of such a representation of causality was once provided by a female patient whose dream I shall subsequently give in full The dream consisted of a short prologue and of a very circumstantial and very definitely centred dream composition I might entitle it Flowery language The preliminary dream is as follows *She goes to the two maids in the kitchen and scolds them for taking so long to prepare a little bite of food She also sees a very large number of heavy kitchen utensils in the kitchen turned upside down in order to drain even heaped up in stacks The two maids go to fetch water and have as it were to climb into a river which reaches up to the house or into the courtyard*

Then follows the main dream which begins as follows *She is cl mbing down from a height over a curiously shaped trellis and she is glad that her dress doesn t get caught anywhere etc* Now the preliminary dream refers to the house of the lady s parents The word which are spoken in the kitchen are words which she has probably often heard spoken by her mother

The pues of clumsy pots d pa.s re taken from an unre en ous hardware s op located m th same hou. The second part of the dream contains an allusion to the dreamer s f he wh was alwa s pes ering the ma d. a.d who during a flood—for the house ood close t th bank of t.. river—contracted I al Il ess The t ou w..ch is concealed be.. d the preliminary dream s someth... like th.. Because I was born in this house in such sord.d and unpleas e round ngs The main dream takes p the same thou ... and presents it in form that has been al tered by w.h-fulfilment I am of exal ed origin. Proverl then Because I am of such humb ...rigin, the course of my life has been so and so

As f ..s I can see, the divi on of a dream in two unequal portions does not alwa s s.. nif a causal rea on between the thoughts of the two portions It often seems as t.. ugh in th two dreams the same material were presen ed from d..erent point I ew t..s cer tainl the case when a series f dreams, dreamed the same n ..t, end in a seminal emission. the soma c need enforcing a m re and more defin e expression. You are requested to shut the / one eye(s)

Each of the two versions has its special meaning and leads along particular path in the dream interpretation I had made the simplest possible funeral arrangements for I knew what the deceased thought about such matters Other members of the family however did not approve of such puritanical simplicity they thought we should feel ashamed in the presence *of the other mourners Hence one of the word*ings of the dream asks for the *shutting of one eye* that is to say it asks that people should show consideration The significance of the vagueness which is here represented by an *either—or* is plainly to be seen The dream work has not succeeded in concocting a coherent and yet ambiguous wording for the dream thoughts Thus the two principal trains of thought are separated from each other even in the dream content

In some few cases the division of a dream into two equal parts expresses the alternative *which the dream finds it so difficult to present*

The attitude of dreams to the category of *antithesis* and *contradiction* is very striking This category is simply ignored the word *No* does not seem to exist for a dream Dreams are particularly fond of reducing antitheses to uniformity or representing them as one and the same thing Dreams likewise take the lib*erty of representing any element* whatever by its desired opposite so that it is at first impossible to tell in respect of any element which is capable of having an opposite whether it is contained in the dream thoughts in the nega*tive or the positive sense* In one of the recently cited dreams whose introductory portion we have already interpreted (because my origin *is so and so*) *the dreamer climbs down over* a trellis and holds a blossoming bough in her hands Since this picture suggests to her the angel in paintings of the Annunciation (her own name is Mary) bearing a lily stem in his hand and the white robed girl walking in procession on Corpus Christi Day when the streets are decorated with green boughs the *blossoming bough in the dream is quite clearly* an allusion to sexual innocence But the bough is thickly studded with red blossoms each of which resembles a camellia At the end of her walk (so the dream continues) the blossoms are already beginning to fall then follow unmistakable allusions to menstruation But the very bough which is carried like a lily stem and as though by an innocent girl *is also an* allusion to Camille who as we know usually wore a white camellia but a red one during menstruation The same blossoming bough (the flower of maidenhood in Goethe s songs of the miller s daughter) *represents* at once sexual innocence and its opposite Moreover the same dream which expresses the dreamer s joy at having succeeded in passing *through life* unsullied hints in several places (as in the falling of the blossom) at the opposite train of thought namely that she had been guilty of various sins against sexual purity (that is in her childhood) *In the analysis of* the dream we may clearly distinguish the two trains of thought of which the comforting one seems to be superficial and the reproachful one more profound The two are diametrically opposed to each other and their similar yet contrasting elements have been represented by identical dream elements

The *mechanism of dream formation* is favourable in the highest degree to only one of the logical relations This relation is that of similarity agreement contiguity *just as* a relation which may be represented in our *dreams as no other can be* by the most varied expedients The *screening* which occurs in the dream material or the cases of *just as* are the *chief points of support for dream formation* and a not inconsiderable part of the dream work consists in creating new *screenings* of this kind in cases where those that already exist are prevented by the resistance of the censorship from making their way into the dream The effort towards condensation evinced by *the dream work* facilitates the representation *of a relation of similarity*

Similarity agreement community are quite generally expressed in dreams by contraction *into a unity which is either already found in* the dream material or is newly created The first case may be referred to as *identification* the second as *composition* Identification is used where the dream is concerned with persons

[illegible footnote]

fied abstraction of disparate perceptual images.

Dreams naturally abound in such composite formations. I have given several examples of these in the dreams already analysed, and will now cite more such examples. In the dream on p. 3.. which describes the career of my patient in flowery language, the dream-ego carries a spray of blossoms in her hand which, as we have seen, signifies at once sexual innocence and sexual transgression. Moreover, from the manner in which the blossoms are set on they recall cherry blossoms; the blossoms themselves, considered singly, are *camellias*, and finally the whole spray gives the dreamer the impression of an *exotic plant*. The common feature in the elements of this composite formation is revealed by the dream-thoughts. The blossoming spray is made up of allusions to presents by which she was induced or was to have been induced to behave in a manner agreeable to the giver. So it was with cherries in her childhood, and with a camellia-tree in her later years; the exotic character is an allusion to a much-travelled naturalist who sought to win her favour by means of a drawing of a flower. Another female patient contrives a composite mean of *bathing-machines* at seaside resorts, country *privies*, and the *attics* of our city dwelling-houses. A reference to human nakedness and exposure is common to the first two elements; and we may infer from their connection with the third element that (in her childhood) the garret was likewise the scene of bodily exposure. A dreamer of the male sex makes a composite locality out of two places in which "treatment" is given—my office and the assembly rooms in which he first became acquainted with his wife. Another female patient, after her elder brother has promised to regale her with caviar, dreams that his legs are *covered all over with black beads of caviar*. The two elements, taint in a moral sense and the recollection of a cutaneous eruption in childhood which made her legs look as though studded over with red instead of black spots, have here combined with the beads of caviar to form a new idea—the idea of *"what she gets from her brother."* In this dream parts of the human body are treated as objects, as is usually the case in dreams. In one of the dreams recorded by Ferenczi there occurs a composite formation made up of the person of a *physician* and a *horse*, and this composite being wears a *nightshirt*. The common feature in these three components was revealed in the analysis, after the nightshirt had been recognized as an allusion to the father of the dreamer in a scene of childhood. In each of the three cases there was some object of her sexual curiosity. As a child she had often been taken by her nurse to the army stud, where she had the amplest opportunity to satisfy her curiosity, at that time still unsatisfied.

I have already stated that the dream has no means of expressing the relation of contradiction, contrast, negation. I shall now contradict this assertion for the first time. A certain number of cases of what may be summed up under the word "contrast" obtain representation, as we have seen, simply by means of identification—that is, when an exchange, a substitution, can be bound up with the contrast. Of this we have cited repeated examples. Certain other of the contrasts in the dream-thoughts, which perhaps come under the category of *"inverted, turned into the opposite,"* are represented in dreams in the following remarkable manner, which may almost be described as witty. The *"inversion"* does not itself make its way into the dream-content, but manifests its presence in the material by the fact that a part of the already formed dream-content which is, for other reasons, closely connected in context is—as it were subsequently—*inverted*. It is easier to illustrate this process than to describe it. In the beautiful Up and Down dream (pp. 255-6) the dream representation of ascending is an inversion of its prototype in the dream-thoughts; that is, of the introductory scene of Daudet's *Sapho*; in the dream climbing is difficult at first and easy later on, whereas in the novel it is easy at first, and later becomes more and more difficult. Again, *above* and *below* with reference to the dreamer's brother are reversed in the dream. This points to a relation of inversion or contrast between two parts of the material in the dream-thoughts, which indeed we found in them, for in the childish phantasy of the dreamer he is carried by his nurse, while in the novel, on the contrary, the hero carries his beloved. My dream of *Goethe's attack* on Herr M (to be cited later) likewise contains an inversion of this sort, which must be set right before the dream can be interpreted. In this dream Goethe attacks a young man, Herr M; the reality as contained in the dream-thoughts is that an eminent man, a friend of mine, has been attacked by an unknown young author. In the dream I reckon time from the date of Goethe's death; in reality the reckoning was made from the year in which the paralytic was born. The

changing of these persons this relation also is expressed in dreams by identification In the *dream of Irma s injection I wish to* exchange one patient for another—that is to say I wish this other person to be my patient as the former person has been the dream deals with this wish by showing me a person who is called Irma but who is examined in a position such as I have had occasion to see only the other person occupy In the dream about my uncle this substitution is made the centre of the dream I identify myself with the minister by judging and treating my colleagues as shabbily as he does

It has been my experience—and to this I have found no exception—that every dream treats of oneself Dreams are absolutely egoistic In cases where not *my ego* but only a stran e person occurs in the dream content I may safely assume that by means of identification my ego is concealed behind that person *I am permitted to supplement my ego* On other occasions when my ego appears in the dream the situation in which it is placed tells me that another person is concealing himself *by means of identification* behind the ego In this case I must be prepared to find that in the interpretation I should transfer something which is connected with this person—the hidden common feature—to myself There are also dreams in which my ego appears together with other persons who when the identification is resolved once more show themselves to be my ego Through these identifications I shall then have to connect with my ego certain ideas to which the censorship has objected I may also give my e o multiple representation in my dream either directly or by means of identification with other people By means of several such identifications an extraordinary amount of thought material may be condensed That one s ego should appear in the same dream several times or in different forms is fundamentally no more surprisin than that it should appear in conscious thinking many times and in different places or in different relations as for example in the sentence When *I* think what a healthy child *I* was

Still easier than in the case of persons is the re olution of identifications in the case of localities designated by their own names as here the disturbing influence of the all powerful ego is lacking In one of my dreams of Rome (p 218) the name of the place in which I find myself is *Rome* I am surpri ed however by a large number of German placards at a street corner This last is a wish fulfilment, which immediately suggests *Prague* the wish itself probably originated at a period of my youth when I was imbued with a German nationalistic spirit which today is quite subdued At the time of my dream I was looking forward to meeting a friend in *Prague* the identification of Rome with Prague is therefore explained by a desired common feature I would rather meet my friend in Rome than in Prague for the purpose of this meeting I should like to exchange Prague for Rome

The *possibility of creatin* composite formations is one of the chief causes of the fantastic character so common in dreams in that it introduces into the dream content elements which *could never have* been objects of perception The psychic process which occurs in the creation of composite formations is obviously the same as that which we employ in conceiving or figuring a dragon or a centaur *in our* waking senses The only difference is that in the fantastic creations of waking life the impression intended is itself the decisive factor while the composite formation *in the dream is* determined by a factor—the common feature in the dream thoughts—which is independent of its form Composite formations in dreams may be achieved in a great many different ways *In the* most artless of these methods only the properties of the one thing are represented and this representation is accompanied by a knowledge that they refer to another object also *A more* careful technique combines features of the o e object with those of the other in a new image while it makes skilful use of any really existing resemblances between the two objects *The new* creation may prove to be wholly absurd or even successful as a phantasy according as the material and the wit employed in constructing it may permit If the objects to be condensed into a unity are too incongruous the dream work is content with creating a composite formation with a comparatively distinct nucleus to which are attached more indefinite modifications *The unification* into one image has here been to some extent unsuccessful the two repre entations overlap one another and give rise to something like a contest between the visual images Similar representations m ght be obtained in a drawing if one were to attempt to give form to a uni

thought which influences the dream material reveals itself as my opposition to the treatment of Goethe as though he were a lunatic It is the other way about says the dream if you don t understand th book it is you who are feeble minded not the author All these dreams of inversion moreover seem to me to imply an allusion to the contemptuous phrase to turn one s back upon a person (German *einem die Kehrseite eigen* lit to show a person one s backside) cf the inversion in respect of the dreamer s brother in the Sappho dream It is further worth noting how frequently inversion is employed in precisely those dreams which are inspired by repres ed homo sexual impulses

Moreover inversion or transformation into the opposite is one of the most favoured and most versatile methods of representation which the dream work has at its disposal It serves in the first place to enable the wish fulfilment to prevail against a definite element of the dream thou hts If only it were the other way about! is often the best expres ion for the reaction of the ego against a disagreeable recollection But inversion becomes extraordinarily u eful in the service of the censorship for it effects in the material to be represented a degree of distortion which at first simply paralyses our understandin of the dream It is therefore always permissible if a dream stubbornly refu es to surrender its meanin to venture on the experimental inversion of definite portion of its manifest content Then not infrequ ntly everything becomes clear

Besides the inversion of content the temporal inversion must not be overlooked A frequent device of dream distortion consists in presenting the final issue of the event or the conclusion of the train of thought at the beginnin of the dream and appending at the end of the dream the premises of the conclusion or the causes of the event Anyone who forgets this technical device of dream distortion stands helpless before the problem of dream interpretation

In many cases indeed we di cover the meaning of the dream only when we have subjected the dream content to a multiple inversion in accordance with the different relatio s For example in the dream of a youn patient who is sufferin from obsessional neurosi the memory of the childish death wish directed a a dreaded father concealed it elf behind the followin words *His father scolds him bec use he co nes home so late* but the context of the psycho analytic treatment and th impres ons of the dreamer how that the entence must be read as follows *He is angry with his father* and further that his father always *came home too early* (i e too soon) He would have preferred that h s father should not come ho e at all which is identical with the wish (cf p 245) that his father would die As a little boy durin the prolon ed absence of his father the dreamer was guilty of a exual a gression against another child and was puni hed by the threat Just you wait until your father comes home!

If we should seek to trace th relations between the dream content and the dream thoughts a little farther we shall do thi best by making the dream itself our point of departure and asking ourselves What do certain formal characteristics of the dream presentation signify in relation to the dream thou hts? Fir t and foremost amon the formal characteristics which are bound to impress us in dreams are the differences in the sensory intensity of the sin le dream images and in the distinctness of various parts of the dream or of whole dreams as compared with one a other The difference in the intensity of individual dream ima es cover the whole gamut from a sharpness of definition which one is inclined—although without warrant—to rate more highly than that of reality to a provoking indi tinctness which we declare to be characteristic of dreams because it really is not wholly comparable to any of the degrees of indistinctness which we occasionally perceive in real objects Moreover we usually describe the impression which we receive of an indistinct object in a dream as *fleeting* while we think of the more distinct dream ima es as having been perceptible also for a longer period of time We must now ask ourselves by what conditions in the

[1] Josephus *A iqu ie f the Jew* book II, chap trans. by Wm. Whisto (David M Kay Phil delphia)

and lon sought theory of bisexuality and the wish fulfilling power of the dream was respon sible for the fact that this theory (which by *the way was not communicated in the dream*) appeared to be so lucid and flawless Thus what I believed to be a judgment as re ards the fin *ished dream* was a part and indeed *the most* essential part of the dream content Here the dream work reached out as it were into my first waking *thoughts and presented to me in* the form of a *judgment* of the dream that part of the dream material which it had failed to represent with precision in the dream I was once confronted with the exact counterpart of this case by a female patient who at first ab solutely declined to relate a dream which was necessary for the analysis because it was so hazy and confused and who finally declared after repeatedly protesting the inaccuracy of her description that it seemed to her that sev eral persons—herself her husband and her father—had occurred in the dream and that she had not known whether her hu band was *her father or who really was her father or* something of that sort Comparison of this dream with the ideas which occurred to the dreamer in the course of the sitting showed beyond a doubt that it dealt with the rather commonplace story of a maidservant who has to confess that she is expecting a child and hears doubts expressed as to who the father *really is* The obscurity manifested by this dream therefore was once more a portion of the dream exciting material A fragment of this *material was represented in the form* of the dream *The form of the dream or of dreaming is employed with astonishing frequency to rep resent the concealed content*

Glosses on the dream and seemingly harmless comments on it often serve in the most subtle manner to conceal—althou h of course they really betray—a part of what is dreamed As *for example* when the dreamer says *Here the dream was wiped out* and the analysis gives an infantile reminiscence of listening to someone cleaning himself after defecation Or another example which deserves to be recorded in de tail A young man has a very distinct dream reminding him of phantasies of his boyhood which have remained conscious He found him self in a hotel at a *seasonal resort* it was night he mistook the number of his room and entered a room in which an elderly lady and her two daughters were undre sing to go to bed He con tinues *Then there are some gaps in the dream* something is missing and at the end there was a man in the room who wanted to throw me out and with whom I had to s n gle He tries in vain to recall the content and *intention of the boyish phantasy to which the* dream obviously alluded But we finally beco e aware that the required content had already been given in his *remarks concerning* the in distinct part of the dream *The gaps* are the genital apertures of the women who are going *to bed Here something is missing* describes the principal characteristic of the female genitals In his young days he burned with curiosity to see the female genitals and was still inclined to adhere to the infantile sexual theory which at tributes a male organ to women

A very similar form was assumed in an anal ogous reminiscence of another dreamer He dreamed *I o* [illegible] *rant* place *the salon of a brothel where I see two or three women one in a chemise and drawers*

Analysis Fraulein K is the daughter of his *former employer* as he himself admits she was a sister substitute He rarely had the opportu nity of talking to her but they once had a con versation in which one recognized one s sex uality so to speak as though one were to say *I am a man and you are a woman* He had been only once to the above mentioned restaurant when he was accompanied by the sister of his *brother in law* a girl to whom he was quite in different On another occa ion he accompanied three ladies to the door of the restaurant *The ladies were his sister* his sister in law and the girl already mentioned He was perfectly indif *ferent to all three of them* but they all be longed to the *sister category* He had visited a brothel but rarely perhaps two or three times in his life

The interpretation is based on the *dark place* the *interruption* in the dream and informs us that on occasion but in fact only rarely ob sessed by his boyish curiosity he had inspected *the genitals of his sister a few years his junior* A few days later the misdemeanor indicated in the dream recurred to his conscious memory

All dreams of the same night belong in re spect of their content to the same whole their *division into several parts their grouping* and number are all full of meaning and may be re garded as pieces of information about the *latent* dream thoughts In the interpretation of dreams

Accomp [illegible] y g hyst [illegible] ympt m [illegible] m [illegible] hoe d p ofu d d p ess [illegible] we e the h f t bl [illegible] f th patie t

f the obliterated reality It may therefore be assumed that the part dreamed contains the representation of the reality the real memory while on the other hand the continued dream contains the representation of what the dreamer merely wishes. The inclusion of a certain content in a *dream within a dream* is, therefore equivalent to the wish that what has been characterized as a dream had never occurred. In other words when a particular incident is represented by the dream work in a dream, it signifies the strongest confirmation of the reality of the incident, the most emphatic *affirmation of it* The dream work utilizes the dream itself as a form of repudiation and thereby confirms the theory that a dream is a wish fulfilment.

D Regard for Representability

We have hitherto been concerned with investigating the manner in which our dreams represent the relations between the dream thoughts but we have often extended our inquiry to the further question as to what alterations the dream material itself undergoes for the purposes of dream formation. We now know that the dream material, after being stripped of a great many of its relations, is subjected to compression, while at the same time displacements of the intensity of its elements enforce a psychic transvaluation of this material The displacements which we have considered were shown to be substitutions of one particular idea for another in some way related to the original by its associations and the displacements were made to facilitate the condensation, inasmuch as in this manner instead of two elements a common mean between them found its way into the dream. So far no mention has been made of any other kind of displacement. But we learn from the analyses that displacement of another kind does occur and that it manifests itself in an *exchange of the verbal expression* for the thought in question In both cases we are dealing with displacement along a chain of associations but the same process takes place in different psychic spheres and the result of this displacement in the one case is that one element is replaced by another while in the other case an element exchanges its verbal shape for another

This second kind of displacement occurring in dream formation is not only of great theoretical interest but also peculiarly well fitted to explain the appearance of phantastic absurdity in which dreams disguise themselves Displacement usually occurs in such a way that a colourless and abstract expression of the dream thought is exchanged for one that is pictorial and concrete The advantage and along with it the purpose of this substitution is obvious Whatever is pictorial is *capable of representation* in dreams and can be fitted into a situation in which abstract expression would confront the dream representation with difficulties not unlike those which would arise if a political leading article had to be represented in an illustrated journal Not only the possibility of representation but also the interests of condensation and of the censorship may be furthered by this exchange Once the abstractly expressed and unserviceable dream-thought is translated into pictorial language those contacts and identities between this new expression and the rest of the dream material which are required by the dream work, and which it contrives whenever they are not available are more readily provided since every language *concrete terms owing to their* evolution are richer in associations than are abstract terms It may be imagined that a good part of the intermediate work in dream formation which seeks to reduce the separate dream thoughts to the tersest and most unified expression in the dream is effected in this manner by fitting paraphrases of the various thoughts The one thought whose mode of expression has perhaps been determined by other factors will therewith exert a distributive and selective influence on the expressions available for the others and it may even do this from the very start just as it would in the creative activity of a poet When a poem is to be written in rhymed couplets, the second rhyming line is bound by two conditions it must express the meaning allotted to it and its expression must permit of a rhyme with the first line The best poems are of course those in which one does not detect the effort to find a rhyme and in which both thoughts have as a matter of course by mutual induction selected the verbal expression which with a little subsequent adjustment will permit of the rhyme

In some cases the change of expression serves the purposes of dream-condensation more directly in that it provides an arrangement of words which being ambiguous permits of the expression of more than one of the dream thoughts The whole range of verbal wit is thus made to serve the purpose of the dream work. The part played by words in dream formation ought not to surprise us A word, as the point

sort of purpose for representation and is evoked only when the need of this representation is present in the dream material

Inability to do a thing does not always appear in the dream as a sensation it may appear simply as part of the dream content I think one case of this kind is especially fitted to enlighten us as to the meaning of this peculiarity I shall give an abridged version of a dream in which I seem to be accused of dishonesty *The scene is a mixture made up of a private sanatorium and several other places A manservant appears to summon me to an inquiry I know in the dream that something has been missed and that the inquiry is taking place because I am suspected of having appropriated the lost article Analysis shows that inquiry is to be taken in two senses it includes the meaning of medical examination Being conscious of my innocence and my position as consultant in this sanatorium I calmly follow the manservant We are received at the door by another manservant who says pointing at me Have you brought him? Why he is a respectable man Thereupon and unattended I enter a great hall where there are many machines which reminds me of an inferno with its hellish instruments of punishment I see a colleague strapped to an appliance he has every reason to be interested in my appearance but he takes no notice of me I understand that I may now go Then I cannot find my hat and cannot go after all*

The wish that the dream fulfils is obviously the wish that my honesty shall be acknowledged and that I may be permitted to go there must therefore be all sorts of material in the dream thoughts which comprise a contradiction of this wish The fact that I may go is the *sign of my absolution* if then the dream provides at its close an event which prevents me from going we may readily conclude that the suppressed material of the contradiction is asserting itself in this feature The fact that I cannot find my hat therefore means You are not after all an honest man The inability to do something in the dream is *the expression of a contradiction a No* so that our earlier assertion to the effect that the dream is not capable of expressing a negation must be revised accordingly

In other dreams in which the inability to do something occurs not merely as a situation but also as a sensation the *same contradiction* is more emphatically expressed by the [illegible] of inhibited movement or a will to which a counter will is opposed Thus the sensation of inhibited movement represents a *conflict of will* We shall see later on that this very motor paralysis during sleep is one of the fundamental *conditions of the psychic process* which functions during dreaming Now an impulse which is conveyed to the motor system is no other than the will and the fact that we are certain that the impulse will be inhibited in sleep makes the whole process extraordinarily well adapted to the representation of a [illegible] *towards something and of a No which opposes* itself thereto From my explanation of anxiety it is easy to understand why the sensation of the inhibited will is so closely allied to anxiety and why it is so often connected with it in dreams Anxiety is a libidinal impulse which emanates from the unconscious and is inhibited *by the preconscious* Therefore when a sensation of inhibition in the dream is accompanied by anxiety the dream must be concerned with a volition which was at one time capable of arousing libido there must be a sexual impulse

As for the judgment which is often expressed during a dream Of course it is only a dream and the psychic force to which it may be ascribed I shall discuss these questions later on *For the present I will merely say that they are* intended to depreciate the importance of what is being dreamed The interesting problem allied to this as to what is meant if a certain content in the dream is characterized in the dream itself as having been dreamed—the riddle of a *dream within a dream*—has been solved in a similar sense by W Stekel by the analysis of some convincing examples Here *again the part of the dream dreamed is to be* depreciated in value and robbed of its reality that which the dreamer continues *to dream* after waking from the *dream within a dream* is what the dream wish desires to put in *place*

[illegible] to the [illegible] with [illegible] little M[illegible] [illegible] I cannot find my hat [illegible] Goethe [illegible]

This theory is [illegible] with [illegible] view

of the obliterated reality. It may therefore be assumed that the part dreamed continues the representation of the reality, the real memory, while, on the other hand, the continued dream contains the representation of what the dreamer merely wishes. The inclusion of a certain content in a *dream within a dream* is therefore equivalent to the wish that what has been characterized as a dream had never occurred. In other words: when a particular incident is represented by the dream-work in a dream, it signifies the strongest confirmation of the reality of this incident, the most emphatic *affirmation* of it. The dream-work utilizes the dream itself as a form of repudiation, and thereby confirms the theory that a dream is a wish-fulfilment.

D. Regard for Representability

We have hitherto been concerned with investigating the manner in which our dreams represent the relations between the dream-thoughts, but we have often extended our inquiry to the further question as to what alterations the dream-material itself undergoes for the purposes of dream-formation. We now know that the dream-material, after being stripped of a great many of its relations, is subjected to compression, while at the same time displacements of the intensity of its elements enforce a psychic transvaluation of this material. The displacements which we have considered were shown to be substitutions of one particular idea for another, in some way related to the original by its associations, and the displacements were made to facilitate the condensation, inasmuch as in this manner, instead of two elements, a common mean between them found its way into the dream. So far no mention has been made of any other kind of displacement. But we learn from the analyses that displacement of another kind does occur, and that it manifests itself in an exchange of the verbal expression for the thought in question. In both cases we are dealing with displacement along a chain of associations, but the same process takes place in different psychic spheres, and the result of this displacement in the one case is that one element is replaced by another, while in the other case an element exchanges its verbal shape for another.

This second kind of displacement occurring in dream-formation is not only of great theoretical interest, but is also peculiarly well-fitted to explain the appearance of fantastic absurdity in which dreams disguise themselves. Displacement usually occurs in such a way that a colourless and abstract expression of the dream-thought is exchanged for one that is pictorial and concrete. The advantage, and along with it the purpose, of this substitution is obvious. Whatever is pictorial is capable of representation in dreams [illegible] which would arise if a political leading article had to be represented in an illustrated journal. Not only the possibility of representation, but also the interests of condensation and of the censorship, may be furthered by this exchange. Once the abstractly expressed and unwieldy dream-thought is translated into pictorial language, those contacts and identities between this new expression and the rest of the dream-material which are required by the dream-work, and which it contrives whenever they are not available, are more readily provided, since in every language concrete terms, owing to their evolution, are richer in associations than are abstract terms. It may be imagined that a good part of the intermediate work in dream-formation, which seeks to reduce the separate dream-thoughts to the tersest and most uniform expression in the dream, is effected in this manner, by fitting paraphrases of the various thoughts. The one thought whose mode of expression has perhaps been determined by other factors will therewith exert a distributive and selective influence on the expressions available for the others, and it may even do this from the very start, just as it would in the creative activity of a poet. When a poem is to be written in rhymed couplets, the second rhyming line is bound by two conditions: it must express the meaning allotted to it, and its expression must permit of a rhyme with the first line. The best poems are, of course, those in which we do not detect the effort to find a rhyme, and in which both thoughts have, by mutual induction, selected the verbal expression which, with a little subsequent adjustment, will permit of the rhyme.

In some cases the change of expression serves the purposes of dream-condensation more directly, in that it provides an arrangement of words which, being ambiguous, permits of the expression of more than one of the dream-thoughts. The whole range of verbal wit is thus made to serve the purpose of the dream-work. The part played by words in dream-formation ought not to surprise us. A word, as the point

sort of purpose for representation and is evoked only when the need of this representation is present in the dream material

Inability to do a thing does not always appear in the dream as a sensation it may appear simply as part of the dream content I think one case of this kind is especially fitted to enlighten us as to the meaning of this peculiarity I shall give an abridged version of a dream in which I seem to be accused of dishonesty *The scene is a mixture made up of a private sanatorium and several other places A manservant appears to summon me to an inquiry I know in the dream t at something has been missed and that the inquiry is taking place because I am suspected of having appropriated the lost article Analysis shows that inquiry is to be taken in two senses it includes the meaning of medical examination Being conscious of my innocence and my position as consultant in this sanatorium I calmly follow the manservant We are received at the door by another man servant who says pointing at me Have you brought him? Why he is a respectable man Thereupon and unattended I enter a great hall where there are many machines which reminds me of an inferno with its hellish instruments of punishment I see a colleague strapped to an appliance he has every reason to be interested in my appearance but he takes no notice of me I understand that I may now go Then I cannot find my hat and cannot go after all*

The wish that the dream fulfils is obviou ly the wish that my honesty shall be acknowledged and that I may be permitted to go there must therefore be all sorts of material in the dream thoughts which comprise a contradiction of this wish The fact that I may go is the sign of my absolution if then the dream provides at its close an event which prevents me from going we may readily conclude that the suppres ed material of the contradiction is asserting itself in this feature The fact that I cannot find my hat therefore means You are not after all an honest man The inability to do somethin in the dream is *tl e express on of a contradiction a No* so that our earlier a sertion to the effect that the dream is not capable of expressing a ne ation mu t be revised accordingly

In other dreams in which the inability to do something occurs not merely as a situat on but also as a sensation the same contradiction is more emphatically expressed by the sen ation of inhibited movement or a will to which a counter will is opposed Thus the sensation of inhibited movement represents a *conflict of will* We shall see later on that this very motor paralysis during sleep is one of the fundamental conditions of the psychic process which functions during dreaming Now an impulse which is conveyed to the motor system is none other than the will and the fact that we are certain that the impulse will be inhibited in sleep makes the whole process extraordinarily well adapted to the representation of a *will* towards something and of a *No* which oppo es itself thereto From my explanation of anxiety it is easy to understand why the sensation of the inhibited will is so closely allied to anxiety and why it is so often connected with it in dreams Anxiety is a libidinal impulse which emanates from the unconscious and is inhibited by the preconscious Therefore when a sensation of inhibition in the dream is accompanied by anxiety the dream must be concerned with a volition which was at one tim [illegible]

[illegible]

[illegible] I shall discuss these questions later on For the present I will merely say that they a e intended to depreciate the importance of what is being dreamed The interesting problem allied to this as to what is meant if a certain content in the dream is characterized in the dream itself as having been dreamed—the riddle of a *dream with n a d eam*—has been solved in a similar sense by W Stekel by the analysis of some convincing examples Here again the part of the dream dreamed is to be depreciated in value and robbed of its reality that which the dreamer continues to dream after wakin from the *dream within a d eam* is what the dream wish desires to put in place

A [illegible] to [illegible] of childhood [illegible] in th [illegible] lys [illegible] th [illegible]

[illegible] the w ld w th [illegible] that my [illegible] d th t I was [illegible] The [illegible] t that I ca t fi d my hat [illegible] of the [illegible] d y wh h ha b [illegible] serv t [illegible] h dd [illegible] d th [illegible] I h [illegible] my d ty [illegible] I ca [illegible] y t [illegible] D th [illegible] d d th t g th —a [illegible] th d [illegible] G th [illegible] d the p [illegible] lyti [illegible] wh h was [illegible] d t

Th [illegible] th ry i [illegible] d [illegible] ce w th m [illegible] view

of the contested reality. It may therefore be assumed that the part dreamed contains the representation of the reality, the real memory, while on the other hand the continued dream contains the representation of what the dreamer merely wishes. The inclusion of a certain content in a "dream within a dream" is therefore equivalent to the wish that what has been characterized as a dream had never occurred. In other words, when a particular incident is represented by the dream-work in a dream, it signifies the strongest confirmation of the reality of this incident, the most emphatic *affirmation of it*. The dream-work utilizes the dream itself as a form of repudiation, and thereby confirms the theory that a dream is a wish-fulfilment.

D. Regard for Representability

We have hitherto been concerned with investigating the manner in which our dreams represent the relations between the dream-thoughts, but we have often extended our inquiry to the further question as to what alterations the dream-material itself undergoes for the purposes of dream-formation. We now know that the dream-material, after being stripped of a great many of its relations, is subjected to compression, while at the same time displacements of the intensity of its elements enforce a psychical transvaluation of this material. The displacements which we have considered were shown to be substitutions of one particular idea for another, in some way related to the original by its associations, and the displacements were made to facilitate the condensation, inasmuch as in this manner, instead of two elements, a common mean between them found its way into the dream. So far, no mention has been made of any other kind of displacement. But we learn from the analyses that displacement of another kind does occur, and that it manifests itself in an *exchange of the verbal expression* for the thought in question. In both cases we are dealing with displacement along a chain of associations, but the same process takes place in different psychic spheres, and the result of this displacement in the one case is that one element is replaced by another, while in the other case an element exchanges its verbal shape for another.

This second kind of displacement occurring in dream-formation is not only of great theoretical interest, but is also peculiarly well-fitted to explain the appearance of phantastic absurdity in which dreams disguise themselves. Displacement usually occurs in such a way that a colourless and abstract expression of the dream-thought is exchanged for one that is pictorial and concrete. The advantage, and along with it the purpose, of this substitution is obvious. Whatever is

also the interests of condensation and of the censorship may be furthered by this exchange. Once the abstractly expressed and unserviceable dream-thought is translated into pictorial language, those contacts and identities between this new expression and the rest of the dream-material which are required by the dream-work, and which it contrives whenever they are not available, are more readily provided, since in every language concrete terms, owing to their evolution, are richer in associations than are abstract terms. It may be imagined that a good part of the intermediate work in dream-formation, which seeks to reduce the separate dream-thoughts to the tersest and most unified expression in the dream, is effected in this manner, by fitting paraphrases of the various thoughts. The one thought whose mode of expression has perhaps been determined by other factors will then exert a distributive and selective influence on the expressions available for the others, and it may even do this from the very start, just as it would in the creative activity of a poet. When a poem is to be written in rhymed couplets, the second rhyming line is bound by two conditions: it must express the meaning allotted to it, and its expression must permit of a rhyme with the first line. The best poems are, of course, those in which one does not detect the effort to find a rhyme, and in which both thoughts have as a matter of course, by mutual induction, selected the verbal expression which, with a little subsequent adjustment, will permit of the rhyme.

In some cases the change of expression serves the purposes of dream-condensation more directly, in that it provides an arrangement of words which, being ambiguous, permits of the expression of more than one of the dream-thoughts. The whole range of verbal wit is thus made to serve the purpose of the dream-work. The part played by words in dream-formation ought not to surprise us. A word, as the point

of junction of a number of ideas pos esses as it were a predestined ambiguity and the neu roses (obsessions phobias) take advantage of the opportunities for condensation and disguise afforded by words quite as eagerly as do dreams That dream distortion also profits by this displacement of expression may be readily demonstrated It is indeed confusing if one am biguous word is substituted for two with single meanings and the replacement of sober every day language by a plastic mode of expression baffles our understandin especially since a dream never tells us whether the elements presented by it are to be interpreted literally or metaphorically whether they refer to the dream material directly or only by means of interpolated expressions Generally speaking in the interpretation of any element of a dream it is doubtful whether it

(*a*) is to be accepted in the negative or the positive sense (contrast relation)
(*b*) is to be interpreted historically (as a memory)
(*c*) is symbolic or whether
(*d*) its valuation is to be based upon its wording

In spite of this versatility we may say that the representation effected by the dream work *which was never even intended to be under stood* does not impose upon the translator any greater difficulties than those that the ancient writers of hieroglyphics imposed upon their readers

I have already given several examples of dream representations which are held together only by ambiguity of expression (*her mouth opens without difficulty* in the dream of Irma s injection *I cannot go yet after all* in the last dream related etc) I shall now cite a dream in the analysis of which plastic representation of the abstract thoughts plays a greater part The difference between such dream interpreta tion and the interpretation by means of symbols may nevertheless be clearly defined in the symbolic interpretation of dreams the key to the symbolism is selected arbitrarily by the interpreter while in our own cases of verbal dis guise these keys are universally known and are taken from established modes of speech Pro vided one hits on the ri ht idea on the right occasion one may solve dreams of this kind either completely or in part independently of any statements made by the dreamer

A lady a friend of mine dreams *She is at the opera It is a Wagnerian performance which has lasted until 7 45 in the morning In the stalls and pit there are tables at hich people are eating and drinking Her cousin and his young wife who have just returned from their honeymoon are sitting at one of these tables beside them is a member of the aristoc racy The young wife is said to have brought him back with her from the honeymoon quite openly just as she might have brought back a hat In the middle of the stalls there is a high tower on the top of which there is a platform surrounded by an iron railing There high over head stands the conductor with the features of Hans Richter continually running round behind the railing perspiring terribly and from this position he is conducting the orchestra wh ch is arranged round the base of the tower She herself is sitting in a box with a friend of her own sex* (known to me) *Her youn er sister tries to hand her up from the stalls a large lump of coal alleging that she had not known that it would be so long and that she must by this time be miserably cold (As though the boxes ought to have been heated during the long performance)*

Although in other respects the dream gives a good picture of the situation it is of course nonsensical enough the tower in the middle of the stalls from which the conductor leads the orchestra and above all the coal which her sister hands up to her I purposely asked for no analysis of this dream With some knowl edge of the personal relations of the dreamer I was able to interpret parts of it independent ly of her I knew that she had felt intense sym pathy for a musician whose career had been prematurely brou ht to an end by insanity I therefore decided to take the tower in the stalls *verbally* It then emerged that the man whom she wished to ee in the place of Hans Richter *towe ed* above all the other members of the orchestra This tower must be described as a *composite format on by means of apposition* by its substructure it represents the greatness of the man but by the railing at the top be hind which he runs round like a prisoner or an animal in a cage (an allusion to the name of the unfortunate man) it represents his later fate *Luna ic tower* is perhaps the expression in which the two thou hts might have met

Now that we have discovered the dream s method of representation we may try with

find disguises of this sort used with extreme frequency in the representation of the dream thoughts Only in the case of a few types of material has a generally valid dream symbolism established itself on the basis of generally known allusions and verbal equivalents A good part of this symbolism however is common to the psychoneuro es legends and popular usages as well as to dreams

In fact if we look more closely into the matter we must recognize that in employing this kind of substitution the dream work is doing nothing at all original For the achievement of its purpose which in this ca e is representation without interference from the censorship it simply follows the paths which it finds already marked out in unconscious thinking and gives the preference to those transformations of the repressed material which are permitted to become conscious also in the form of witticisms and allusions and with which all the phantasies of neurotics are replete Here we suddenly begin to understand the dream interpretations of Scherner whose essential correctness I have vindicated elsewhere The preoccupation of the imagination with one s own body is by no means peculiar to or characteristic of the dream alone My analyses have shown me that it is constantly found in the unconscious thinkin of neurotics and may be traced back to sexual curiosity whose object in the adoles cent youth or maiden is the genitals of the opposite sex or even of the same sex But as Scherner and Volkelt very truly insist the house does not constitute the only group of ideas which is employed for the symbolization of the body either in dreams or in the unconscious phantasies of neurosis To be sure I know patients who have steadily adhered to an architectural symbolism for the body and the genitals (sexual interest of course extends far beyond the re ion of the external genital organs)—patients for whom posts and pillars signify legs (as in the *Song of Songs*) to whom every door suggests a bodily aperture (hole) and every water pipe the urinary system and so on But the groups of ideas appertaining to plant life or to the kitchen are just as often cho en to conceal sexual images in respect of the former everyday language the sediment of ima inative comparisons dating from the remotest times has abundantly paved the way (the *vineyard* of the Lord the *seed* of Abraham the *garden* of the maiden in the *Song of Songs*) The ugliest as well as the most intimate details of exual life may be thought or dreamed of in apparently innocent allusions to culinary operations and the symptoms of hysteria will become absolutely unintelligible if we forget that exual symbolism may conceal itself behind the most commonplace and inconspicuous matters as its safest hiding place That some neurotic children cannot look at blood and raw meat that they vomit at the si ht of eggs and macaroni and that the dread of snakes which is natural to mankind is monstrously exaggerated in neurotics—all this has a definite sexual meaning Wherever th

v u u y veiled existence our idiomatic expressions proverbs uperstitions and customs testify to this day

I here insert the promised *flower dream* of a female patient in which I shall print in Roman type everything which is to be sexually in er preted This beautiful dream lost all its charm for the dreamer once it had been interpreted

(*a*) Preliminary dream *She goes to the two maids in the kitchen and scolds them for taking so long to prepare a little bite of food She also sees a very large number of heavy kitchen utensils in the kitchen heaped into piles and turned upside down in order to drain* Later addition *The two maids go to fetch water and have as it were to climb into a ri r which reac es up to the house or into the courtyard*

(*b*) Main dream *She is descending from a height over curiously constructed ra lings or a fence which is composed of large square trellis work hurdles with small square apertures It is really not adapted for climbing she is constantly afraid that she cannot find a place for her foot and she is glad that her dress doesn t get caught anywhere and that she is able to climb it so resp ctably As she climbs*

The progressive experience of psycho analysis has enabled us to discove n

uucu from dementia praecox so that for a time there was an inclination to suspect that all dreamers with such an understanding of symbols were suffering from that disorder But this did not prove to be the case it is simply a question of a personal gift or idiosyncrasy without perceptible pathological significance

When one has familiarized oneself w th h extens ve m

ua c not a permanently established meaning like the signs in shorthand and one even thinks of attempting to compile a new dream book on the lines of the cipher method In this connection it should be noted that symbolism does not appertain especially to dreams but rather to the unconscious imagination and particularly to that of the people and it is to be found in a more developed condition in folklore myths legends idiomatic phrases proverbs and the current witticisms of a people than in dreams We should have therefore to go far beyond the province of dream interpretation in order fully to investigate the meaning of symbolism and to discuss the numerous problems—for the most part still unsolved—which are associated with the concept of the symbol We shall here confine ourselves to saying that representation by a symbol comes under the heading of the indirect representations but that we are warned by all sorts of signs against indiscriminately classing symbolic representation with the other modes of indirect representation before we have clearly conceived its distinguishing characteristics In a number of cases the common quality shared by the symbol and the thing which it represents is obvious in others it is concealed in these latter cases the choice of the symbol appears to be enigmatic And the e are the very cases that must be able to elucidate the ultimate meaning of the symbolic relation they point to the fact that it is of a genetic nature What is today symbolically connected was probably united, in primitive times by conceptual and linguistic identity The symbolic relationship seems to be a residue and reminder of a former identity It may also be noted that in many ca es the symbolic identity extends beyond the linguistic identity as had already been asserted by Schubert (1814)

Dreams employ this symbolism to give a disguised representation to their latent thoughts Among the symbols thus employed there are of course many which constantly or all but constantly mean the same thin But we mu t bear in mind the curious plasticity of psychic material Often enou h a symbol in the dream content may have to be interpreted not symbolically but in accordance with its proper meaning at other times the dreamer having to deal with special memory material may take the law into his own hands and employ anything whatever as a sexual symbol though it is not generally so employed Wherever he has the choice of several symbols for the representation of a dream content he will decide in favour of that symbol which is in addition objectively related to his other thought material that is to say he will employ an individual motivation besides the typically valid one

Although since Scherner s time the more recent investigations of dream problems have definitely established the existence of dream symbolism—e n U our dream must yet uue existence of symbols in dreams has not only facilitated dream interpretation but has also made it more d fficult The technique of interpretation in accordance with the dreamer s free associations more often than otherwise leaves us in the lurch as far as the symbolic elements of the dream content are concerned A return to the arbitrariness of dream interpretation as it was

practised in antiquity and is seemingly revived by Stekel's wild interpretations, is contrary to scientific method. Consequently those elements in the dream-content which are to be symbolically regarded compel us to employ a combined technique, which on the one hand is based on the dreamer's associations, while on the other hand the missing portions have to be supplied by the interpreter's understanding of the symbols. Critical circumspection in the solution of the symbols must coincide with careful study of the symbols in especially transparent examples of dreams in order to silence the reproach of arbitrariness in dream interpretation. The uncertainties which still adhere to our function as dream interpreters are due partly to our imperfect knowledge (which, however can be progressively increased) and partly to certain peculiarities of the dream-symbols themselves. These often possess many and varied meanings, so that, as in Chinese script, only the context can furnish the correct meaning. This multiple significance of the symbol is allied to the dream's faculty of admitting over-interpretations, of representing in the same content, various wish-impulses and thought-formations, often of a widely divergent character.

After these limitations and reservations I will proceed. The Emperor and the Empress (King and Queen) in most cases really represent the dreamer's parents; the dreamer himself or herself is the prince or princess. But the high authority conceded to the Emperor is also conceded to great men, so that in some dreams, for example, Goethe appears as a father symbol (Hitschmann).—All elongated objects, sticks, tree-trunks, umbrellas (on account of the opening, which might be likened to an erection) all sharp and elongated weapons, knives, daggers, and pikes, represent the male member. A frequent, but not very intelligible symbol for the same is a nail-file (a reference to rubbing and scraping?).—Small boxes, chests, cupboards, and ovens correspond to the female organ; also cavities, ships, and all kinds of vessels.—A room in a dream generally represents a woman; the description of its various entrances and exits is scarcely calculated to make us doubt this interpretation. The interest as to whether the room is open or locked will be readily understood in this connection. (Cf. Dora's dream in *Fragment of an Analysis of Hysteria*.) There is no need to be explicit as to the sort of key that will unlock the room; the symbolism of lock and key has been gracefully if broadly employed by Uhland in his song of the *Graf Eberstein*.—The dream of walking through a suite of rooms signifies a brothel or a harem. But, as H. Sachs has shown by an admirable example, it is also employed to represent marriage (contrast). An interesting relation to the sexual investigations of childhood emerges when the dreamer dreams of two rooms which were previously one, or finds that a familiar room in a house of which he dreams has been divided into two, or the reverse. In childhood the female genitals and anus (the behind) are conceived of as a single opening according to the infantile cloaca theory, and only later is it discovered that this region of the body contains two separate cavities and openings. Steep inclines, ladders and stairs, and going up or down them, are symbolic representations of the sexual act. Smooth walls over which one climbs, façades of houses, across which one lets oneself down—often with a sense of great anxiety—correspond to erect human bodies, and probably repeat in our dreams childish memories of climbing up parents or nurses. *Smooth* walls are men; in anxiety dreams one often holds firmly to *projections* on houses. Tables, whether bare or covered, and boards, are women, perhaps by virtue of contrast, since they have no protruding contours. Wood, generally speaking, seems, in accordance with its linguistic relations, to represent feminine matter (*Materie*). The name of the island Madeira means wood in Portuguese. Since bed and board (*mensa et thorus*) constitute marriage, in dreams the latter is often substituted for the former, and as far as practicable the sexual representation-complex is transposed to the eating-complex.—Of ar-

In the U.S.A. the father is represented in dreams as the President, and even more often as the Governor—a title which is frequently applied to the parent in everyday life.—Tr.

A patient living in a boarding-house dreams that he meets one of the servants, and asks her what her number is; to his surprise she answers: 14. He has, in fact, entered into relations with the girl in question, and has often had her in his bedroom. He feared, as may be imagined, that the landlady suspected her, and had proposed, on the day before the dream, that they should meet in one of the unoccupied rooms. In reality this room had the number 14, while in the dream the woman bore this number. A clearer proof of the identification of woman and room could hardly be imagined. (Ernest Jones, *Intern. Zeitschr. f. Psychoanal.* ii, [...]) (Cf. Artemidorus, *The Symbolism* [...] (German version by F. S. Krauss, Vienna, [...] p. [...]) "Thus, for example, the bedroom signifies the wife, supposing one to be in the house.")

Cf. "the cloacal theory" in *Three Contributions to the Theory of Sex*. See p. [...] above.

ticles of dress a woman s hat may very often be interpreted with certainty as the male genitals In the dreams of men one often finds the neck tie as a symbol for the penis this is not only because neckties han down in front of the body and are characteristic of men but al o because one can select them at pleasure a freedom which nature prohibits as regards the original of the symbol Persons who make use of this symbol in dreams are very extravagant in the matter of ties and possess whole collec tions of them All complicated machines and appliances are very probably the genitals—as a rule the male genitals—in the description of which the symbolism of dreams is as indefati gable as human wit It is quite unmistakable that all weapons and tools are used as symbols for the male organ e g ploughshare hammer gun revolver dagger sword etc Again many of the landscapes seen in dreams especially those that contain bridges or wooded mountains may be readily recognized as descriptions of the genitals Marcinowski collected a series of examples in which the dreamer explained his dream by means of drawings in order to repre- sent the landscapes and places appearing in it These drawings clearly showed the distinction between the manifest and the latent meaning of the dream Whereas naively regarded they seemed to represent plans maps and so forth closer investigation showed that they were rep resentations of the human body of the geni tals etc and only after conceiving them thus could the dream be understood Finally where one finds incomprehensible neologisms one may suspect combinations of components having a sexual significance —Children too often *signify the genitals since men and women are* in the habit of fondly referring to their genital organs as *little man little woman little thing* The *l ttle b other* was correctly recognized by Stekel as the penis To play with or to beat a little child is often the dream s representation of masturbation The dream work represents castration by baldness hair cutting the loss of teeth and beheading As an insurance against castration the dream uses one of the common symbols of the penis in double o multiple form and the appearance in dream of a li ard—an animal whose tail if pulled off is regenerated by a new growth—has the same meaning Most of tho e animals which are utilized as genital symbols in mytholo y and folklore play this part al o in dreams the fish the snail the cat the mouse (on account of the hairiness of the genitals) but above all the snake which is the most important symbol of the male member Small animals and vermin are substitutes for little children e g unde ired sisters or brothers To be infected with vermin is often the equivalent for pre nancy —As a very recent symbol of the male organ I may mention the airship whose employment is ju ti fied by its relation to flying and also occasion ally by its form —Stekel has given a number of other symbols not yet sufficiently verified which he has illustrated by examples The works of this author and especially his book *Die Sprache des Traumes* contain the richest collection of interpretations of symbols some of which were ingeniously guessed and were proved to be correct upon investigation as for example in the section on the symbolism of death The author s lack of critical reflection and his tendency to generalize at all co ts make his interpretations doubtful or inappli cable so that in making use of his works caution is urgently advised I shall there fore restrict myself to mentioning a few ex amples

Right and *left* according to Stekel are to be understood in dreams in an ethical sen e The ri ht hand path always signifies the way to ri hteousness the left hand path the pa h *to crime Thus the left may signify* homo ex uality incest and perversion while the right si nifies marriage relations with a prostitute etc The meaning is always determined by the individual moral standpoint of the dreamer (loc cit p 466) *Relatives* in dreams general ly stand for the genitals (p 473) Here I can confirm this meaning only for the son the daughter and the younger sister—that is wherever *little thing* could be employed On the other hand verified examples allow us to rec o nize *sisters* as symbols of the breasts and *brothers* as symbols of the larger hemispheres To be unable to overtake a carriage is interpret ed by Stekel as regret at being unable to catch up with a difference in age (p 479) The *luggage* of a traveller is the burden of s n by which one is oppressed (*ibid*) But a traveller s lug gage often proves to be an unmistakable symbol

no eckt e

Cf Pfister' w k o rypt g phy a d p t puzzles

f one's own genitals. To numbers, which frequently occur in dreams, Stekel has assigned a fixed symbolic meaning, but these interpretations seem neither sufficiently verified nor of universal validity, although in individual cases they can usually be recognized as plausible. We have, at all events, abundant confirmation that the figure three is a symbol of the male genitals. One of Stekel's generalizations refers to the double meaning of the genital symbols. "Where is there a symbol," he asks, "which (if in any way permitted by the imagination) may not be used simultaneously in the masculine and the feminine sense?" To be sure the clause in parenthesis retracts much of the absolute character of this assertion, for this double meaning is not always permitted by the imagination. But I think it is not superfluous to state that in my experience this general statement of Stekel's requires elaboration. Besides those symbols which are just as frequently employed for the male as for the female genitals, there are others which preponderantly, or almost exclusively, designate one of the sexes, and there are yet others which, so far as we know, have only the male or only the female signification. To use long, stiff objects and weapons as symbols of the female genitals, or hollow objects (chests, boxes, etc.) as symbols of the male genitals, is certainly not permitted by the imagination.

It is true that the tendency of dreams and of the unconscious phantasy to employ the sexual symbols bisexually reveals an archaic trait, for in childhood the difference in the genitals is unknown, and the same genitals are attributed to both sexes. One may also be misled as regards the significance of a bisexual symbol if one forgets the fact that in some dreams a general reversal of sexes takes place, so that the male organ is represented by the female, and vice versa. Such dreams express, for example, the wish of a woman to be a man.

The genitals may even be represented in dreams by other parts of the body: the male member by the hand or the foot, the female genital orifice by the mouth, the ear, or even the eye. The secretions of the human body—mucus, tears, urine, semen, etc.—may be used in dreams interchangeably. This statement of Stekel's, correct in the main, has suffered a justifiable critical restriction as the result of certain comments of R. Reitler's (*Internat. Zeitschr. für Psych.*, 1913). The gist of the matter is the replacement of an important secretion such as the semen, by an indifferent one.

These very incomplete indications may suffice to stimulate others to make a more painstaking collection. I have attempted a much more detailed account of dream-symbolism in my *General Introduction to Psychoanalysis*.

I shall now append a few instances of the use of such symbols, which will show how impossible it is to arrive at the interpretation of a dream if one excludes dream-symbolism, but also how in many cases it is imperatively forced upon one. At the same time I must expressly warn the investigator against overestimating the importance of symbols in the interpretation of dreams, restricting the work of dream-translation to the translation of symbols, and neglecting the technique of utilizing the associations of the dreamer. The two techniques of dream-interpretation must supplement one another; practically, however, as well as theoretically, precedence is retained by the latter process, which assigns the final significance to the utterances of the dreamer, while the symbol-translation which we undertake plays an auxiliary part.

1. The hat as the symbol of a man (of the male genitals). (A fragment from the dream of a young woman who suffered from agoraphobia as the result of her fear of temptation.)

I am walking in the street in summer. I am wearing a s[...] hat of peculiar shape, the m[...] of which [...] upwards [...] the side p[...]es hang downwards (here the d[...] k [...]) and in such a [...] that one hangs lower than the other. I am cheerful and [...] con[...] mood and as I pass a number of young officers I think to myself: You can't do anything to me.

As she could produce no associations to the hat, I said to her: "The hat is really a male genital organ, with its raised middle piece and the two downward hanging side pieces." It is perhaps peculiar that her hat should be supposed to be a man, but after all one says: *Unter die Haube kommen* (to get under the cap) when we mean: *to get married*. I intentionally refrained from interpreting the details concerning the unequal dependence of the two side pieces, although the determination of just such details must point the way to the inter

In spite of all the differences between Scherner's conception of dream-symbolism and the one developed here, I must still insist that Scherner should be recog

pretation I went on to say that if therefore she had a husband with such splendid genitals she would not have to fear the officers that is she would have nothing to wish from them for it was essentially her temptation phantasies which prevented her from goin*g* about unprotected and unaccompanied This last explanation of her anxiety I had already been able to give her repeatedly on the basis of other material

It is quite remarkable how the dreamer behaved after this interpretation She withdrew her description of the hat and would not admit that she had said that the two side pieces were hanging down I was however too sure of what I had heard to allow myself to be misled and so I insisted that she did say it She was quiet for a while and then found the courage to ask why it was that one of her husband s testicles was lower than the other and whether it was the same with all men With this the peculiar detail of the hat was explained and the whole interpretation was accepted by her

The hat symbol was familiar to me long before the patient related this dream From other but less transparent cases I believed that I might assume the hat could also stand for the female genitals

2 The *little one* as the genital organ Being run over as a symbol of sexual intercourse

(Another dream of the same agoraphobic patient)

Her mother sends away her little daughter so that she has to go alone She then drives with her mother to the railway station and sees her little one walking right along the track so that she is bound to be run over Sl e hea s the bones crack (At this she experiences a feeling of discomfo t but no real horror) She then looks out through tl e car iage window to see whether the parts cannot be seen behind Then she reproaches her mother for allowing the little one to go out alone

Analysis—It is not an easy matter to give here a complete interpretation of the dream It forms part of a cycle of dreams and can be fully understood only in connection with the rest For it is not easy to obtain the material necessary to demonstrate the symbolism in a sufficiently isolated condition The patient at first finds that the railway journey is to be interpreted historically as an allusion to a departure from a anatorium for nervous diseases with whose director she was of course in love Her mother fetched her away and before her departure the physician came to the railway station and gave her a bunch of flowers she felt uncomfortable because her mother witnessed this attention Here the mother therefore appears as the disturber of her tender feelings a role actually played by this strict woman during her dau hter s girlhood—The *next association referred to the sentence She then looks to see whether the parts cannot be seen behind* In the dream façade one would naturally be compelled to think of the pieces of the little daughter who had been run over and crushed The association however turns in quite a different direction She recalls that she once saw her father in the bath room naked from behind she then begins to talk about sex differences and remarks that in the man the genitals can be seen from behind but in the woman they cannot In this connection she now herself offers the interpretation that *the little one* is the genital organ and her little one (she has a four year old daughter) her own organ She reproaches her mother for wantin her to live as thou h she had no genitals and recognizes this reproach in the introductory sentence of the dream the mother sends her little one away so that she has to go alone In her phantasy goin alone throu h the streets means having no man no sexual relations (*coire*=to go together) and this she does not like According to all her statements she really suffered as a girl through her mother s jealousy because her father showed a preference for her

The deeper interpretation of this dream depends upon another dream of the same night in which the dreamer identifies herself with her brother She was a tomboy and was always being told that he should have been born a boy This identification with the brother shows with especial clearness that *the little one* i nifies the genital organ The mother threatened him (her) with castration which could only be understood as a punishment for playing with the genital parts and the identification therefore shows that she herself had masturbated as a child though she had retained only a memory of her brother s havin*g* done so An early knowledge of the male genitals which she lost later must according to the assertions of this second dream have b en acquired at this time Moreover the second dream points to the infantile sexual theory that girls origi

Cf I cbg b fo m l mpl (*Z t l bl tt f P y cl ly* [9] p 95) St k l po ted a d m wh ch th h t th bl q ly sta d g f th th m ddle ymbol d th (*mpo- te t*) m

me from boys as a result of castration. After I had told her of this childish belief she at once confirmed it by an anecdote in which the boy asks the girl "Was it cut off?" to which the girl replies "No, it's always been like that."

Consequently the sending away of *the little* [illegible] of the genital organ in the first dream refers also to the threatened castration. Finally she blames her mother for not having borne her as a boy.

That *being run over* symbolizes sexual intercourse would not be evident from this dream if we had not learned it from many other sources.

3. Representation of the genitals by buildings, stairs and shafts.

(Dream of a young man inhibited by a father complex.)

He is taking a walk with his father in a place which is certainly the Prater for one can see the Rotunda, in front of which there is a small [illegible] to which there is attached a captive balloon; the balloon however seems rather limp. His father asks him what this is all for; he is surprised at it but he explains it to his father. They come into a courtyard in which lies a large sheet of tin. His father wants to pull off a big piece of this but first looks round to see if anyone is watching. He tells his father that all he needs to do is to speak to the overseer and then he can take as much as he wants without any more ado. From this courtyard a flight of stairs leads down into a shaft the walls of which are softly upholstered rather like an arm-chair. At the end of this shaft there is a long platform and then a new shaft begins.

Analysis. This dreamer belonged to a type of patient which is not at all promising from a therapeutic point of view up to a certain point in the analysis such patients offer no resistance whatever but from that point onwards they prove to be almost inaccessible. This dream he analysed almost independently. "The Rotunda," he said, "is my genitals, the captive balloon in front is my penis about whose flaccidity I have been worried." We must however interpret it in greater detail: the Rotunda is the buttocks constantly associated by the child with the genitals, the small structure in front the scrotum. In the dream his father asks him what this is all for—that is, he asks him about the purpose and arrangement of the genitals. It is quite evident that this state of affairs should be reversed and that he ought to be the questioner. As such questioning on the part of the father never occurred in reality we must conceive the dream thought as a wish, or perhaps take it conditionally as follows: "If I had asked my father for sexual enlightenment." The continuation of this thought we shall presently find in another place.

The courtyard in which the sheet of tin is spread out is not to be conceived symbolically in the first instance but originates from his father's place of business. For reasons of discretion I have inserted the tin for another material in which the father deals without however changing anything in the verbal expression of the dream. The dreamer had entered his father's business and had taken a terrible dislike to the somewhat questionable practices upon which its profit mainly depended. Hence the continuation of the above dream thought ("if I had asked him") would be: "He would have deceived me just as he does his customers." For the *pulling off* which serves to represent commercial dishonesty the dreamer himself gives a second explanation, namely masturbation. This is not only quite familiar to us (see above p. 281) but agrees very well with the fact that the secrecy of masturbation is expressed by its opposite (one can do it quite openly). Thus it agrees entirely with our expectations that the autoerotic activity should be attributed to the father just as was the questioning in the first scene of the dream. The shaft he at once interprets as the vagina by referring to the soft upholstering of the walls. That the action of coition in the vagina is described as a going down instead of in the usual way as a going up agrees with what I have found in other instances.

The details—that at *the end of* the first shaft there is a long platform and then a new shaft—he himself explains biographically. He had for some time had sexual intercourse with women but had given it up on account of inhibitions and now hopes to be able to begin it again with the aid of treatment. The dream however becomes indistinct toward the end, and to the experienced interpreter it becomes evident that in the second scene of the dream the influence of another subject has already begun to assert itself which is indicated by his father's business his dishonest practices and the vagina represented by the first shaft so that one may assume a reference to his mother.

Cf. comment in the Zentralblatt für Psychoanalyse, [illegible] and see above p. [illegible] note 4.

4 The male organ symbolized by persons and the female by a landscape

(Dream of a woman of the lower class whose husband is a policeman reported by B Dattner)

Then someone broke into the house and she anxiously called for a policeman But he went peacefully with two tramps into a church to which a great many steps led up behind the church there was a mountain on top of which there was a dense forest The policeman was provided with a helmet a gorget and a cloak The two vagrants who went along with the policeman quite peaceably had sack like aprons tied round their loins A road led from the church to the mountain This road was over grown on each side with grass and brushwood which became thicker and thicker as it reached the top of the mountain where it spread out into quite a forest

[1] 5 Castration dreams of children

(a) A boy aged three years and five months for whom his father s return from mil itary service is clearly inconvenient wakes one morning in a disturbed and excited state and constantly repeats the question Why did Dad dy carry his head on a plate? Last night Daddy carried his head on a plate

(b) A student who is now suffering from a severe obsessional neurosis remembers that in his sixth year he repeatedly had the follow ing dream He goes to the barber to have his hair cut Then a large woman with severe fea tures comes up to him and cuts off his head He recogni es the woman as his mother

6 A modified staircase dream

To one of my patients a sexual abstainer who was very ill whose phantasy was fixated upon his mother and who repeatedly dreamed of climbin tairs while accompanied by his mother I once remarked that moderate mas turbation would probably have been less harm ful to him than his enforced abstinence The influence of this remark provoked the follow ing dream

His piano teacher reproaches him for neg lecting his piano playing and for not practic ing the Etudes *of Moscheles and Clementi s* Gradus ad Parnassum With reference to this he remarked that the *Gradus* too is a stair way and that the piano itself is a stairway as it has a scale

It may be said that there is no class of ideas which cannot be enlisted in the repre entation of sexual facts and wishes

7 The sensation of reality and the repre sentation of repetition

A man now thirty five relates a clearly re membered dream which he claims to have had when he was four years of age *The notary with whom his father s will was deposited*—he had lost his father at the age of three—*brought two large Emperor pears of which h was given one to eat The other lay on the window sill of the living room* He woke with the conviction of the reality of what he had dreamt and obstinately asked his mother to give him the second pear it was he said still lyin on the window sill His mother laughed at this

Analysis The notary was a jovial old gen tleman who as he seems to remember really sometimes brought pears with him The win dow sill was as he saw it in the dream Nothin else occurs to him in this connection except perhaps that his mother has recently told him a dream She has two birds sitting on her head she wonders when they will fly away but they do not fly away and one of them flies to her mouth and sucks at it

The dreamer s inability to furnish associa tions justifies the attempt to interpret it by the substitution of symbols The two pears—*pommes ou poires*—are the breasts of the moth er who nursed him the window sill is the pro jection of the bosom analogous to the balco nies in the dream of houses His sensation of reality after wakin is justified for his mother had actually suckled him for much longer than the customary term and her breast was still available The dream is to be translated Mother give (show) me the breast again at which I once used to drink The *once* is rep resented by the eating of the one pear the *again* by the desire for the other *The temporal repetition* of an act is habitually represented in dreams by *the numerical multiplication of an object*

It i naturally a very striking phenomenon that symbolism should already play a part in the dream of a child of four but this is the rule rather than the exception One may say that the dreamer has command of symbolism from the very first

The early age at which people make use of symbolic representation even apart from the

dream-l... may be own by the f owi... uninfluenced memory of a lad who s now twenty-seven. *She is in her fourth year. The nursemaid is driving her with her brother ... eleven months younger and a cousin who is ... between the two in age to the lavatory, so that ... before the two go to the lavatory, so that they can do their l e bus ess there before going for their walk. As the eldest she sits ... the seat, ... the other two on chambers. She asks her (female) cousin: Have you a purse, ... Walter has a little sausage; I have a purse. The cousin answers: Yes, I have a purse too. The nursemaid listens, laughing, and relates the conversation to the mother, who reacts with a sharp reprimand.*

Here a dream may be inserted whose ex... ... symbolism permitted ... interpretation with ... assistance from the dreamer.

8. The question of symbolism in the dreams of normal persons.

An objection frequently raised by the opponents of psycho-analysis—and recently also by Havelock Ellis—is that, although dream-symbolism may perhaps be a product of the neurotic psyche, it has no validity whatever in the case of normal persons. But while psycho-analysis recognizes no essential distinctions but only quantitative differences between the psychic life of the normal person and that of the neurotic, the analysis of those dreams in which, in sound and sick persons alike, the repressed complexes display the same ... reveals the absolute identity of the mechanisms as well as of the symbolism. Indeed, the natural dreams of healthy persons often contain a much simpler, more transparent, and more characteristic symbolism than those of neurotics, which, owing to the greater strictness of the censorship and the more extensive dream-distortion resulting therefrom, are frequently troubled and obscured, and are therefore more difficult to translate. The following dream serves to illustrate this fact. This dream comes from a non-neurotic girl of a rather prudish and reserved type. In the course of conversation I learn that ... was engaged to be married, but that there were hindrances in the way of the marriage, which threatened to postpone it. She related spontaneously the following dream:

I arrange the centre of a table with flowers for a birthday. On being questioned she states that in the dream she seemed to be at home (she has no home at the time) and experienced a feeling of happiness.

The popular symbolism enables me to translate the dream for myself. It is the expression of her wish to be married: the table with the flowers in the centre is symbolic of herself and her genitals. She represents her future wishes as fulfilled inasmuch as she is already occupied with the thoughts of the birth of a child; so the wedding has taken place long ago.

I call her attention to the fact that *the centre of a table* is an unusual expression, which she admits; but here, of course, I cannot question her more directly. I carefully refrain from suggesting to her the meaning of the symbols, and ask her merely for the thoughts which occur to her mind in connection with the individual parts of the dream. In the course of the analysis her reserve gave way to a distinct interest in the interpretation, and a frankness which was made possible by the serious tone of the conversation. To my question as to what kind of flowers they had been, her first answer is: *expensive flowers; one has to pay for them*; then she adds that they were *lilies of the valley, violets, and pinks or carnations*. I took the word *lily* in this dream in its popular sense, as a symbol of chastity; she confirmed this assumption, as purity occurred to her in association with *lily*. *Valley* is a common feminine dream-symbol. The chance juxtaposition of the two symbols in the name of the flower is made into a piece of dream-symbolism, and serves to emphasize the preciousness of her virginity—*expensive flowers, one has to pay for them*—and expresses the expectation that her husband will know how to appreciate its value. The comment, *expensive flowers*, etc., has, as will be shown, a different meaning in every one of the three different flower-symbols.

I thought of what seemed to me a very risky explanation of the hidden meaning of the apparently quite asexual word *violets* by an unconscious relation to the French *viol*. But to my surprise the dreamer's association was the English word *violate*. The accidental phonetic similarity of the two words *violet* and *violate* is utilized by the dream to express in *the language of flowers* the idea of the violence of defloration (another word which makes use of flower-symbolism) and perhaps also to give expression to a masochistic tendency on the part of the girl. An excellent example of the word bridges across which run the paths to the

Alfred Robitsek in the *Zentralblatt für Psychoanalyse*, ( ), p. 3
The World of Dreams, London ( ), p. 3

unconscious *One has to pay for them* here means *life* with which she has to pay for becoming a wife and a mother

In association with *pinks* which she then calls *ca nations* I think of *carnal* But her association is *colour* to which she adds that *carnations* are the flowers which her fiancé gives her frequently and in lar e quantities At the end of the conversation she suddenly admits spontaneou ly that she has not told me the truth the word that occurred to her was not *colour* but *incarnation* the very word I expected Moreover even the word *colour* is not a remote association it was determined by the meaning of *carnation* (i e *flesh colour*)—that is by the complex This lack of honesty shows that the resistance here is at its greatest because the symbolism is here most transparent and the struggle between libido and repression is most intense in connection with this phallic theme The remark that these flowers were often given her by her fiance is together with the double meaning of *carnation* a still further indication of their phallic significance in the dream The occasion of the present of flowers during the day is employed to express the thought of a sexual present and a return present She gives her virginity and expects in return for it a rich love life But the words *expensive flowers one has to pay for them* may have a real financial meaning The flower symbolism in the dream thus comprises the virginal female the male symbol and the reference to violent defloration It is to be noted that sexual flower symbolism which of course is very widespread symbolizes the human sexual organs by flowers the sexual organs of plants indeed presents of flowers between lovers may have this unconscious si nif cance

The birthday for which she is making preparations in the dream probably signifies the birth of a child She identifies herself with the bridegroom and represents him preparing her for a birth (having coitus with her) It is as thou h the latent thou ht were to say If I were he I would not wait but I would deflower the bride without asking her I would use violence Indeed the word *violate* points to this Thus even the sadistic libidinal components find expression

In a deeper stratum of the dream the sentence *I arrange* etc probably has an autoerotic that is an infantile significance

She also has a knowled e—possibly only in the dream—of her physical need she sees herself flat like a table so that she emphasizes all the more her virginity the costliness of the *centre* (another time she calls it a *centre piece of flowers)* Even the horizontal element of the table may contribute something to the symbol The concentration of the dream is worthy of remark nothing is superfluou every word is a symbol

Later on she brings me a supplement to this dream *I decorate the flowers with g een crinkled paper* She adds that it was *fancy p per* of the ort which is u ed to disguise ordinary flower pots She says also To hide untidy things whatever was to be seen which was not pretty to the eye there is a gap a little space in the flowers The paper looks like velvet or moss With *decorate* she associates *decorum* as I expected The green colour is very prominent and with this she associates *hope* yet another reference to pregnancy In this part of the dream the identification with the man is not the dominant feature but thou hts of shame and frankness express them elves She makes herself beautiful for him she admits physical defects of which she is ashamed and which she wishes to correct The associations *velvet* and *moss* distinctly point to *crines pubis*

The dream is an expression of thou hts hardly known to the waking state of the girl thoughts which deal with the love of the sen es and its organs she is *prepared for a bi th day* i e she has coitus the fear of defloration and perhaps the pleasurably toned pain find expression she admits her physical defects and overcompensates them by means of an over-e ti mation of the value of her virginity Her shame excu es the emerging ensuality by the fact that the aim of it all is the child Even material considerations which are foreign to the lover find expression here The affect of the simple dream—the feeling of bliss—shows that here strong emotional complexes have found sati faction

(A young man who has been trying to give up his habit of masturbation by substituting intercourse with a woman)

P elii ii iary statement On the day before the dream he had been instructing a student as to *G igna d s* reaction in which magne i um is dissolved in absolutely pure ether under the catalytic influence of iod ne Two days earlier there had been an explosion in the course of the ame reaction in which someone had burned his hand

Dream I. *He is going to make phenylmagne sium rem...e he sees the a paratus w h par ticular dis inctness but he h..s subst ted h...e f for the magnesi m He is now in a cu rious wavering att ..de He keeps on s..e t g to kms lf This is the right th g it is work ing my f et are beginn g to dissolve and my k..e are getting soft Then h e ches down and f ..s for his feet and meanwh e (he does n.t know how) he t..kes his legs out of the crucible and then agai he says to h mself That can't be } es has been done cor rectly Then he partially wakes and he is th d e m t k ms lf because he wants t tell it t me H is positive ly afraid of the analysis of the dre m He is m ch excit d during this state f sem e p and epeats con ually Phenyl phenyl.*

II *He is in wi..h h..s whole f mil He is supposed to b at the Schottentor at half past eleven in order t keep a appo tment with the Lady in q tion but he does not wake w.. half past leven He says to h mself It is too l..e ow when you g t there it will be h..f past twelve The ext moment he sees the who e f m..ly gathered b t the table— his mo her and the parlourmaid with th soup tur en w h peculiar distinctne The he says to him elf W ll f w ar tting down to eat we c..y I certainly c..n t g t away*

A ..lysis He feels ure that even the first dream contains a ref ren to the lad whom he is to meet at the place of re dezvous (the dream was dreamed during the night befo e the expected meeting) The t dent whom he w.. instructin s a par cula ly unpleasant fellow the chemist had sa d to him That isn't right, because th magnesium was still unaffected, and the student had answered, as though he were quit unconcerned "Nor it is H himself must be this student he is as in different to hi *analysis* as th student is to his synth sis the *he* in th dream h wever wh perf rm th operation, is myself How unpleasant he must seem to me with his in di..rence to the result!

Again h is th ma erial with which the an ...lysis (synthesis) ...mad For the question the su ces f the treatment. The legs in the dream recall an impres..on f the prev ous evenin.. He met a lady at da can lass of wh m he wished t mak a quest h pressed her t him so closel that ..he on cried out. As he eased t pres he legs h f lt her firm, respondin.. pressure ..ainst hi lowe thighs as far as just bove th knees the pot men tioned in the dream. In this situation then the woman is the magnes um in the *retort* which is at last wo ki..g He is femi e towards me as he is ..rile towards the woman If he su ceeds with the woma the treatmen w'll also succeed Feeling himself and becom aware of his knees refers to ma turbation and corre sponds to his fa gue of the previous day The rendezvous had actually been made for half pa t eleven H s wi h to oversleep h m self and to keep to his sexual object at home (that is masturbation) corresponds to his res st ance

He says in respect to the repet t on of the n me phen l that all these rad cals end g in yl ha e always been pleas to him they are very con en e t to use benzyl acetyl etc. That, however expla ed no hi g But when I proposed the root *Schlem hl* he laughed heart ily and told me that duri g the summer he had read a book by P évost which c nta ned a chapt r *Les e cl s de l'amour* and in this there was ome men on of *Schlemiels* and in read ng of thes ou cas s he ..a d to h m self "That is my case He would ha e played the *Schlem hl* if he had mi sed the appo t ment.

It seems that the sexual symbol m of dreams has alre dy been d rectly confirmed by experi ment. In 1912 Dr K. Sch tter at the instance of H Sw boda, produced dreams in deeply h p notized persons by s ggest ons wh ch deter mi ed a large part of the dream-content If the uggest on p oposed that the ubject should dream f n rmal or abn rmal sexual relations the dream carried out these ord rs by replac ing sexual material by the symbols w th which psycho-anal t c dream interpretation has made us familiar Thus following the suggest on that the dreamer hould dream of homosexual re lations with a L.dy fri nd this friend appea ed in the dream carrying a shabby tra eling bag upon which there was a label with the printed w rds Fo ladies only The dreame was believ d e to ha e he d of dream symbolization f dream-interp et t on. U f rtunately the alue f this important in estigation was d mini hed by th f ct that D Schr tt shortly afterw ds comm tted suicide Of his dream-experiments he ga e us only a preliminary report in the *Ze tralblatt fur Psychoanaly e*

Similar result were reported in 19 3 by G R ffenstein E pecially interesti g were the ex periments performed by Betlh im and Hart mann, because they eliminated hypnos s. These

authors told stories of a crude sexual content to confused patients suffering from Korsakoff s psychosis and observed the distortions which appeared when the material related was repro duced It was shown that the reproduced ma terial contained symbols made familiar by the interpretation of dreams (climbing stairs stab bing and shooting as symbols of coitus knives and ci arettes as symbols of the penis) Special value was attached to the appearance of the symbol of climbing stairs for as the authors justly observed a symbolization of this sort could not be effected by a conscious wish to distort

Only when we have formed a due estimate of the importance of symbolism in dreams can we continue the study of the *typical dreams* which was interrupted in an earlier chapter (p 248) I feel justified in dividing these dreams roughly into two classes first those which al ways really have the same meaning and sec ond those which despite the same or a similar content must nevertheless be given the most varied interpretations Of the typical dreams belonging to the first class I have already dealt fairly fully with the examination dream

On account of their similar affective charac ter the dreams of missing a train deserve to be ranked with the examination dreams more over their interpretation justifies this approxi mation They are consolation dreams directed against another anxiety perceived in dreams— the fear of death *To depart* is one of the most frequent and one of the most readily estab lished of the death symbols The dream there fore says consolingly Reassure yourself you are not going to die (to depart) ju t as the examination dream calms us by saying Don t be afraid this time too nothing will happen to you The difficulty is understanding both kinds of dreams is due to the fact that the anxiety is attached precisely to the expression of consolation

The meaning of the *d eams due to dental stimulus* which I have often enough had to analyse in my patients escaped me for a long time because much to my astonishment they habitually offered too great a resistance to in terpretation But finally an overwhelming mass of evidence convinced me that in the case of men nothing other than the masturbatory de sires of puberty furnish the motive power of these dreams I shall analyse two such dreams one of which is also a *flyin d eam* The two dreams were dreamed by the same person—a young man of pronounced homosexuality which, however has been inhibited in life

He is witnessing a performance of Fidelio *from the stalls of the operahouse he is sitting next to L whose personality is congenial to him and whose friendship he would like to have Suddenly he flies diagonally right across the stalls he then puts his hand in his mouth and draws out two of his teeth*

He himself describes the fl ght by sayin that it was as though he were thrown into the air As the opera performed was *Fidelio* he recalls the words

He who a charming wife acquires

But the acquisition of even the most charming wife is not among the wishes of the dreamer Two other lines would be more appropriate

He who succeeds in the lucky (big) throw
The friend of a friend to be

The dream thus contains the *luc*k*y (big) throw* which is not however a wish fulfilment only For it conceals also the painful reflection that in his striving after friendship he has often had the misfortune to be *thrown out* and the fear lest this fate may be repeated in the case of the young man by whose side he has en joyed the performance of *Fidelio* This is now followed by a confession shameful to a man of his refinement to the effect that once after such a rejection on the part of a friend his profound sexual longing caused him to mastur bate twice in succession

The other dream is as follows *Two uni versity professors of his acquai tance are treat ing him in my place One of them does some thing to his penis he is afraid of an operation The other thrusts an iron bar against his mo th so that he loses one or two teeth He is bound with four silk handkerchiefs*

The sexual significance of this dream can hardly be doubted The silk handkerchiefs al lude to an identification with a homosexual of his acquaintance The dreamer who has never achieved coition (nor has he ever actually sought sexual intercourse) with men conceives the sexual act on the lines of masturbation with which he was familiar during puberty

I believe that the frequent modifications of the typical dream due to dental stimulus—that, for example in which another person draws the tooth from the dreamer s mouth—will be made

Uber Fehl kt b d K k ff h P y ch se Arch f P ych t ie V 1 LXXII (9 4)

explicable by the same explanation. It may, however, be difficult to understand how dental stimuli can have come to have this significance. But here I may draw attention to the frequently occurring *displacement from below to above*, which is at the service of sexual repression, and by means of which all kinds of sensations and intentions occurring in hysteria, which ought to be localized in the genitals, may at all events be realized in other, unobjectionable parts of the body. We have a case of such displacement when the genitals are replaced by the face in the symbolism of unconscious thought. This is corroborated by the fact that verbal usage relates the buttocks to the cheeks, and the labia to the lips which enclose the aperture of the mouth. The nose is compared to the penis in numerous allusions, and in each case the presence of hair completes the resemblance. Only one feature—the teeth—is beyond all possibility of being compared in this way; but it is just this coincidence of agreement and disagreement which makes the teeth suitable for purposes of representation under the pressure of sexual repression.

I will not assert that the interpretation of dreams due to dental stimulus as dreams of masturbation (the correctness of which I can not doubt) has been freed of all obscurity. I carry the explanation as far as I am able, and must leave the rest unsolved. But I must refer to yet another relation indicated by a colloquial expression. In Austria there is in use an indelicate designation for the act of masturbation, namely: "To pull one out," or "to pull one off." I am unable to say whence these colloquialisms come, or on what symbolisms they are based; but the teeth would very well fit in with the first of the two.

Dreams of pulling teeth, and of teeth falling out, are interpreted in popular belief to mean the death of a connection. Psycho-analysis can admit of such a meaning only at the most as a joking allusion in the sense already indicated.

To the second group of typical dreams belong** those in which one is flying or hovering, falling, swimming, etc. What do these dreams signify? Here we cannot generalize. They mean, as we shall learn, something different in each case; only the sensory material which they contain always comes from the same source.

We must conclude from the information obtained in psycho-analysis that these dreams also repeat impressions of our childhood—that is, that they refer to the games involving movement which have such an extraordinary attraction for children. Where is the uncle who has never made a child fly by running with it across the room, with outstretched arms, or has never played at falling with it by rocking it on his knee and then suddenly stretching out his leg, or by lifting it above his head and suddenly pretending to withdraw his supporting hand? At such moments children shout with joy and insatiably demand a repetition of the performance, especially if a little fright and dizziness are involved in it. In after years they repeat their sensations in dreams, but in dreams they omit the hands that held them, so that now they are free to float or fall. We know that all small children have a fondness for such games as rocking and see-sawing; and when they see gymnastic performances at the circus their recollection of such games is refreshed. In some boys the hysterical attack consists simply in the reproduction of such performances, which they accomplish with great dexterity. Not infrequently sexual sensations are excited by these games of movement, innocent though they are in themselves. To express the matter in a few words: it is these romping games of childhood which are being repeated in dreams of flying, falling, vertigo and the like, but the pleasurable sensations are now transformed into anxiety. But, as every mother knows, the romping of children often enough ends in quarreling and tears.

I have therefore good reason for rejecting the explanation that it is the condition of our cutaneous sensations during sleep, the sensation of the movements of the lungs, etc., that evoke dreams of flying and falling. As I see it, these sensations have themselves been reproduced from the memory to which the dream refers—that they are therefore dream-contents, and not dream-sources.

This material, consisting of sensations of motion, similar in character and originating from the same sources, is now used for the

** This passage dealing with dreams of motion, is repeated on account of the context. Cf. p. 50.

representation of the most manifold dream thoughts Dreams of flying or hovering for the most part pleasurably toned will call for the most widely differing interpretations—interpretations of a quite special nature in the case of some dreamers and interpretations of a typical nature in that of others One of my patients was in the habit of dreaming very frequently that she was hovering a little way above the street without touching the ground She was very short of stature and she shunned every sort of contamination involved by intercourse with human beings Her dream of suspension —which raised her feet above the ground and allowed her head to tower into the air—fulfilled both of her wishes In the case of other dreamers of the same sex the dream of flying had the significance of the longing If only I were a little bird! Similarly others become angels at night because no one has ever called them angels by day The intimate connection between flying and the idea of a bird makes it comprehensible that the dream of flying in the case of male dreamers should usually have a coarsely sensual significance and we should not be surprised to hear that this or that dreamer is always very proud of his ability to fly

Dr Paul Federn (Vienna) has propounded the fascinating theory that a great many flying dreams are erection dreams since the remarkable phenomenon of erection which constantly occupies the human phantasy cannot fail to be impressive as an apparent suspension of the laws of gravity (cf the winged phalli of the ancients)

It is a noteworthy fact that a prudent experimenter like Mourly Vold who is really averse to any kind of interpretation nevertheless defends the erotic interpretation of the dreams of flying and hovering He describes the erotic element as the most important motive factor of the hovering dream and refers to the strong sense of bodily vibration which accompanies this type of dream and the frequent connection of such dreams with erections and emissions

Dreams of *falling* are more frequently characterized by anxiety Their interpretation when they occur in women offers no difficulty because they nearly always accept the symbolic meaning of falling which is a circumlocution for giving way to an erotic temptation We have not yet exhausted the infantile sources of the dream of falling nearly all children have fallen occasionally and then been picked up and fondled if they fell out of bed at night they were picked up by the nurse and taken into her bed

People who dream often and with great enjoyment of *swimming* cleaving the wave etc., have usually been bed wetters and they now repeat in the dream a pleasure which they have long since learned to forego We shall soon learn from one example or another to what representations dreams of swimming easily lend themselves

Th —

that they may not wet the bed at night These dreams also are based on reminiscences of the *enuresis nocturna* of childhood In my Fragment of an Analysis of Hysteria I have given the complete analysis and synthesis of such a dream of fire in connection with the infantile history of the dreamer and have shown for the representation of what maturer impulses this infantile material has been utilized

It would be possible to cite quite a number of other *typical* dreams if by such one understands dreams in which there is a frequent recurrence in the dreams of different persons of the same manifest dream content For example dreams of passing through narrow alleys or a whole suite of rooms dreams of burglars in respect of whom nervous people take measures of precaution before going to bed dreams of being chased by wild animals (bulls horses) or of being threatened with knives daggers and lances The last two themes are characteristic of the manifest dream content of persons suffering from anxiety etc A special investigation of this class of material would be well worth while In lieu of this I shall offer two observations which do not however apply exclusively to typical dreams

The more one is occupied with the solution of dreams the readier one becomes to acknowledge that the majority of the dreams of adults deal with sexual material and give expression to erotic wishes Only those who really analyse dreams that is those who penetrate from their manifest content to the latent dream thoughts can form an opinion on this subject but never those who are satisfied with registering merely the manifest content (as for example Näcke

in his writings on sexual dreams) Let us recognize at once that there is nothing astonishing in this fact, which is entirely consistent with the principles of dream interpretation. No other instinct has had to undergo so much suppression, from the time of childhood onwards, as the sexual instinct in all its numerous components from no other instincts are so many and such intense unconscious wishes left over which now in the sleeping state generate dreams. In dream-interpretation this importance of the sexual complexes must never be forgotten, though one must not of course exaggerate it to the exclusion of all other factors

Of many dreams it may be ascertained, by careful interpretation, that they may even be understood bisexually inasmuch as they yield an indisputable over interpretation in which they realize homosexual impulses—that is impulses which are contrary to the normal sexual activity of the dreamer But that all dreams are to be interpreted bisexually as Stekel maintains, and Adler seems to me to be a generalization as insusceptible of proof as it is improbable and one which, therefore I should be loth to defend for I should, above all be at a loss to know how to dispose of the obvious fact that there are many dreams which satisfy other than erotic needs (taking the word in the widest sense) as for example dreams of hunger thirst, comfort, etc. And other similar assertions to the effect that behind every dream one finds a reference to death (Stekel) or that every dream shows an advance from the feminine to the masculine line (Adler) seem to me to go far beyond the admissible in the interpretation of dreams The assertion that *all dreams call for a sexual interpretation* against which there is such an untiring polemic in the literature of the subject, is quite foreign to my *Interpretation of Dreams* It will not be found in any of the eight editions of this book, and is in palpable contradiction to the rest of its contents

We have stated elsewhere that dreams which are conspicuously *innocent* commonly embody crude erotic wishes and this we might confirm by numerous further examples But many dreams which appear indifferent, in which we should never suspect a tendency in any particular direction may be traced, according to the analysis to unmistakably sexual wish impulses often of an unexpected nature For example who before it had been interpreted would have suspected a sexual wish in the following dream? The dreamer relates *Between two stately palaces there stands a little way back a small house whose doors are closed My wife leads me along the little bit of road leading to the house and pushes the door open and then I slip quickly and easily into the interior of a courtyard that slopes steeply upwards*

Anyone who has had experience in the translating of dreams will of course at once be reminded that penetration into narrow spaces and the opening of locked doors are among the commonest of sexual symbols and will readily see in this dream a representation of attempted coitus from behind (between the two stately buttocks of the female body) The narrow steep passage is of course the vagina the assistance attributed to the wife of the dreamer requires the interpretation that in reality it is only consideration for the wife which is responsible for abstention from such an attempt Moreover inquiry shows that on the previous day a young girl had entered the household of the dreamer she had pleased him, and had given him the impression that she would not be wholly averse to an approach of this sort. The little house between the two palaces is taken from a reminiscence of the Hradschin in Prague and once more points to the girl, who is a native of that city

If in conversation with my patients I emphasize the frequency of the Oedipus dream—the dream of having sexual intercourse with one's mother—I elicit the answer I cannot remember such a dream Immediately afterwards however there arises the recollection of another an unrecognizable indifferent dream which the patient has dreamed repeatedly and which on analysis proves to be a dream with this very content—that is yet another Oedipus dream. I can assure the reader that disguised dreams of sexual intercourse with the dreamer's mother are far more frequent than undisguised dreams to the same effect.

There are dreams of landscapes and locali ties in which emphasis is always laid upon the as urance I have been here before But this *Déjà v i* has a special significance in dreams In this case the locality is always the genitals of the mother of no other place can it be as serted with such certainty that one *has been here before* I was once puzzled by the account of a dream given by a patient afflicted with obsessional neurosis He dreamed that he called at a house where he had been *twice* before But this very patient had long ago told me of an episode of his sixth year At that time he shared his mother s bed and had abu ed the occa ion by inserting his finger into his mother s genitals while she was asleep

A lar e number of dreams which are fre quently full of anxiety and often have for content the traversing of narrow spaces or staying long in the water are based upon phan tasies concerning the intra uterine life the sojourn in the mother s womb and the act of birth I here insert the dream of a y ung man who in his phantasy has even profited by the intra uterine opportunity of spying upon an act of coition between his parents

He is in a deep shaft in which there is a window as in the Semmering tunn l Through this he sees at first an empty la dscape and then he composes a picture in it which is there all at once and fills up the empty space The picture represents a field which is being deep y tilled by an implement and the wholesome air the associated idea of hard work and th bluish black clods of earth make a pleasant im pression on hi He then goes on and sees a work on education lying open ard is su prised that so much attention is devoted in it to the sexual feelings (of children) w ich makes him think of me

Here is a pretty water-dream of a female patient which was turned to special account in the course of treatment

At her usual holiday resort on the Lake she flings herself into the dark water at a place where the pale moon is reflected in the water

Dreams of this sort are parturition dreams their interpretation is effected by reversing the fact recorded in the manifest dream conten thus instead of *flinging oneself into the wa er* read *coming out of the water*—that is *being born* The place from which one i born may be recognized if one thinks of the humorous sen e of the French *la lune* The pale moon thus becomes the white *bottom* which the child soon gue ses to be the place from which it came Now what can be the meanin of th patient s wishing to be born at a holiday re sort? I asked the dreamer this and he replied without hesitation Hasn t the treatment made me as thou h I were *born aga n?* Thus the dream becomes an invitation to continue the treatment at this summer resort—that is to visit her there perhaps it also contains a very bashful allu ion to the wish to become a mother her elf

A[illegible]er dream of parturition with its interpretation, I take from a paper by E. Jones. *She stood at the seashore watching a small boy, who seemed to be hers, wading into the water. This he did till the water covered him and she could only see his head bobbing up and down near the surface. The scene then changed to the crowded hall of an hotel. Her husband left her, and she entered into conversation with a stranger.*

The second half of the dream was discovered in the analysis to represent flight from her husband, and the entering into intimate relations with a third person, behind whom was plainly indicated Mr. X's brother mentioned in a former dream. The first part of the dream was a fairly evident birth-phantasy. In dreams as in mythology, the delivery of a child from the uterine waters is commonly represented by way of distortion as the entry of the child into water; among many other instances, the births of Adonis, Osiris, Moses, and Bacchus are well-known illustrations of this. The bobbing up and down of the head in the water at once recalled to the patient the sensation of quickening which she had experienced in her only pregnancy. Thinking of the boy going into the water induced a reverie in which she saw herself taking him out of the water, carrying him into the nursery, washing and dressing him, and installing him in her household.

"The second half of the dream, therefore, [illegible]

tent content, the birth phantasy. Besides this inversion in the order, further inversions took place in each half of the dream. In the first half the child entered the water, and then his head bobbed; in the underlying dream thoughts the quickening occurred first, and then the child left the water (a double inversion). In the second half her husband left her; in the dream-thoughts she left her husband.

Another parturition dream is related by Abraham—the dream of a young woman expecting her first confinement: *From one point of the floor of the room a subterranean canal leads directly to the water (path of parturition—amniotic fluid). She lifts up a trap in the floor, and there immediately appears a creature dressed in brownish fur, which almost resembles a seal. This creature changes into the dreamer's younger brother, to whom her relation has always been maternal in character.*

Rank has shown from a number of dreams that parturition-dreams employ the same symbols as micturition-dreams. The erotic stimulus expresses itself in these dreams as an urethral stimulus. The stratification of meaning in these dreams corresponds with a change in the significance of the symbol since childhood.

We may here turn back to the interrupted theme (see p. 190) of the part played by organic, sleep-disturbing stimuli in dream formation. Dreams which have come into existence under these influences not only reveal quite frankly the wish-fulfilling tendency and the character of convenience-dreams, but they very often display a quite transparent symbolism as well, since waking not infrequently follows a stimulus whose satisfaction in symbolic disguise has already been vainly attempted in the dream. This is true of emission dreams as well as those evoked by the need to urinate or defecate. The peculiar character of emission dreams permits us *directly* to unmask certain sexual symbols already recognized as typical, but nevertheless violently disputed, and it also convinces us that many an apparently innocent dream situation is merely the symbolic prelude to a crudely sexual scene. This, however, finds *direct* representation, as a rule, only in the comparatively infrequent emission dreams, while it often enough turns into an anxiety dream, which likewise leads to waking.

The symbolism of *dreams due to urethral stimulus* is especially obvious, and has always been divined. Hippocrates had already advanced the theory that a disturbance of the bladder was indicated if one dreamt of fountains and springs (Havelock Ellis). Scherner, who has studied the manifold symbolism of the urethral timulus, agrees that "the powerful urethral stimulus always turns into the stimulation of the sexual sphere and its symbolic imagery. . . . The dream due to urethral stimulus is often at the same time the representative of the sexual dream."

O. Rank, whose conclusions (in his paper on *Die Symbolschichtung im Wecktraum*) I have here followed, argues very plausibly that a large number of dreams due to urethral stimulus are really caused by sexual stimuli, which at first seek to gratify themselves by way of regression to the infantile form of urethral erotism. Those cases are especially instructive in which the urethral stimulus thus produced leads to waking and the emptying of the bladder, whereupon, in spite of this relief, the dream is continued, and expresses its need in

undisguisedly erotic images

In a quite analogous manner dreams due to *intestinal stimulus* disclose the pertinent sym bolism and thus confirm the relation which is also amply verified by ethno psychology of *gold* and *feces* Thus for example a woman at a time when she is under the care of a phy sician on account of an *intestinal disorder* dreams of a digger for hidden treasure who is burying a treasure in the vicinity of a little wooden shed which looks like a rural *privy* A second part of the dream has as its content how she *wipes* the *posterior* of her child a little girl who has *soiled herself*

Dreams of *rescue* are connected with partu rition dreams To rescue especially to rescue from the water is when dreamed by a woman equivalent to giving birth this sense i how ever modified when the dreamer is a man

Robbers burglars and ghosts of which we are afraid before going to bed and which some times even disturb our sleep ori inate in one and the same childish reminiscence They are the nightly visitors who have waked the child in order to set it on the chamber so that it may not wet the bed or have lifted the cover let in order to see clearly how the child is hold ing its hands while sleeping I hav h

ys the father the ghosts more probably correspond to fe male per ons in white ni ht gowns

F Examples—Arithmetic and Speech in Dreams

Before I proceed to assign to its proper place the fourth of the factors which control the formation of dreams I shall cite a few examples from my collection of dreams partly for the purpose of illustrating the co operation of the three factors with which we are already ac quainted and partly for the purpose of adduc ing evidence for certain unsupported assertions which have been made or of bringing out what necessarily follows from them It has of course been difficult in the foregoin account of the dream work to demonstrate my conclu sions by means of examples Examples in support of isolated tatements are convincing only when considered in the context of an in terpretation of a dream as a whole when they are wrested from their context they lose their value on the other hand a dream interpreta tion even when it is by no means profound soon becomes so extensive that it obscures the thread of the discussion which it is intended to illustrate This technical consideration must be my excuse if I now proceed to mix together all sorts of things which have nothing in com mon except their reference to the text of the foregoing chapter

We shall first consider a few examples of very peculiar or unusual methods of represen tation in dreams A lady dreamed as follows *A servant girl is standing on a ladder as though to clean the windows and has with her a chim pan ee and a gorilla cat* (later corrected *an gora cat*) *She th ows the animals on to the d eamer the chimpan ee nestles up to her and this is very disgusting* This dream has ac complished its purpose by a very simple means namely by taking a mere figure of speech lit erally and representin it in accordance with the literal meaning of its words *Monkey* like the names of animals in general is an opprobri ous epithet and the situation of the dream means merely *to hu l invectives* This same collection will soon furnish us with further ex amples of the employment of this simple arti fice in the dream work

Another dream proceeds in a very similar manner *A woman with a cl ild which has a conspicuously deformed cranium the d eamer l as hea d that tl e child acqu red th s defo mi ty owing to its position in its mother s womb Tl e doctor says tl at the cranium might be g ven a better sl ape by means of compression but that this would inju e the brain She thinks that because it is a boy it won t suffer so much from deformity* This dream contains a plastic representation of the abstract concept *Ch ld ish impressions* with which the dreamer has become familiar in the course of the treatment

In the following examp the dream work follows rather a different course The dream contains a recollect o of a curs on to the Hilm eich, near Graz *There is a terrib e s orm Outside a miserab e hot l—the wa er is dripping from the walls and the beds are damp* (The lat er part of the conte t was less d rectly expressed than I give it.) The dream s gnifies su er ous The abstract idea occurrin in the dream-thoughts is first made equivocal b a certain abuse f language t has pe haps been replaced by *overflowing* or by *fluid* and *super fluid* (*fluous*) and has then been brou ht to representation by a ccumulat on of like im pressions W ter within, water without water in the beds in the form of dampness—every thing fluid and *super* fluid. That f r the pur poses of dream-represent t on the spell is much less considered than the sound of words ought t to urprise when we remember that rhyme exercises a simila pri ilege

The f ct that language has t its disposal a great number of word whi h were riginally used in a pictorial and concrete sense but are at present used in a colourles and bstract fashi n, has in certain other cases mad it very easy fo the dream to represent ts thoughts. The dream has nl t rest re to these words their ful gnificance r to follow the change h k F example a

English example —Tr.

It would be a pecial undertaki g to col ect s ch methods of rep esentat o a d to arra ge them in accorda ce wi h the principles upon wh ch they are based. Some of the represen a tions are almost witty They gi e on the im press o that one would ha e never gues ed the r meanin if the dreamer h mself had no succeeded in expla ni g it.

1 A man dreams *that he is asked f r a nam wh ch however he can t ec l* He him elf explains th this means I s ldn't dream of t.

A female pat ent relates a dream in w ch *all the persons concerned were singularly large* That means h adds that it must deal with an episode of my early ch ldhood for at that time all grown-up people naturally seemed t me immensely large She herself d d not ppear i the dream.

The tra slat n i t childhood is expressed differently in other dreams—by the tran lat on of tim into space One sees perso s and cenes as tho h at a great di ta ce at the end of a lon road, r as though one were looking at them through the wrong end of a pa r of opera glasses

3 A man who in waking life hows an in clinat on to employ abstract a d od fin te e press o s but wh therwise has his w ts bout him dre ms certain connect on *th t he re hes railway st ion just as a t a n is com g B t then the platform moves towards the t ain which st nds stil* an absurd n ers on f the real stat of affairs Thi d tail aga n, s nothing more than an ind cation to the e ect that something else in the dream mu t be in erted The anal sis of th same dream le ds to rec llections f picture books in whi h men were represented standing o their head and walking on their hands.

4 Th sam dreamer n no her occa on relates a hort dream which almost recalls the techn qu of a rebus *His u le giv s h m a kiss in an a tom b e* He immed t ly adds the in terpretation which would never ha e occurred t m t means *a to-er t sm* In the waking state this might ha e been sa d in jest

5 At New Yea s E e dinn r the host the patria ch f the f mily u hered the New Yea with spee h. On of hi sons-i -law a lawye was t inclined to t k the ld m n sen sly especially when in the rse f his peech he expressed himself as f llows When I open the led r f the O d Yea and gla ce at its pages I see everything on the asset d and th n thank the Lord on the s d of lia

bility all you children have been a great *asset* none of you a *liability* On hearing this the young lawyer thought of X his wife s brother who was a cheat and a liar and whom he had recently extricated from the entanglements of the law That night in a dream he saw the New Year s celebration once more and heard the speech or rather saw it Instead of speaking the old man actually opened the ledger and on the side marked *assets* he saw his name amon st others but on the other side marked *liability* there was the name of his brother in law X However the word *liability* was chan ed into *Lie Ability* which he regarded as X s main characteristic

6 A dreamer *treats another person for a broken bone* The analysis shows that the frac ture represents a *broken marriage vow etc*

7 In the dream content the time of day often represents a certain period of the dream er s childhood Thus for example 5 15 a m means to one dreamer the age of five years and three months when he was that age a younger brother was born

8 Another representation of *age* in a dream *A woman is walking with two little girls there is a difference of fifteen months in their ages* The dreamer cannot think of any family of her acquaintance in which this is the case She herself interprets it to mean that the two children represent her own person and that the dream reminds her that the two traumatic events of her childhood were separated by this period of time (3/ and 4¾ years)

9 It is not astonishing that persons who are undergoing psycho analytic treatment frequent ly dream of it and are compelled to give expression in their dreams to all the thoughts and expectations aroused by it The image cho en for the treatment is as a rule that of a journey usually in a motor car this being a modern and complicated vehicle in the refer ence to the speed of the car the patient s iron ical humour is given free play If the *uncon scious* as an element of wakin thought *is* to be represented in the dream it is replaced ap propriately enough by *subterranean* localities which t other times when there is no refer ence to analytic treatment have represented the female body or the womb *Below* in the dream very often refers to the genitals and its opposite *above* to the face mouth or breast By *wild beasts* the dream work usually sym bolizes pas ionate impulses tho e of the dream er and also those of other persons of whom th dreamer is afraid or thus by means of a very slight displacement the per ons who experi ence these passions From this it i not very fa to the totemi tic representation of the dreaded *father* by means of vicious animals do s wild horses etc One might say that wild be sts serve to represent the *libido* feared by the ego and combated by repression Even the neurosis itself the *sick person* is often separated from the dreamer and exhibited in the dream as an independent person

One may go so far as to say that the dream work makes use of all the means acce ible to it for the visual representation of the dream thou hts whether these appear dmissible or inadmissible to wakin criticism and thus ex poses itself to the doubt as well as the derision of all those who have only hearsay knowled e of dream interpretation but have never them selves practised it Stekel s book *Die Sprache des Traumes* is especially rich in such examples but I avoid citing illustrations from this work as the author s lack of critical judgment and his arbitrary technique would make even the unprejudiced observer feel doubtful

10 From an essay by V Tausk (*"Kleider und Farben im Dienste der Traumdarstellung in Interna Zeitschr fur Ps A ii* [1914])

(a) A dreams that *he sees his former gov erness wearing a dress of black lustre which fits closely over her buttocks* That means he declares this woman to be *lustful*

(b) C in a dream *sees a gi l on the road to X bathed in a white light and wearing a white blouse*

The dreamer be an an affair with a Miss White on this road

11 In an analysis which I carried out in the French language I had to interpret a dream in which I appeared as an elephant I naturally had to ask why I was thus represented *Vous me trompe* answered the dreamer (*Trompe = trunk)*

The dream work often succeeds in represent ing very refractory material such as proper names by means of the forced exploitation of very remote relations In one of my dreams *old Brucke has set me a task I make a prepa ration and pick something out of it which looks like c umpled tinfo l* (I shall return to this dream later) The correspondin association which is not easy to find is *stanniol* and now I know that I have in mind the name of the author *Stan nius* which appeared on the title page of a treatise on the nervous system of

Repo t d by Br'll a h *F d r t I C pt s of Psy h lys*

fishes, which in my youth I regarded with reverence. The first scientific problem which my teacher set me did actually relate to the nervous system of a fish—the *Ammocoetes*. Obviously this name could not be utilized in the picture-puzzle.

Here I must not fail to include a dream with a curious content, which is worth noting also as the dream of a child, and which is readily explained by analysis. A lady tells me: "I can remember that when I was a child I repeatedly dreamed that *God wore a conical paper hat on His head*. They often used to make me wear such a hat at table, so that I shouldn't be able to look at the plates of the other children and see how much they had received of any particular dish. Since I had heard that God was omniscient, the dream signified that I knew everything in spite of the hat which I was made to wear."

What the dream-work consists in, and its unceremonious handling of its material, the dream-thoughts, may be shown in an instructive manner by the numbers and calculations which occur in dreams. Superstition, by the way, regards numbers as having a special significance in dreams. I shall therefore give a few examples of this kind from my collection.

1. From the dream of a lady, shortly before the end of her treatment:

She wants to pay for something or other; her daughter takes 3 florins 65 kreuzer from her purse; but the dreamer says: "What are you doing? It only costs 21 kreuzer." This fragment of the dream was intelligible without further explanation, owing to my knowledge of the dreamer's circumstances. The lady was a foreigner who had placed her daughter at school in Vienna, and was able to continue my treatment as long as her daughter remained in the city. In three weeks the daughter's scholastic year would end, and the treatment would then stop. On the day before the dream the principal of the school had asked her whether she could not decide to leave the child at school for another year. She had then obviously reflected that in this case she would be able to continue the treatment for another year. Now, this is what the dream refers to, for a year is equal to 365 days; the three weeks remaining before the end of the scholastic year and of the treatment, are equivalent to 21 days (though not to so many hours of treatment). The numerals which in the dream-thoughts refer to periods of time are given money values in the dream, and simultaneously a deeper meaning finds expression—for *time is money*. 365 kreuzer, of course, are 3 *florins* 65 *kreuzer*. The smallness of the sums which appear in the dream is a self-evident wish-fulfilment; the wish has reduced both the cost of the treatment and the year's school fees.

2. In another dream the numerals are involved in even more complex relations. A young lady who has been married for some years learns that an acquaintance of hers of about the same age, Elise L, has just become engaged. Thereupon she dreams: *She is sitting in the theatre with her husband, and one side of the stalls is quite empty. Her husband tells her that Elise L and her fiancé had also wanted to come to the theatre, but that they had only obtained poor seats, three for 1 florin 50 kreuzer, and of course they could not take those. She thinks they didn't lose much there.*

What is the origin of the 1 *florin 50 kreuzer*? A really indifferent incident of the previous day. The dreamer's sister-in-law had received 150 florins as a present from her husband, and hastened to get rid of them by buying some jewellery. Let us note that 150 florins is 100 times 1 florin 50 kreuzer. But whence the 3 in connection with the seats in the theatre? There is only one association for this, namely, that the fiancée is three months younger than herself. When we have ascertained the significance of the fact that one side of the stalls is empty we have the solution of the dream. This feature is an undisguised allusion to a little incident which had given her husband a good excuse for teasing her. She had decided to go to the theatre that week; she had been careful to obtain tickets a few days beforehand, and had had to pay the booking-fee. When they got to the theatre they found that one side of the house was almost empty; so that she certainly *need not have been in such a hurry*.

I shall now substitute the dream-thoughts for the dream: "It surely was nonsense to marry so early; there was *no need for* my being in such a hurry. From Elise L's example I see that I should have got a husband just the same—and one a *hundred times* better—if I had only waited (antithesis to the *haste* of her sister-in-law). I could have bought *three* such men for the money (the dowry)!"—Our attention is drawn to the fact that the numerals in this dream have changed their meanings and their relations to a much greater extent than in the one previously considered. The transforming and distorting activity of the dream has in this case been greater—a fact which we interpret

as meaning that these dream thou hts had to overcome an unusual degree of endo psychic resistance before they attained to representa tion And we must not overlook the fact that the dream contains an absurd element name ly that *two* persons are expected to take *three seats* It will throw some light on the question of the interpretation of absurdity in dreams if I remark that this absurd detail of the dream content is intended to represent the most strong ly emphasized of the dream thoughts It was *nonsense* to marry so early The figure 3 which occurs in a quite subordinate relation be tween the two persons compared (three months difference in their ages) has thus been adroit ly utilized to produce the idea of nonsense re quired by the dream The reduction of the actual 150 florins to 1 florin 50 kreuzer cor responds to the dreamer s disparagement of her husband in her suppressed thou_hts

3 Another example displays the arithmet ical powers of dreams which have brought them into such disrepute A man dreams *He is sitting in the B s house* (the B s are a fami ly with which he was formerly acquainted) *and he says It was nonsense that you didn t give me Amy for my wife Thereupon he asks the girl How old are you? Answer I was born in 188 Ah then you are 8 years old*

Since the dream was dreamed in the year 1898 this is obviously bad arithmetic and the inability of the dreamer to calculate may if it cannot be otherwise explained be likened to that of a general paralytic My patient was one of those men who cannot help thinking about every woman they see The patient who for some months came next after him in my con sulting room was a young lady he met this lady after he had constantly asked about her and he was very anxious to make a good im pression on her This was the lady whose age he estimated at 28 So much for explaining the result of his apparent calculation But 188 was the year in which he had married He had been unable to refrain from entering into con ver ation with the two other women whom he met at my house—the two by no means youth ful maid who alternately opened the door to him—and as he did not find them very respon sive he had told himself that they probably regarded him as elderly and *se ious*

Bearing in mind these examples and others of a similar nature (to follow) we may say The dream work does not calculate at all whether correctly or incorrectly it only strings together in the *form* of a sum numerals which occur in the dream thoughts and which may serve as allusions to material which is insus ceptible of representation It thus deals with figures as material for expressing its intentio_s just as it deals with all other concepts a_d with names and speeches which are only verb_l images

For the dream work cannot compose a new speech No matter how many speeches and an swers which may in themselves be sensible or absurd may occur in dreams analysis shows us that the dream has merely taken from the dream thoughts fragments of speeches which have really been delivered or heard and h_s dealt with them in the most arbitrary fashion It has not only torn them from their context and mutilated them accepting one fragment and rejecting another but it has often fitted them to ether in a novel manner so that the speech which seems coherent in a dre m is dis solved by analysis into three or four compo nents In this new application of the words the dream has often ignored the meaning which they had in the dream thoughts and has drawn an entirely new meaning from them Upon closer inspection the more distinct and com pact in redients of the dream speech may be distinguished from others which serve as con nectives and have probably been supplied ju t as we supply omitted letters and syllables in readin^g The dream speech thus has the struc ture of *breccia* in which the larger pieces of various material are held together by a oli dified cohesive medium

Strictly speaking of course this description is correct only for those dream speeches which have something of the sensory character of a speech and are described as *speeches* The others which have not as it were been per ceived as heard or spoken (which have no ac companying acoustic or motor emphasis in the

A ly f th me c l d m h bee g by J M c w k d th S h d fte l ry ompl t d ithm t cal pers t s wh h e th l s s l ed by th d eam w th to h g o f d Cf also Ernest J e *Über u beu t Z hl b l dl g Z t lb l P y k ly* 4 (9] p 24) N beh es the m f h I k w a p t t wl o—l l t ly d ll gly—h rs (h ll c t) f m g bl l f Sh th t by l th l Ot

dream) are imply thoughts ch as ccur in w king life and find their way uncha ged into many of our dreams Ou read n too seems to pro d an ab da t and n t ea ily traceable ource for the ind fferent speech ma terial f dreams. But a ythi g that is at all con sp cuous as a spee h n d eam can be ref rred to actual speeches which ha e bee made or heard by the dreamer

We ha e already found examples of the d i at on of such d am speeches in the analyses f dreams which have been c ted fo other pur poses. Thus n the *innoce t ma ket-d e m* (p. 213) where the speech *That s no long to be h d* serves to ident fy me with the butcher hile a fragment of the other speech *I do t k ow th t I d n't t ke that* precisely fulfils the ta k of rend ring the dream innocent On *th* prev o s day the d eamer reply to s me unrea onable demand o the part of her cook had wa ed h as de with the wo ds *I don't k ow that b have urs lf p op ly* and sh aft rwards took into th d m the first, and f f re t sounding part f th pe h in orde to al ud t the latte part which fitted well in t the phanta y unde lying the d eam but wh h m ght al o ha e betra ed it

Here s ne of ma examples whi h all lead t the sam c l n

A la ge courtya d wh cl d d bodies a e being burned Th d amer s I'm going I t s and the sight of t (Not a distinct spee h.) *Then he meet two b t her boys d ask B ll did it taste go d? A d one of th m answer N t w sn t g od A tho gh t had been h man flesh*

Th innocent cca of this d eam is a f llows After taki g supper with his wif the dreamer pays t t his w rthy b t by n m ans *app t g ghb* The hosp table ld lady s) t tti g down t h own upper and pr s him (am g m mpo te sexually g ifica t w rd used joco ly in the pla f this w d) to t te it H d clines say that he has o appet te She replies *G on with you you m ge t all right som thing f th ki d* The d eame is thus fo ed t tast and pra what ff ed him. B t that s good! Whe he is l e again with his wife h mplai s of hi n ghbour s mportunity and f the quality of the food whi h he ha tasted I can t tand th ght f it a phra that the d eam too does t m rg a actual spee h, is thou ht rel t t the phys cal harms f the l dy wh nv tes him which may be translated by th statement that he has no de ire to look at her

The analys s of another dre m—wh ch I will c te at this stage for the sake of a very d s tinct speech which con titutes its nucleus but wh ch w ll be explained only when we come to evaluate the affects in dreams—is more instruc t e I dream very vividly *I have gone to Br cke s labo atory at night and on hear g a ge le knock g at the doo I open it to (the deceased) P ofessor Fleischl who e te s n the compa y of seve al st a ge s and after say g a fe words s s down at his table* Then follows a econd dream *My frie d Fl has come to V enna u obtrusively in July I me t h m i the st eet n conve satio w th my (deceased) frie d P a d I go with them somewher a d th y s t down facing each other as though at a sm ll table while I sit faci g them at the na ow end of the table Fl speaks of h s s ster a d says I th ee-qua ters of an ho she was d ad and then som thing l ke That is the*

The scene in which I annihilate P with a glance forms the centre of the dream His eyes become strange and weirdly blue and then he dissolves This scene is an unmistakable imitation of a scene that was actually experienced I was a demonstrator at the Physiological Institute I was on duty in the morning and Brucke learned that on several occasions I had been unpunctual in my attendance at the students laboratory One morning therefore he arrived at the hour of opening and waited for me What he said to me was brief and to the point but it was not what he said that mattered What overwhelmed me was the terrible g ze of his blue eyes before which I melted away—as P does in the dream for P has exchanged roles with me much to my relief Anyone who remembers the eyes of the great master which were wonderfully beautiful even in his old age and has ever seen him angered will readily imagine the emotions of the young transgressor on that occasion

But for a long while I was unable to account for the *Non vixit* with which I pass sentence in the dream Finally I remembered that the reason why these two words were so distinct in the dream was not because they were heard or spoken but because they were *seen* Then I knew at once where they came from On the pedestal of the statue of the Emperor Joseph in the Vienna Hofburg are inscribed the following beautiful words

Saluti patriae vixit
non diu sed totus

From this inscription I had taken what fitted one inimical train of thought in my dream thou hts and which was intended to mean That fellow has nothin to say in the matter he is not really alive And I now recalled that the dream was dreamed a few days after the unveilin of the memorial to Fleischl in the cloisters of the University upon which occasion I had once more seen the memorial to Brucke and must have thought with regret (in the unconscious) how my gifted friend P with all his devotion to science had by his premature death forfeited his just claim to a memorial in these halls So I set up this memorial to him in the dream Jo ef is my friend P s baptismal name

According to the rules of dream interpretation I should still not be justified in replacing *non vivit* which I need by *non vixit* which is placed at my disposal by the recollection of the Kaiser Josef memorial Some other element of the dream thoughts must have contributed to make this possible Somethi

t

c the other affectionate—the former on the surface the latter covered up—and both are given representation in the same words *non vixit* As my friend P has deserved well of science I erect a memorial to him as he has been guilty of a malicious wish (expres ed at the end of the dream) I annihilate him I have here constructed a sentence with a special cadence and in doing so I must have been influenced by some existing model But where can I find a similar antithesis a similar parallel between two opposite reactions to the same person both of which can claim to be wholly justified and which nevertheless do not attempt to affect one another? Only in one pa sage wh h h

tificatior

Caesar I eu me I weep for him as he was fortunate I rejoice at it as he was valiant, I honour him but as he was ambitious I slew him Have we not here the same verbal structure and the same antithesis of thought as in the dream thoughts? So I am playin Brutus in my dream If only I could find in my dream thoughts another collateral connection to confirm this! I think it might be the followin *My friend Fl comes to Vienna in July* This detail is not the case in reality To my knowledge, my friend has never been in Vienna in July But the month of *July* is named after *Jul us Caesar* and might therefore very well furnish the required allusion to the intermediate thought—that I am playing the part of Brutu

Stran ely enough I once did actually play the part of Brutus When I was a boy of fourteen I presented the scene between Brutus and Caesar in Schiller s poem to an audience of children with the assistance of my nephew who was a year older than I and who had come to us from England—and was thus a *revenant*—

According to the prevailing tandards of dream-critic m this dream-co tent would be expla ed as f llows At first while the dreamer is p cturing his father s acc dent he has f r gotten that his father has already been many years in his grave in the c rse of the dream this *memory* awakens o that he is urpri ed at h s own dream even wh le he is dre m g it Analy s *however tells us that it is quite su pe fluous* o seek for such expl nat ons The d eame had comm s oned a sculptor to make a *bust* of his father and he had in pected the bu t two d ys bef re the dream It is this wh ch eems to h m to ha e come to grief (the Ger man w rd means *go e wro g* or *met with an ccide t*) The sculptor has never een his fath er and has had to work from ph tographs On the very d y before the dream the son had ent an ld family servant to the studio in order *to see whether he too would pass the same* j dgment upo the marble bu t—namely that it was *too narrow b tw en the temples* And n w follows the memory material which has c tributed to the format on of the dream The d eamer s father had a hab t whenever he was haras ed by bus es cares or d mestic difficult es of pressing h s temples between his hands as thou h h s head was growing too large and he was trying to compress t When the d eamer was four years old he was p esent when a p stol was acc dent lly d ha ged and his f thers eye we e bl k ed *(h s eyes a e so cl ar)* When h s father was thou htf l or d p es d he had a deep furrow n h s fore head j t where the dream hows h s wou d The fact that in the dream th wr kle is re plac d by a w und po ts t the se d occa

for th d eam Th dream r had t k n a pl o graph of his little daughte the plate had fall n f m his ha d and when he p ked t up it revealed a crack wh ch ran l ke a verti

the photograph and the original We are all accustomed to making remarks like Don t you think it s exactly your father? Th - ance f h have to for ugie case might be tempted to say that this semblance of absurdity is admitted or even desired

II

Here is another example of the same kind from my own dreams (I lost my father in the year 1896)

After his death my father has played a part in the political life of the Magyars and has united them into a political whole and here I see indistinctly a little picture *a number of men as though in the Reichstag a man is standing on one or two chairs there are others round about him I remember that on his death bed he looked so like Garibaldi and I am glad that this promise has really come true*

Certainly this is absurd enou h It was dreamed at the time when the Hungarians were in a state of anarchy owing to P

u trivial circumstance that the scenes beheld in dreams consist of such little pictures is not without significance for the elucidation of this element The cu tomary visual dream representations of our thoughts present images that impress us as being life size my dream picture however is the reproduction of a wood cut inserted in the text of an illustrated history of Austria representing Maria Theresa in the Reichstag of Pressburg —the famous scene of *Moriamur pro rege nostro* Like Maria Theresa my father in my dream is surrounded by the multitude but he is standing on one or two chairs *(Stuhlen)* and is thus like a *Stuhlrichter* (presiding judge) (He has *united* them here the intermediary is the phrase We shall need no *judge*) Those of us who stood about my father s death bed did actually notice that he looked very like Garibaldi He had a *post mortem* rise of temperature his cheeks shone redder and redder involuntarily we continue And behind him in unsubstantial (radiance) lay that which subdues us all—the common fate

This uplifting of our thou hts prepares us for the fact that we shall have to deal with this *common fate* The *post mortem* rise in temperature corresponds to the word *after his death* in the dream content The most agonizing of his afflictions had been a complete paraly s of the intestines (*obstruction*) during the last few weeks of his life All sorts of disrespectful thou hts associate themselves with this One of my contemporaries who lo t his father while still at the *Gymnasium*—upon which occasion I was profoundly moved and tendered him my friendship—once told me derisively of the distress of a relative whose father had died in the street and had been brou ht home when it appeared upon undressing the corpse that at the moment of death or *post-mortem* an evacuation of the bowels (*Stuhlentleerung*) had taken place The dau hter was deeply distressed by this circumstance because this u ly detail would inevitably spoil her memory of her father We have now penetrated to the wish that is embodied in this dream To stand after one s death before one s children great and undefiled who would not wish that? What now has become of the absurdity of this dream? The appearance of absurdity was due only to the fact that a perfectly permissible figure of peech in which we are accustomed to ignore any absurdity that may exist as between its components has been faithfully represented in the dream Here again we can hardly deny that the appearance of absurdity is desired and has been purposely produced

The frequency with which dead persons appear in our dreams as living and active and associating with us has evoked undue astoni h ment and some curious explanations which afford conspicuous proof of our misunderstand in of dreams And yet the explanation of these dreams is close at hand How often it happens that we say to ourselves If my father were still alive what would he say to this? The dream can express this *if* in no other way than by his presence in a definite situation Tha for instance a young man whose grandfather has left him a great inheritance dreams that the old man is alive and calls his grand on to account reproaching him for his lavish expenditure What we regard as an objection to the dream on account of ou better knowledge that the man is already dead is in real ty the consoling thought that the dead man does not need to learn the truth or satisfaction over the fact

[W d f k] I h f tt wh t uth I f d f i d m wh h w ru w th lly sm ll fig th f h h p d t be f th g g I J q C ll t wh h th d m r h d m d d th d y Th e gra gs co ta m mbe f v ry sm ll figu es a wh l s f th m d l w th th ho o s of the Th ty Y rs W

that he can no longer have a say in the matter

Another form of absurdity found i dreams f deceased relati es does not express scorn and derision it serves to express the extremest re pudi tion, the repre entat n of a suppressed thou ht which one would like to bel eve the very last thing one would think of Dreams of this kind ppear to be capable of olution only if we remember that a dream makes no distinction between des re and reality For ex ample a man who n rsed his father during his last illness and who felt his death very keenly dreamed some time afterwards the fol lowing senseless d eam *His father was aga n living and conversi g with h m as usual but* (and this was the remarkable thing) *he had* h d d t *know it*

it we dd *that the d e me had e teri ed this w h* While rs g him th son had often wished that his fathe was dead that i he had had th eally compass onate th ught that it would be a good thing f death would at last put an end to his s fferings. Whil b was m urning his fath s d ath even this com pas nate wish became uncon c ous re proach as tho gh t had eally co tributed to shorten th s ck ma s life By the awakeni g of the earliest infantile f lings against his fathe t became po sibl to expre s this re proach as a dream and it was p ecisely be cause of the extreme antithesi between the dream instigat and the day tho ghts that this dream had to ssume s bsurd a form

As g eral thi g th dream of a deceased perso of whom th d eame has been fond conf ont the interpreter with difficult p blem the s luti f which is not alw ys satisfyin Th eas for thi may be sought in the es pecially p ono d amb valence of feeling whi h controls the r lat of th d eame to the dead person. In such dream it is quite usual fo the d eased person to be treated at first as li ing th t dd nly appears that he is d d and in the c ti uat o f th d eam he is once more liv g This has a co fusing ef fect. I t last divin d that this alternat f death and life t ded to epresent the *in d fe en* f th dream (It is ll o e to me h th h al e o dead) Thi indifferen f urse, is not eal b t wished ts purpo is to help the dream r t deny hi ry intense and often contradictory emot onal attitudes and so it becomes the dream representation of his *amb vale ce* F r other dreams in wh ch one meets with deceased persons the following rule will often be a guide If in the dream the dreamer *is not reminded that the dead person* — f n m with the dead eal it he this ident ficat on and rejects the meaning ut the dreamer is de d But I will admit that I feel that dream interpretation is far from having elic ted all the secrets of dreams having this content

III

In the example which I shall now cite I can detect the dream work in the act of purposely manufacturi g an absurdity for which there is no o cas on whatever in the dream material. It is taken from the dream which I had as a re sult of meeti g Count Thun just before go ng — — h l

proached me s tho gh I had worn h m out at the same t me t seems as though I had al eady made with h m a journey that one usually — —

to a remote street i Dornbach. The d iver however did not know the way and s mply kept driving in the mann r of such worthy people unt l I became awa e of the fact and sh wed him the way dulgi g in a few deri s e rem ks From this dr r a train of thought led to the arist cratic personage whom I was to meet later on For the present I will only rem k that o e thing that strikes us mid-dle-class plebeian about the ristocracy is that they lik to put themselves in the dri e s seat. *Does not Count Th gu de the Au tri n car of State?* The next sente c in the d eam h w eve f rs t my b the wh m I thus also *identify w th th* cab-dri r I had refused to go to Italy with him this ye r *(Of cou se I* th d eam unchanged) by ru hing him too quickly from pla e t place d maki g him see too ma y be tiful thi g in a singl day That evening my b oth had accompanied me

Cf F rm lations regardin th Two Principles in Mental Functioning, C lle ted P per IV

to the railway station but shortly before the carriage had reached the Western station of the Metropolitan Railway he had jumped out in order to take the train to Purkersdorf I suggested to him that he might remain with me a little longer as he did not travel to Purkersdorf by the Metropolitan but by the Western Railway This is why in my dream I made in the cab a journey which one usually makes by train In reality however it was the other way about what I told my brother was The distance which you travel on the Metropolitan Railway you could travel in my company on the Western Railway The whole confusion of the dream is therefore due to the fact that in my dream I replace Metropolitan Railway by *cab* which to be sure does good service in brin ing the driver and my brother into conjunction I then elicit from the dream some nonsense which is hardly disentangled by elucidation and which almost constitutes a contradiction of my earlier speech *(Of course I can not drive with you on the railway track itself)* But as I have no excuse whatever for confronting the Metropolitan Railway with the cab I must intentionally have given the whole enigmatical story this peculiar form in my dream

But with what intention? We shall now learn what the absurdity in the dream signifies and the motives which admitted it or created it In this ca e the solution of the mystery is as follows In the dream I need an absurdity and something incomprehensible in connection with *driving* (*Fahren*=riding driving) because in the dream thoughts I have a certain opinion that demands representation One evening at the house of the witty and hospitable lady who appears in another scene of the same dream as the *housekeeper* I heard two riddles which I could not solve As they were known to the other members of the party I presented a somewhat ludicrous figure in my unsucce sful attempts to find the solutions They were two puns turning on the words *Nachkommen* (to obey orders—offspring) and *Vorfahren* (to drive—forefathers ancestry) They ran I believe as follows

> *The coachman does it*
> *At the master's behests*
> *Everyone has it*
> *In the grave it rests*
> *(Vorfah en)*

A confusing detail was that the first halves of the two riddles were identical

> *The coachman does it*
> *At the master's behests*
> *Not everyone has it*
> *In the cradle it rests*
> *(Nachkommen)*

When I saw Count Thun drive up *(vorfahren)* in state and fell into the Figaro like mood in which one finds that the ole merit of s ch aristocratic gentlemen is that they have taken the trouble to be born (to become *Nachkommen)* these two riddles became intermediary thoughts for the dream work As aristocrats may readily be replaced by coachmen and s nce it was once the custom to call a coachman *Herr Schwager* (brother in law) the work of con den ation could involve my brother in the ame representation But the dream thought at work in the background is as follows It is nonsen to be proud of one s ancestors *(Vorfahren)* I would rather be an ancestor *(Vorfahr)* my self On account of this opinion *it is nonsense* we have the nonsense in the dream And now the last riddle in this obscure pas a e of the dream is solved—namely that I have driven before *(vorher gefahren vorgefahren)* with this driver

Thus a dream is made absurd if there occurs in the dream thoughts as one of the elements of the contents the opinion That is nonsense and in general if criticism and derision are the motives of one of the dream er s unconscious trains of thought Hence absurdity is one of the means by which the dream work represents contradiction another means is the inversion of material relation between the dream thoughts and the dream-content another is the employment of the feelin of motor inhibition But the absurdity of a dream is not to be translated by a simple *no* it is intended to reproduce the tendency of the dream thoughts to express laughter or derision simultaneously with the contradiction Only with this intention does the dream work produce anything ridiculous Here again it transforms a part of the latent content into a manifest form

As a matter of fact we have already cited

H th d m wo k p d the th ght wh ch It q l fi s s d cul r d l wh h f B

Her L dw g i t gr er P t
U d gt er t t Ap ll
V hm l d K nd b it t nd fl ht

a convincing example of this simulacre of an absurd dream. Th dream (in pre ed wi hout nalysis) of the Wagnerian performan e which lasted until 4 a.m., and in wh ch th orchestra is conducted from a tower etc (ee p 8) is obviously saying It i a crazy world and an insane society He who deserves a thin doesn t get and he who doesn t care for it does get it. In this way the dreamer compares her fate with that of her cousin. The f ct that dreams of a dead f ther were the first to furnish us with examples f bsurdity in dreams is by no means accidental. The condi ions fo the crea ion of absurd dreams are h re grouped together in a typical fashion. The authority proper to the father has an earl evoked the criticism f the child, and the trict demands which he has made ha caused th child, in self-defence t pay particularly close ttent on to every weakness f his f the but the p ety with which th f ther s personality is surrounded in our thoughts especially ft r his death inten sifies the censorship which prevent the expression f this criticism f om becoming conscious

IV

H re is another abs d dream f deceased father

I eive a communic tion f om the town council f my n t e city concerning the cost of accommodation in the h spi al the year 185 This was nec ss ted by seizure f om wh h I was sufferi g I make f of the m t ter for in the first pla e I was ot yet born in 185 and in th se ond plac my f ther to whom th commun on w ght efer is al ready dead I g to h m in the adjoin g oom wher he is lying in b d and t ll h m about T my surpri h members that in the year 185 h was on d k and had to be lock d p or confined It wa when he was working for th firm of T Then you t us d to drink? I ask 1 married soon after? I ckon that I was b rn in 856 wh h eems to me t be imm diat ly afterwards

In the light of th f regoing xposition we shall translate th insistence with whi h thi dream xh b ts ts bsurdities as ure gn f particularly embittered and pa onat polemi in the dream thoughts All the grea er then is ur onishment when we perceive that this dream the polemic is wa ed penly and that my f the is denoted a th person who made h laughing-stock. S ch frankness seems to contradict ur assumption of a censor sh p co tro in the dream work. The explana t on is that here the father is only an i ter posed figure while the quarrel is really with anoth r person who ppears in the dream only in a le allu on Whereas a dream u ually treats of revolt against other persons behind whom the father is concealed here it is the other way abou the father serves as th man of traw to represent another and hence the dream dares to co cern i self openly w h a person who is usually hallowed because th re is present the certa n knowledge that he is n t in reality intended W learn of this condition of affairs by cons dering the occa on of the dream It was dreamed after I had heard that an olde colleague whose judgment was con dered infallible had expressed disapproval and as onishment on hearing tha one of my pa ents had already been undergoing psycho-analyt c treatmen at my ha d for f e years. Th introductory sentences of the dream al ude in transpare tly di guised man er to the fact that this colleague had f a time taken over the duties whi h my f ther could no longer perform (statement of expenses accommoda tion n the hosp tal) and when our friendly re lations began to al er for th worse I was thrown into the same emotional conf t as th t whi h arises in the case of a m nder st ding between fath r and son (by reason of the part pla ed by th father and hi ea lier funct ons) The dream thoughts now b tterly resent the reproach that I am not making better progress which xtends tself from the treatment of this patient t other things. Does my colleague know an one who can get on any faster? Does he not know that cond tions of this sort are usually incurable and last f life? What are four or five years in compari on to a whole lifetime especially when life has been made so much ea er for th patient during the treatment?

The mpression of absurdity in this dream is brought about largely by the f ct that sen t ces f m diff rent di is ons of the dream th ughts ar strung tog ther without any reconcilin trans tion. Thus the sentence *I go to h m in th djoining om* etc., lea s the subject f om which the preceding sentences are taken and faithfully reprod ces the ci cum tances under which I told my father that I was engaged t be married Thus the dream s trying t remind m of the ob dis t rested ness which the old man showed t that tim and to co trast this with the conduct f an

other newly introduced person I now perceive that the dream is allowed to make fun of my father because in the dream thoughts in the full recognition of his merits he is held up as an example to others It is in the nature of every censorship that one is permitted to tell untruths about forbidden things rather than the truth The next sentence to the effect that my father remembers that he was *once drunk* and was *locked up* in consequence contains nothing that really relates to my father any more The person who is screened by him is here a no less important personage than the great Meynert in whose footsteps I followed with such veneration and whose attitude towards me after a short period of favouritism changed into one of undisguised hostility The dream recalls to me his own statement that in his youth he had at one time formed the habit of *intoxicating himself with chloroform* with the result that he had to *e it*

A

... r ference to masculine hysteria the existence of which he denied and when I visited him during his last illness and asked him how he felt he described his condition at some length and concluded with the words You know I have always been one of the prettiest cases of masculine hysteria Thus to my satisfaction and to my astonishment he admitted what he so long and so stubbornly denied But the fact that in this scene of my dream I can use my father to screen Meynert is explained not by any discovered analogy between the two persons but by the fact that it is the brief yet perfectly adequate representation of a conditional sentence in the dream thoughts which if fully expanded would read as follows Of course if I belonged to the second generation if I were the son of a professor or a privy councillor I should have pro ressed more rapidly In my dream I make my father a professor and a privy councillor The most obvious and most annoying absurdity of the dream lies in the treatment of the date 1851 which seems to me to be indistinguishable from 1856 *as thougl a d fference of five years meant notl ing whatever* But it is just this one of the dream thoughts that requires expression Four or five years—that is precisely the length of time during which I enjoyed the support of the colleague mentioned at the outset but it is also the duration of time I kept my fiancee waiting before I married her and by a coincidence that is eagerly exploited by the dream thoughts it is also the time I have kept my oldest patient waitin for a complete cure What are five years? ask the dream thou hts *That is no time at all to me that isn t worth consideration* I have time enough ahead of me and just as what you wouldn't believe came true at last so I shall accomplish this also Moreover the number 51 when considered apart from the number of the century is determined in yet another manner and in an opposite sense for which reason it occurs several times over in the dream It is the age at which man seems particularly expo ed to danger the age at which I have seen colleagues die suddenly amon them one who had been appointed a few days earlier to a profes orship for which he had lon been waiting

V

Another absurd dream which plays with figures

An acquaintance of mine Herr M has been attacked in an essay by no less a person than Goethe and as we all think with unjustifiable vehemence Herr M is of course crushed by this attack He complains of it bitterly at a dinner party but his veneration for Goethe has not suffe ed as a result of this personal experience I try to elucidate the temporal relations a l ttle as they seem improbable to me Goethe died in 183 since his attack upon M must of course have taken place earl r M was at the time quite a young man It seems plausible to me that l e was 18 years old But I do not know exactly what the date of the present year is and so the whole calculation lapses into obscurity The attack by the way is contained in Goethe s well known essay on Nature

We shall soon find the means of justifying the nonsense of this dream Herr M with whom I became acquainted *at a d nner party* had recently asked me to examine his brother who showed signs of *gene al paralysis* The conjecture was right the painful thing about this visit was that the patient gave his brother away by alluding to his *youthful pranks* thou h our conversation gave him no occasion to do so I had asked the patient to tell me the year of his birth and had repeatedly got him to make trifling calculations in order to show the weakness of his memory—which tests by the way he passed quite well Now I can see that I behave like a paralytic in the dream (*I do not know exactly wl at the date of the present year is*) Other material of the dream is drawn from another recent source The editor of a medical

periodical, a friend of mine had accepted for his paper a very unf vourab e crush g rev ew of the L t book f m Be lin friend, Fl, the critic being a very you hful reviewer who was not very competent t pass j dgment I thought I had a right to interfere and called the edi o t account he greatly regretted his acceptance of the review but he would not promise a v redress I thereupon broke off my relations with the periodical, and in my letter of resi nation I expressed the hope that *our personal relations would no suffer* as a result of the in cident. The third source of this dream is an ac count given by a female patient—it was fresh in my memory t the time—of the psychosis of her brother who had fallen in o a frenzy cry ing *Nature Nature* The p ysicians in at tendance thought that the cry was derived from a reading of Goethe s beautiful *essay* and that it pointed to the patient s overwork in the study of natural philosophy I th ught, rather of the sexual meaning in which even our less cultured peopl use the word *Nature* and the f ct that the unfortunate man afterwards mu tilated his genitals seems to how that I was not far wrong Eighteen years was the age of this patient t the tim f this a cess of frenzy

If I add, further that the book f my so severely criticized friend (One asks oneself whether the uthor or oneself is crazy had been the opinion f another criti) treats of the *temporal cond ions* f life d refers the duration f Goethe lif t th mul ple f a number significant from the b logical point of view it will readily be admitted that in my dream I am putting myself in my friend s place. (*I try t el cid th t mporal lations a lit tle*) But I behave like paretic, and the dream revels in absurdity This means that the dream thoughts say ironically Naturally he is the fool, t lunatic, and you are the clever people who know bette Perhaps however it is the other way bout Now *th other way about* is abundantly *represented in my dream,* inas much as Goethe has tt cked the young man, which is bsurd, while t is perfectly possible even today f young fellow t ttack the imm rtal Goeth and inasmuch as I reckon *from the year f Goethe' d ath* while I mad the paretı reckon from the *year of his birth*

But I ha e further promised t show that no dream is inspired by ther than egoistical mo tives. Accordingly I must ccount for the f ct that in this dream I mak my friend's cause my own, and put myself in his place My criti cal conv ction in waking life would not justify my d g so Now the story of the eigh een year-o d patient, a d th divergent interpreta tions of his cry *Nature* all de to the fact that I ha e put m self in o oppos tion t the maj rity of phys cians by claiming a sexual aetiology for the psychoneuroses I may say to myself You will meet with the ame ki d of crit cism as our friend indeed you ha e al ready done so to some extent so that I may now replace the *he* in th dream-thoughts by *we* "Yes, you are right we two are the foo s That *mea res ap ar s* clea ly hown by the mention of the hort incomparably beautiful essay of Goethe s for it was a popular lecture on this essay which induced me to tud the natural ciences when I l ft the G mnasium, and was till undecided as to my future

VI

I have to show that yet another dream in which my ego does not appear is none the less egoistic On p 49 I referred to a h rt dream in which Professor M sa s *My son the myopic* and I stated that this was only a preliminary dream, preceding another in which I play a part. Here is the main dream previ ously omitted, which challenges us to explain its absurd and unintelligib e w rd formation.

On account of something or other that is ha pening in Rom it is n es ary for the chil dren to fle en thus they do The scene is then laid before a g te a double g te in the ancient style (the Porta Romana in Siena as I real ize wh e I am dreaming) I am si ti g on the edge of a well and I am greatly depr ssed I am almost weeping A woman—a nurse a nun —brings out the two boys nd hands them over t their father who is ot myself The elder s distinctly my eldest son but I do not see the face f th other boy The woman asks the eld st boy for a parting kiss She is remarkab e for a ed ose The boy refuse her the kiss but say to her extending her his hand in part ing Auf Geseres and t both of us (or to one f us) Auf Ungeseres. I have the ide th t this ind cates a pr ference

This dream is built upon a tangle of thoughts ind ced by a play I saw t the theatre called *Das eue Ghetto (The New Ghet o)* Th Jew ish question, anxiety as to the future f my children, who cannot be given f therland anx ty as to ed cating them so that they may enjoy the privileges f citizens—all these fea tures may easily be recognized in the com panying dream thoughts.

By the wat rs of Babylon we sat down and

wept Siena like Rome is famous for its beautiful fountains In the dream I have to find some sort of substitute for Rome (cf p 217) from among localities which are known to me *Near the Porta Romana of Siena* we saw a large bri htly lit building which we learned was the *Manicomio* the insane asylum Shortly before the dream I had heard that a co religionist had been forced to resign a position which he had ecured with *great effort in a State* asylum

Our interest is aroused by the speech *Auf Geseres* where one might expect from the situation continued throughout the dream *Auf Wiedersehen (Au revoir)* and by its quite meaningless antithesis *Auf Ungeseres* (*Un* is a prefix meaning not)

According to information received from Hebrew scholars *Geseres* is a genuine Hebrew word derived from the verb *goiser* and may best be rendered by ordained sufferings fated disaster From its employment in the Jewish *jargon one would take it to mean* wailing and lamentation *Ungeseres* is a coinage of my own and is the first to attract my attention but for the present it baffles me The little ob ervation at the end of the dream—that *Ungeseres* indicates an advantage over *Geseres*—opens the way to the associations and therewith to understanding This relation holds good in the case of caviar the *unsalted kind* is more highly prized than the salted Caviar to the general — noble passions Herein lies concealed a jesting allusion to a member of my household of whom I hope—for she is younger *than I—that she will watch over the future of* my children this too agrees with the fact *that another member of my household our* worthy nurse is clearly indicated by the nurse (or nun) of the dream But a connecting link is wanting between the pair *salted—unsalted* and *Geseres—Ungeseres* This is to be found in *gesauert* and *ungesauert* (*leavened* and *unleavened) In their flight or exodus from Egypt* the children of Israel had not time to allow th ir dough to become leavened and in commemoration of this event they eat unleavened bread at Passover to this day Here too I can find room for the sudden association which occurred to me in this part of the analysis I remembered how we my friend from Berlin and myself had strolled about the streets of Breslau a city which was strange to us during the last days of Easter A little girl asked me the way to a certain street *I had to tell her* that I did not know it I then remarked to my friend I hope that later on in life the child will how more perspicacity in electin the persons whom she allows to direct her Shortly afterwards a sign caught my eye Dr *Herod* consulting hours I said to myself I hope this colleague does not happen to be a children s specialist Meanwhile my friend had been developing his views on the biological significance of *bilateral symmetry* and had begun a sentence with the words *If we had only one* eye in the middle of the forehead like Cyclops This leads us to the speech of the professor in the preliminary dream *My son the myopic* And now I have been led to the *chief source for Geseres* Many years ago when this son of Professor M s who is today an independent thinker was still sitting on his school bench he contracted an affection of the eye which according to the doctor gave some cause for anxiety He expressed the opinion that so long as it was confined *to one eye* it was of no great significance but that if it should extend to the other eye *it would be* serious The affection subsided in the one eye without leaving any ill effects shortly afterwards however the same symptoms did actually appear in the other eye The boy s *terrified mother immediately* summoned the physician to her distant home in the country But the doctor was now of a different opinion (took *the other side) What sort of Geseres is this you are making?* he asked the mother impatiently *If one side got well the other will too* And so it turned out

And now as to the connection between this *and myself and my family* The *school bench* upon which Professor M s son learned his first *lessons has become the property of* my eldest son it was given to him by the boy s mother and it is into his mouth that I put the words of farewell in the dream One of the wishes that may be connected with this tranference may now be readily guessed This school bench *is intended by its construction* to guard the child from becoming *shortsighted* and *one sided* Hence *myopia* (and behind it the Cyclops) and the discussion about *bilateralism* The fear of one sidedness has a twofold significance it might mean not only physical one sidedness but intellectual one sidedness also Does it not seem as though the scene in the dream with all its craziness were contradicting precisely this anxiety? When *on the one hand* the boy has spoken his words of farewell, *on the other hand he calls out the very* opposite as though to establish an equilibrium He is

acting as it were in obedience to bilateral symmetry

Thus a dream frequently has the profoundest meaning in the places where it seems most absurd. In all ages those who have had something to say and have been unable to say it without danger to themselves have gladly donned the cap and bells He for whom the forbidden saying was intended was more likely to tolerate it if he was able to laugh at it and to flatter himself with the comment that what he disliked was obviously absurd. Dreams behave in real life as does the prince in the play who is obliged to pretend to be a madman, and hence we may say of dreams what Hamlet said of himself, substituting an unintelligible jest for the actual truth "I am but mad north-north-west when the wind is southerly I know a hawk from a handsaw" (Act II, sc. ii)

Thus, my solution of the problem of absurdity in dreams is that the dream thoughts are never absurd—at least, not those of the dreams of sane persons—and that the dream work produces absurd dreams, and dreams with individually absurd elements when the dream-thoughts contain criticism, ridicule and derision, which have to be given expression My next concern is to show that the dream work is exhausted by the co-operation of the three factors enumerated—and of a fourth which has still to be mentioned—that it does no more than translate the dream-thoughts observing the four conditions prescribed and that the question whether the mind goes to work in dreams with all its intellectual faculties, or with only part of them is wrongly stated, and does not meet the actual state of affairs. But since there are plenty of dreams in which judgments are passed, criticisms made, and facts recognized in which astonishment at some individual element of the dream appears, and explanations are attempted and arguments adduced, I must meet the objections deriving from these occurrences by the citation of selected examples.

My answer is as follows *Everything in dreams which occurs as the apparent functioning of the critical faculty is to be regarded not as the intellectual performance of the dream-* — *the substance of the* ... *form* ... *than* ... *which* are passed upon the dream as ... is ... bered *after waking* and the feelings which are aroused by the reproduction of the dream belong largely to the latent dream-content, and must be fitted into place in the interpretation of the dream.

1 One striking example of this has already been given. A female patient does not wish to relate her dream *because it was too vague* She saw a person in the dream, and does not know *whether it was her husband or her father* Then follows a second dream fragment, in which there occurs a *manure pail* with which the following reminiscence is associated. As a young housewife she once declared jestingly in the presence of a young male relative who frequented the house that her next business would be to procure a new manure-pail Next morning one was sent to her but it was filled with lilies ... served to ... own ... e find ... of a story heard in youth namely that a girl had given birth to a child and that *it was not clear who was the father* The dream representation here overlaps into the waking thought, and allows one of the elements of the dream thoughts to be represented by a judgment formed in the waking state, of the whole dream.

2 A similar case One of my patients has a dream which strikes him as being an interesting one for he says to himself immediately after waking "*I must tell that to the doctor*" The dream is analysed and shows the most distinct allusion to an affair in which he had become involved during the treatment and of which he had decided to *tell me nothing*

3 Here is a third example from my own experience

I go to the hospital with P through a neighbourhood in which there are houses and gardens Thereupon I have an idea that I have

This dream furnishes a good example in support of the universally valid doctrine that dreams of the same night even though they are separated in the ...

The German expression is equivalent to our saying "I am not responsible for that," "That is not my funeral" "That" not due to my own efforts.—TR.
The injunction ... resolve already contained in the dream "*I must tell that to the doctor*" when it occurs in dreams during psycho-analytic treatment, is constantly accompanied by a great resistance to confessing the dream and is not infrequently followed by the forgetting of the dream.

already seen this locality several times in my dreams I do not know my way very well P shows me a way which leads round a corner to a restaurant (indoor) here I ask for Frau Doni and I hear that she is living at the back of the house in a small room with three children I go there and on the way I meet an undefined person with my two little girls After I have been with them for a while I take them with me A sort of reproach against my wife for having left them there

On waking I am conscious of a great *satisfaction* whose motive seems to be the fact that I shall now learn from the analysis what is meant by *I have already dreamed of this* But the analysis of the dream tells me nothing about this it shows me only that the satisfaction belongs to the latent dream content and not to a judgment of the dream It is *satisfaction concerning the fact that I have had children by my marriage* P s path through life and my own ran parallel for a time now he has outstripped me both socially and financially but his marriage has remained childless Of this the two occasions of the dream give proof on complete analysis On the previous day I had read in the newspaper the obituary notice of a certain Frau *Dona A—y* (which I turn into Doni) who had died in childbirth I was told by my wife that the dead woman had been nursed by the same midwife whom she herself had employed at the birth of our two youngest boys The name *Dona* had caught my attention for I had recently met with it for the first time in an English novel The other occasion for the dream may be found in the date on which it was dreamed this was the night before the birthday of my eldest boy who it seems is poetically gifted

4 The same satisfaction remained with me after waking from the absurd dream that my father after his death had played a political role among the Magyars It is motivated by the persistence of the feeling which accompanied the last sentence of the dream *I remember that on his deathbed he looked so like Garibaldi and* I am glad *that it has really come true (Followed by a forgotten continuation)* I can now supply from the analysis what should fill this gap It is the mention of my second boy to whom I have given the baptismal name of an eminent historical personage who attracted me greatly during my boyhood especially during my stay in England I had to wait for a year before I could fulfil my intention of using this name if the next child should be a son and with great *satisfaction* I greeted him by this name as soon as he was born It is easy to see how the fathers suppressed desire for greatness is in his thoughts, transferred to his children one is inclined to believe that this is one of the ways by which the suppression of this desire (which becomes necessary in the course of life) is effected The little fellow won his right to inclusion in the text of this dream by virtue of the fact that the same accident—that of soiling his clothes (quite pardonable in either a child or in a dying person)—had occurred to him Compare with this the allusion *Stuhlrichter* (presiding judge) and the wish of the dream to stand before one s children *great* and *undefiled*

5 If I should now have to look for examples of judgments or expressions of opinion which remain in the dream itself and are not continued in or transferred to our waking thoughts my task would be greatly facilitated were I to take my examples from dreams which have already been cited for other purposes. The dream of Goethe s attack on Herr M appears to contain quite a number of acts of judgment *I try to elucidate the temporal relations a little as they seem improbable to me* Does not this look like a critical impulse directed against the nonsensical idea that Goethe should have made a literary attack upon a young man of my acquaintance? *It seems plausible to me that he was 18 years old* That sounds quite like the result of a calculation, though a silly one and the *I do not know exactly what is the date of the present year* would be an example of uncertainty or doubt in dreams

But I know from analysis that these acts of judgment which seem to have been performed in the dream for the first time admit of a different construction in the light of which they become indispensable for interpreting the dream while at the same time all absurdity is avoided With the sentence *I try to elucidate the temporal relations a little* I put myself in the place of my friend who is actually trying to elucidate the temporal relations of life The sentence then loses its significance as a judgment which objects to the nonsense of the previous sentences The interposition *Which seems improbable to me* belongs to the following *It seems plausible to me* With almost these identical words I replied to the lady who

A s bject wh ch has bee t ly discus ed i rece t vol mes f th *Rev Phil ph q* (p m ne a in d eams)

tion of her brother's illness. It seems improbable to me that the cry of "Nature, Nature," was in any way connected with Goethe; it seems much more plausible to me that it has the sexual significance which is known to you. In this case it is true the judgment was expressed, but in reality, not in a dream, and on an occasion which is remembered and utilized by the dream-thoughts. The dream-content appropriates this judgment like any other fragment of the dream-thoughts.

The number 18 with which the judgment in the dream is meaninglessly connected still retains a trace of the context from which the real judgment was taken. Lastly, the *I do not know exactly when is the date of the present year* is intended for no other purpose than that of my identification with the paralytic, in examining whom this particular fact was established.

In the solution of these apparent acts of judgment in dreams, it will be well to keep in mind the above-mentioned rule of interpretation, which tells us that we must disregard the coherence which is established in the dream between its constituent parts as an unessential phenomenon, and that every dream-element must be taken separately and traced back to its source. The dream is a compound, which for the purposes of investigation must be broken up into its elements. On the other hand, we become alive to the fact that there is a psychic force which expresses itself in our dreams and establishes this apparent coherence; that is, the material obtained by the dream-work undergoes a secondary elaboration. Here we have the manifestations of that psychic force which we shall presently take into consideration as the fourth of the factors which co-operate in dream formation.

6. Let us now look for other examples of acts of judgment in the dreams which have already been cited. In the absurd dream about the communication from the town council, I ask the question, *You married soon after?* *I reckon that I was born in 1856, which seems to me to be directly afterwards.* This certainly takes the form of an inference. My father married shortly after his attack, in the year 1855; I am the eldest son, born in 1856; so this is correct. But we know that this inference has in fact been falsified by the wish-fulfilment, and that the sentence which dominates the dream-thoughts is as follows: *Four or five years—that is no time at all—that need not be counted.* But every part of this chain of reasoning may be seen to be otherwise determined from the dream-thoughts as regards both its content and its form. It is the patient of whose patience my colleague complains who intends to marry immediately the treatment is ended. The manner in which I converse with my father in this dream reminds me of an *examination* or *cross-examination*, and thus of a university professor who was in the habit of compiling a complete docket of personal data when entering his pupils' names: *You were born when?—1856.—Patre?*—Then the applicant gave the Latin form of the baptismal name of the father and we students assumed that the Hofrat drew inferences from the father's name which the baptismal name of the candidate would not always have justified. Hence the *drawing of inferences* in the dream would be merely the repetition of the *drawing of inferences* which appears as a scrap of material in the dream-thoughts. From this we learn something new. If an inference occurs in the dream-content, it assuredly comes from the dream-thoughts; but it may be contained in these as a fragment of remembered material, or it may serve as the logical connective of a series of dream-thoughts. In any case, an inference in the dream represents an inference taken from the dream-thoughts.[1]

It will be well to continue the analysis of this dream at this point. With the inquisition of the professor is associated the recollection of an index (in my time published in Latin) of the university students; and further, the recollection of *my own course of study*. The *five years* allowed for the study of medicine were, as usual, too little for me. I worked unconcernedly for some years longer; my acquaintances regarded me as a loafer, and doubted whether I should get through. Then, suddenly, I decided to take my examinations, and I got through *in spite of the postponement*. A fresh confirmation of the dream-thoughts with which I defiantly meet my critics: "Even though you won't believe it, because I am taking my time, I shall reach the *conclusion* (German, *Schluss* = end, conclusion, *inference*). It has often happened like that."

In its introductory portion, this dream contains several sentences which, we can hardly deny, are of the nature of an argument. And this argument is not at all absurd; it might

[1] These results correct, in several points, my earlier statements concerning the representation of logical relations (p. 55). These described the general procedure of the dream-work, but overlooked its most delicate and most careful operations.

just as well occur in my waking thoughts *In my dream I make fun of the communication from the town council for in the first place I was not yet born in 1851 and in the second place my father to whom it might refer is already dead* Not only is each of these statements perfectly correct in itself but they are the very arguments that I should employ if I received such a communication We know from the foregoing analysis (p 309) that this dream has sprung from the soil of deeply embittered and scornful dream thoughts and if we may also assume that the motive of the censorship is a very powerful one we shall understand that the dream thought has every occasion to create *a flawless refutation of an unreasonable demand* in accordance with the pattern contained in the dream thoughts But the analysis shows that in this case the dream work has not been required to make a free imitation but that material taken from the dream thoughts had to be employed for the purpose It is as though in an algebraic equation there should occur besides the figures plus and minus signs and symbols of powers and of roots and as though someone in copying this equation without understanding it should copy both the symbols and the figures and mix them all up together The two arguments may be traced to the following material It is painful to me to think that many of the hypotheses upon which I base my psychological solution of the psychoneuroses will arouse scepticism and ridicule when they first become known For instance I shall have to assert that impressions of the second year of life and even the first leave an enduring trace upon the emotional life of subsequent neuropaths and that these impressions —although greatly distorted and exaggerated by the memory—may furnish the earliest and profoundest basis of a hysterical symptom Patients to whom I explain this at a suitable moment are wont to parody my explanation by offering to search for reminiscences of the period *when they were not yet born* My disclosure of the unsuspected part played by the father in the earliest sexual impulses of female patients may well have a similar reception (Cf the discussion on p 244) Nevertheless it is my well founded conviction that both doctrines are true In confirmation of this I recall certain examples in which the death of the father occurred when the child was very young and subsequent incidents otherwise inexplicable proved that the child had unconsciously preserved recollections of the person who had so early gone out of its life I know that both my assertions are based upon *inferences* whose validity will be attacked It is the doing of the wish fulfilment that precisely the material of those inferences which I fear will be contested, should be utilized by the dream work for establishing *incontestable conclusions*

7 In one dream which I have hitherto only touched upon astonishment at the subject emerging is distinctly expressed at the outset.

The elder Brucke must have set me some task or other strangely enough it relates to the preparation of the lower part of my own body the pelvis and legs which I see before me as though in the dissecting room but without feeling the absence of part of my body and without a trace of horror Louise N is standing beside me and helps me in the work The pelvis is eviscerated now the upper now the lower aspect is visible and the two aspects are commingled Large fleshy red tubercles are visible (which even in the dream make me think of haemorrhoids) Also something lying over them had to be carefully picked off it looked like crumpled tinfoil Then I was once more in possession of my legs and I made a journey through the city but I took a cab (as I was tired) To my astonishment the cab drove into the front door of a house which opened and allowed it to pass into a corridor which was broken off at the end and eventually led on into the open Finally I wandered through changing landscapes with an Alpine guide who carried my things He carried me for some distance out of consideration for my tired legs The ground was swampy we went along the edge people were sitting on the ground like Red Indians or gypsies among them a girl Until then I had made my way along on the slippery ground in constant astonishment that I was so well able to do so after making the preparation At last we came to a small wooden house with an open window at one end Here the guide set me down and laid two planks which stood in readiness on the window sill so as to bridge the chasm which had to be crossed from the window Now I grew really alarmed about my legs Instead of the expected crossing I saw two grown up men lying upon wooden benches which were fixed on the walls of the hut and something like two

has achieved its masterp ece I was once in a gra e but it was an empty Etruscan grave near Orvieto—a narrow chamber with two stone benches on the walls upon which were lying the skeletons of two adults The interi r of the wooden house n the dream looks exactly like this gra e except that stone has been re placed by wood The dream seems to ..ay If *you must already sojourn in your grave* let it be this Etruscan gra e and by means of this interpolation it transforms the most mournful expectation nto one that is really to be de-sired Unf rtun tely as we shall learn, the dream is able t cha ge to its opposite only th idea compa ying an affect but not al ways th affect itself Hence I awake with *thoughts of terror* even fter the idea that perhap my children will achieve what has been denied to their father has fo ced its way to *represe tatio a fresh allus on to the strange* romance in which the identity of a charact r is preserved through a series of ge erations cover in two thousand years

8 In the context of an ther dream there is a imilar express on of asto ishme t at what is experienced in the dream This however is nn cted with u h a striking f r fetched a d almo t intellectual attempt at explanation that f only o thi ccount I h uld ha e to subject th whol dream to analysis even if it did not possess two othe interesting fea tures On the ni ht of the eighteenth of July I wa tra elli g o the South rn Railway and in my sleep I heard someo e c ll out *H llth rn 10 m t s" I mmed tely th nk f Holo thuria—of natural hist ry museum—th t h e is place where valiant men h e r nly sist d the d m nat on f thei overlo d— Y s th cou er-r format n n Austria!—A th gh t were pl ce Styria or th Tyr l*

Now I see indistinctly a small museum in which the relics or the acquisitions of these men are preserved I should like to leave the train but I hesitate to do so There are women with fruit on the platform they squat on the ground and in that position invitingly hold up their baskets—I hesitated in doubt as to whether we have time but here we are still stationary—I am suddenly in another compartment in which the leather and the seats are so narrow that one s spine directly touches the back I am surprised at this but I may have changed carriages while asleep Several people among them an English brother and sister a row of books plainly on a shelf on the wall—I see The Wealth of Nations *and* Matter and Motion *(by Maxwell) thick books bound in brown linen The man asks his sister about a book of Schiller s whether she has forgotten it These books seem to belong now to me now to them At this point I wish to join in the conversation in order to confirm or support what is being said* I wake sweating all over because all the windows are shut The train stops at *Marburg*

While writing down the dream a part of it occurs to me which my memory wished to pass over *I tell the brother and sister (in English) referring to a certain book It is from but I correct myself It is by The man remarks to his sister He said it correctly*

The dream begins with the name of a station which seems to have almost waked me For this name which was *Marburg* I substitute *Hollthurn* The fact that I heard Marburg the first or perhaps the second time it was called out is proved by the mention of Schiller in the dream he was born in Marburg though not the Styrian Marburg Now on this occasion although I was travelling first class I was doing so under very disagreeable circumstances The train was overcrowded in my compartment I had come upon a lady and gentleman who seemed very fine people and had not the good breeding or did not think it worth while to conceal their displeasure at my intrusion My polite greeting was not returned and although they were sitting side by side (with their backs to the en ine) the woman before my eyes hastened to pre-empt the eat opposite her and next to the window with her umbrella the door was immediately closed, and pointed remarks about the opening of windows were exchanged Probably I was quickly recognized as a person hungry for fresh air It was a hot ni ht and the atmo phere of the compartment closed on both sides, was almost suffocating My experience as a traveller leads me to believe that such inconsiderate and overbearing conduct marks people who have paid for their tickets only partly or not at all When the conductor came round and I presented my dearly bought ticket the lady exclaimed haughtily and almost threateningly

My husband has a pass She was an imposing looking person with a discontented expression in age not far removed from the autumn of feminine beauty the man had no chance to say anything he sat there motionless I tried to sleep In my dream I take a terrible revenge on my disagreeable travelling companions no one would suspect what insults and humiliations are concealed behind the disjointed fragments of the first half of the dream After this need has been satisfied the second wi h to exchange my compartment for another makes itself felt The dream changes its scene so often, and without making the slightest objection to such changes that it would not have seemed at all remarkable had I at once from my memories replaced my travelling companions by more agreeable persons But here was a case where something or other opposes the change of scene and finds it necessary to explain it. How did I suddenly get into another compartment? I could not positively remember having chan ed carriages So there was only one explanation *I must have left the carriage while asleep*—an unusual occurrence examples of which however are known to neuropathologists We know of persons who undertake railway journeys in a crepuscular state without betraying their abnormal condition by any sign whatever until at some stage of their journey they come to themselves and are surprised by the gap in their memory Thus while I am still dreaming I declare my own case to be such a case of *automatisme ambulatoire*

Analysis permits of another solution The attempt at explanation which so surprises me if I am to attribute it to the dream work is not original but is copied from the neurosis of one of my patients I have already spoken

Th descr pt s t i t ll g bl t mys lf b t I f ll w th p pl f p d g th d m thos wo d wh ch oc t m wh le I m w u g t d wn Th word g ts lf s pa t f th dre m r p tatio

in another chapter of a highl cultured and kindly man who began hortly after the death of his pare ts t accuse himself of murderous tendencies, and wh was distressed by the pretendencies, and which he had to take to customary mea res which he had to take to secure himself against these tendencies His was a case f severe obsess onal ideas with full insight. To begin with it was painful to him to walk through the street s he was obsessed by the necessity of ccounting for all the per sons he met he had to know whither they had disappeared if one of them suddenly luded his pursuing glance h was left with a feeling f distress and the dea that he might possibly have made away with the man. Behind this bsessive idea was co cealed, amon other things, a Cain-phantasy for all men are brothers. Owing to the impos bility of accomplishing this task, he ga e up going for walks, and spent his life mprisoned within his four walls. But reports f murders which had been c mmitted in the world out de were constantly reaching hi room by way of the news papers and his conscienc tormented him with the doubt that he might be the murdere f r whom the police were looking The certainty that he had n t left the house f r weeks protected him fo tim gainst these a cusations until on day there dawned upon him the possibility that *he m ght ha left his h us while in an unconscious st e* and might thus ha e committed murder with t knowing anything bout it. From that time wards he locked his front door and ga e the key to his old housekeeper trictly f b dding her to give t int hi hands even if he demanded t.

This then, is the origin of th ttempted explanation that I may have changed carriages whil in an un nscious ta e it has been taken into th dr am ready mad from the material f the dream thou hts and is evidently int ded t dentify me with th person of my patient My m mory of this patient was awake ed by natural a ociation. My last night journey had been mad few weeks ea lier in his mpany H was cured, and w wer g ing int the country togethe to his relatives who had sent f m as we had a ompartment to ourselve we left all the window open thr ugh out the night, and f as l as I remained wak we had most resting onversation.

dream really resolves itself into a wanton phantasy to the effect that my two elderly tra elling compa ons had acted o unci lly towards me because my arrival on the scene had prevented them from exchangin ki es and embraces d ring the n ght as they had intended. This phantasy however goes back to an early incident of my childhood when probably mpelled by sexual curios ty I had intruded into my parents bedroom and was driven thence by my father s emphatic command.

I think it would be superfluous to mul iply such examples. They would all confirm what we have learned from those already cited namely that an act of judgment in a dream is m rely the repetition of n original act of judgment in the dream thoughts In most cases t is an unsu tabl repetition fitted into an inappropriate con ext occas onally however as in our last example it is so artfully applied that it may alm t give one the impres on of h dream

tio of dreams yet endeavours to fuse th dream-elements f different origin into a flawless and significa t whole. We consider it necessary h wever first of ll to consider the expressions of ffect which appear in dreams and to c mpare these with the affects which analysis disco ers in the dream thoughts

H. *The Affects in Dreams*

A shrewd remark of Strick r s called our attention to th fact that the expres o s of affects in dreams cannot be d posed of in the contemptuous fashion in which we are wo t to shake off the dream-content after we ha e waked. 'If I am afraid of robbers in my dreams the robbers to be sure re imaginary but th fear of them s real and the s me thin is true if I rej e n my dream. A c rd ing to the testim ny of r feelings, an affect experi ced in a dream is in no way inferior to o e f lik intens ty experienced in waki g life and the dream presses ts claim to be accepted part of our real psychic experi nces by virtu of ts aff ct e rather than ts deat onal co tent In th wakin tate we do not put the bef re the th r s nce w d n t kn w h w to evaluate an affect psychically except in conn ction with an deational co tent. If an ff ct and an dea re ill matched as regards th r nature o the inten ty ou w kn

himself the sec d scene f the

judgment becomes confused

The fact that in dreams the ideational content does not always produce the affective result which in our waking thoughts we should expect as its necessary consequence has always been a cause of astonishment Strumpell declared that ideas in dreams are stripped of their psychic values But there is no lack of instances in which the reverse is true when an intensive manifestation of affect appears in a content which seems to offer no occasion for it In my dream I may be in a horrible dangerous or disgusting situation and yet I may feel no fear or aversion on the other hand I am sometimes terrified by harmless things and sometimes delighted by childish things

This enigma disappeared more suddenly and more completely than perhaps any other dream problem if we pass from the manifest to the latent content We shall then no longer have to explain it for it will no longer exist Analysis tells us that *the ideational contents have undergone displacements and substitutions while the affects have remained unchanged* No wonder then that the ideational content which has been altered by dream distortion no longer fits the affect which has remained intact and no cause for wonder when analysis has put the correct content into its original place

In a psychic complex which has been subjected to the influence of the resisting censorship the affects are the unyielding constituent which alone can guide us to the correct completion This state of affairs is revealed in the psychoneuroses even more distinctly than in dreams Here the affect is always in the right at least as regards its quality its intensity may of course be increased by displacement of the neurotic attention When the hysterical patient wonders that he should be so afraid of a trifle or when the sufferer from obsessions is astonished that he should reproach himself so bitterly for a mere nothing they are both in error inasmuch as they regard the conceptual content—the trifle the mere nothing—as the essential thing and they defend themselves in vain because they make this conceptual content the starting point of their thought work Psycho analysis however puts them on the right path inasmuch as it recognizes that, on the contrary it is the affect that is justified, and looks for the concept which pertains to it, and which has been repressed by a substitution All that we need assume is that the liberation of affect and the conceptual content do not constitute the indissoluble organic unity as which we are wont to regard them but that the two parts may be welded together so that analysis will separate them Dream interpretation shows that this is actually the case

I will first of all give an example in which analysis explains the apparent absence of affect in a conceptual content which ought to compel a liberation of affect

I

The dreamer sees three lions in a desert one of which is laughing but she is not afraid of them Then however she must have fled from them for she is trying to climb a tree But she finds that her cousin the French teacher is already up in the tree etc

The analysis yields the following material The indifferent occasion of the dream was a sentence in the dreamer's English exercise The *lion's* greatest adornment is his mane Her father used to wear a beard which encircled his face like a *mane* The name of her English teacher is Miss *Lyons* An acquaintance of hers sent her the ballads of *Loewe* (*Loewe*= lion) These then are the three lions why should she be afraid of them? She has read a story in which a negro who has incited his fellows to revolt is hunted with bloodhounds and climbs a tree to save himself Then follow fragmentary recollections in the merriest mood such as the following directions for catching lions (from *Die Fliegende Blatter*) Take a desert and put it through a sieve the lions will be left behind Also a very amusing but not very proper anecdote about an official who is asked why he does not take greater pains to win the favour of his chief and who replies that he has been trying to creep into favour but that his immediate superior was *already up there* The whole matter becomes intelligible as soon as one learns that on the dream-day the lady had received a visit from her husband's superior He was very polite to her and

If I m ot g e tly m st ke the fi t d e m wh ch I was abl t l t f m my g d (ged m th) p ts to the f t th t th d m w k h d s eded t sf m g t m te l t wish f lfilm t wh l the ffect wh ch b l g d to it e- m d chang d th l p tat The ght bef e ts f th wa t r t t the f t the ch ld ed t bb g l tly P p P p— B by Th t m y m L t P p d B by t ll be togethe wh l the w ep g t k cog za f the mm t depa t e Th ch ld wa t th t m ry w ll bl t exp ess the co ept of sep t n. *F t* (= *u y* repl c d by a pec l a ly c t d } g d awn-o t *h*) h d bee h first w d d f many m th bef re this first d eam h h d pl yed at *w y* w th ll his toys wh ch w t back to his ea ly self-co quest) all w g h m th to go aw y

kissed her hand, and *she was not at all afraid of him* although he is a *big bug (Grosses Tier* =big animal) and plays the part of a social lion in the capital of her country This lion is therefore, like the lion in *A Midsummer Night's Dream* who is unmasked as Snug the joiner and of such stuff are all the dream lions of which one is not afraid.

II

As my second example I will cite the dream of the girl who saw her sister's little son lying as a corpse in his coffin, but who it may be added was conscious of no pain or sorrow Why she was unmoved we know from the analysis. The dream only disguised her wish to see once more the man she loved the affect had to be attuned to the wish, and not to its disguisement. There was thus no occasion for sorrow

In a number of dreams the affect does at least remain connected with the conceptual content which has replaced the content really belonging to it. In others the dissolution of the complex is carried farther The affect is entirely separated from the idea belonging to it, and finds itself accommodated elsewhere in the dream, where it fits into the new arrangement of the dream-elements We have seen that the same thing happens to acts of judgment in dreams. If an important inference occurs in the dream-thoughts there is one in the dream also but the inference in the dream may be displaced to entirely different material. Not infrequently this displacement is effected in accordance with the principle of antithesis

I will illustrate the latter possibility by the following dream, which I have subjected to the most exhaustive analysis

III

A castle by the sea afterward it lies no directly on the coast but on a narrow canal leading to the sea A ert is Herr P is the governor of the castle I stand with him in a large salon with three windows in front of which rise the projections of a wall like battlements of a fortress I belong to the garrison perhaps as a volunteer naval officer We fear the arrival of enemy warships for we are in a state of war Herr P intends to leave the castle he gives me instructions as to what must be done if what we fear should come to pass His sick wife and his child are in the threatened castle As soon as the bombardment begins the large hall is to be cleared He breathes heavily and tries to get away I detain him and ask him how I am to send him news in case of need He says something further and immediately afterwards he sinks to the floor dead. I have probably taxed him unnecessarily with my questions After his death which makes no further impression upon me I consider whether the widow is to remain in the castle whether I should give notice of the death to the higher command whether I should take over the control of the castle as the next in command. I now stand at the window and scrutinize the ships as they pass by they are cargo steamers and they rush by over the dark water several with more than one funnel others with bulging decks (these are very like the railway stations in the preliminary dream which has not been related) Then my brother is standing beside me and we both look out of the window on to the canal At the sight of one ship we are alarmed and call out Here comes the warship! It turns out however that they are only the ships which I have already seen returning Now comes a small ship comically truncated so that it ends amidships on the deck one sees curious things like cups or little boxes We call out as with one voice That is the breakfast ship

The rapid motion of the ships, the deep blue of the water the brown smoke of the funnels —all these together produce an intense and gloomy impression.

The localities in this dream are compiled from several journeys to the Adriatic (Miramare Duino Venice Aquileia) A short but enjoyable Easter trip to Aquileia with my brother a few weeks before the dream, was still fresh in my memory also the *naval war* between America and Spain, and, associated with this my anxiety as to the fate of my relatives in America play a part in the dream. Manifestations of affect appear at two places in this dream. In one place an affect that would be expected is lacking it expressly emphasized that the death of the governor makes no impression upon me at another point, when I see the warships I am *frightened* and experience all the sensations of fright in my sleep The distribution of affects in this well-constructed dream has been effected in such a way that any obvious contradiction is avoided. For there is no reason why I should be frightened at the governor's death, and it is fitting that, as the commander of the castle I should be alarmed by the sight of the warship Now analysis shows that Herr P is nothing but a substitute for my own ego (in the dream I am his substitute)

I am the governor who suddenly dies The dream thoughts deal with the future of my family after my premature death No other disagreeable thought is to be found among the dream thoughts The alarm which goes with the sight of the warship must be transferred from it to this disagreeable thought Inversely the analysis shows that the region of the dream thoughts from which the warship comes is laden with most cheerful reminiscences In Venice a year before the dream one magically beautiful day we stood at the windows of our room on the Riva Schiavoni and looked out over the blue lagoon on which there was more traffic to be seen than usual Some English ships were expected they were to be given a festive reception and suddenly my wife cried happy as a child *Here comes the English warship!* In the dream I am frightened by the very same words once more we see that speeches in dreams have their origin in speeches in real life I shall presently show that even the element *English* in this speech has not been lost for the dream work Here then between the dream thoughts and the dream content I turn joy into fright and I need only point to the fact that by means of this transformation I give expression to part of the latent dream content The example shows however that the dream work is at liberty to detach the occasion of an affect from its connections in the dream thoughts and to insert it at any other place it chooses in the dream content

I will take the opportunity which is here incidentally offered of subjecting to a closer analysis the *breakfast ship* whose appearance in the dream so absurdly concludes a situation that has been rationally adhered to If I look more closely at this dream object I am impressed after the event by the fact that it was black and that by reason of its truncation at its widest beam it achieved at the truncated end a considerable resemblance to an object which had aroused our interest in the museums of the Etruscan cities This object was a rectangular cup of black clay with two handles upon which stood things like coffee cups or tea cups very similar to our modern service for the *breakfast table* Upon inquiry we learned that this was the toilet set of an Etruscan lady with little boxes for rouge and powder and we told one another jestingly that it would not be a bad idea to take a thing like that home to the lady of the house The dream object therefore signifies a *black toilet* (*toilette* = dress) or mourning and refers directly to a death The other end of the dream object reminds us of the *boat* (German *Nachen* from the Greek root νεχυ as a philological friend informs me) upon which corpses were laid in prehistoric times and were left to be buried by the sea This is associated with the return of the ships in the dream

Silently on his rescued boat the old man drifts into harbour

It is the return voyage after the *shipwreck* (German *Schiff bruch* = ship *breaking*) the breakfast ship looks as though it were *broken* off amidships But whence comes the name *breakfast ship?* This is where *English* comes in which we have left over from the warships. *Breakfast* a *breaking of the fast Breaking* again belongs to shipwreck *(Schiff bruch)* and *fasting* is associated with the black (mourning)

But the only thing about this breakfast ship which has been newly created by the dream is its name The thing existed in reality and recalls to me one of the merriest moments of my last journey As we distrusted the fare in Aquileia we took some food with us from Goerz, and bought a bottle of the excellent Istrian wine in Aquileia and while the little mail steamer slowly travelled through the *canale delle Mee* and into the lonely expanse of lagoon in the direction of Grado we had breakfast on deck in the highest spirits—we were the only passengers—and it tasted to us as few breakfasts have ever tasted This then was the *breakfast ship* and it is behind this very recollection of the gayest *joie de vivre* that the dream hides the saddest thoughts of an unknown and mysterious future

The detachment of affects from the groups of ideas which have occasioned their liberation is the most striking thing that happens to them in dream formation but it is neither the only nor even the most essential change which they undergo on the way from the dream thoughts to the manifest dream If the affects in the dream thoughts are compared with those in the dream one thing at once becomes clear Wherever there is an affect in the dream it is to be found also in the dream thoughts the converse however is not true. In general a dream is less rich in affects than the psychic material from which it is elaborated When I have reconstructed the dream thoughts I see that the most intense psychic impulses are constantly striving in them for self assertion usually in conflict with others

which are harply opposed to them. Now if I ! ır

te dream wo k to the level ot tn uue I mt say that a *supp ession of the afects* has been accompl hed by the dream w rk Take for example the dream of the botanical monograph. It correspo ds t a pas onate plea for my freedom to act as I am acting to ar range my life as seems right to me and to me alone The dream which results from this sounds indiff rent I ha e written a monograph it is lying before me it is provided with coloured plates and dri d plants are to be found in each copy It is like th peace of a deserted battlefi ld no trace is l ft of the tumult of battle.

But things ma turn out quite d fferently vn d expres ons of affect may ent r into the dream itself but we will first f all co d the unquestioned fact that so many dreams appea indiaerent, wh rea it s neve poss ble to go deeply int the dream tho ghts without deep em tion.

The complet theoret cal explanati n of this suppression f aff cts durin the dre m work cann t be gi en here t would require most careful inves igati of the theory of the f fects and f the mechanism f repres on. Here I can put f rward only two suggestions I am for ed—f the re so s—to c ei e the liberation f affects as a centrifugal process di rect d toward the interior of the body analogous to the processes of m tor and secretory innervat on Just as in the sleeping tate the emi on f m to impulses towards the out r world seems t be suspended so the centrif gal wakening f affects by un on ci us think ing durin sleep may be rend red more difficult The ffective impulses whi h occur d ring the urse of the dream thought may thus in themselves be feebl so that thos that find thei way into the dream ar n stronge According to this line of thought the *supr sso of th f t* w uld t be a consequence of th dream w k t all but a consequen e of the tat f leep This may be so but t can t possibly be all the truth. We must remem be that all the m re mpl dreams ha e revealed themsel es s th result f compro m e between confli t g psy hic fo es. On the on hand, the wish formi g th ughts ha e to oppose the co tradictio f censorship on the oth hand we ha ften seen, even in unconscious thinking every train of thought is harnessed to its contradictory counterpart Since all these trains of thought are capable of arous ng affects we shall broadly speakin hardly go astray if we conceive the impression of affects as the result of the inhib tion which the co trasts impose upon one another and the cen orship upon the urges wh ch it has uppressed. *The inhibition of affects would ac cord ngly be the second consequence of the d e m-censorsh p just as d eam-distort on was the fir t consequence*

I will here insert an example of a dream in wh ch the ind fiere t emotional tone of the dream-content may be explained by th antag onism of the dream-thou hts I must relate the following short dream, which every reader will read with d gust

IV

Risi g ground and on it something l ke an open-air latri e a very long bench at the end of which is a wide aperture The whole of th back edge s th ckly covered with little heaps of excrement of all si es and degrees of f esh ess A thicket behind the bench I urinate upon the berch a long s' eam of urine rinses everyth g clea the patches of xcrement come off easily and fall in.o the openi g Never theless t s ems as though something remained at the end

Why did I xperience no disgust in this d eam?

Because as the analys s sh ws the most pleasant and gratifying thoughts ha e cooperated in the formation of this dream Upon analysin it I immediately think of the *A g an st bles* which were cleansed by Hercules I am thi Hercules The ris g ground and the thick t belon to Aussee where my children are w staying I have discovered the infantile etiology of the uroses and have thus guarded my own children from falli g ill. The bench (omitting the aperture of course) is the faith f l opy of p ece f f rn ture of which an ffect nat female patient has mad m a pres t Thi reminds me how my patients honour m E e the museum f human excrement s usc ptib e of gratifying interpret tion. How ever m ch it di gusts me t s a souvenir of the be ut ful land of Italy where in the small cities as ev ryo e knows the pri ies re n t equipped in any ther way The tream of uri e that washes ev rything lean is an un mistakabl allu on t greatness It s in this manne that *Gull ver* extinguishes th great fire

in Lilliput to be sure he thereby incurs the displeasure of the tiniest of queens In this way too Gargantua the superman of Master Rabelais takes ven eance upon the Pari ians straddling Notre Dame and training his tream of urine upon the city Only yesterday I was turning over the leaves of Garnier s illustra tions to Rabelais before I went to bed And strangely enough here is another proof that I am the superman! The platform of Notre Dame was my favourite nook in Paris every free afternoon I used to go up into the towers of the cathedral and there clamber about be tween the monsters and gargoyles The circum stance that all the excrement vanishes so rapidly before the stream of urine corresponds to the motto *Afflavit et dissipati sunt* which I shall some day make the title of a chapter on the therapeutics of hysteria

And now as to the affective occasion of the dream It had been a hot summer afternoon in the evening I had given my lecture on the connection between hysteria and the perver sions and everything which I had to say dis pleased me thoroughly and seemed utterly val ueless I was tired I took not the least pleasure in my difficult work and longed to get away from this rummaging in human filth first to see my children and then to revisit the beau ties of Italy In this mood I went from the lecture hall to a cafe to get some little refresh ment in the open air for my appetite had forsaken me But a member of my audience went with me he begged for permission to sit with me while I drank my coffee and gulped down my roll and began to say flattering things to me He told me how much he had learned *from me that he now saw everything through* different eyes that I had cleansed the *Augean stables* of error and prejudice which encum bered the theory of the neuroses—in short that I was a very great man My mood was ill suited to his hymn of praise I struggled with my disgust and went home earlier in or der to get rid of him and before I went to sleep I turned over the leaves of *Rabelais* and read a short story by C F Meyer entitled *Die Leiden eines Knaben* (The Sorrows of a Boy)

The dream had originated from this mate rial and Meyer s novel had supplied the recol lections of scenes of childhood The day s mood of annoyance and disgust is continued in the dream inasmuch as it is permitted to fur nish nearly all the material for the dream con tent But during the night the opposite mood of vigorous even immoderate self assertion awakened and dissipated the earlier mood The dream had to assume such a form as would accommodate both the expressions of elf-de preciation and exaggerated self glorification in the ame material This compromise formation resulted in an ambiguous dream content but, owing to the mutual inhibition of the opposites, in an indifferent emotional tone

According to the theory of wish fulfilment this dream would not have been possible had not the opposed and indeed suppressed yet pleasure emphasized me alomaniac train of thought been added to the thoughts of di gust. For nothing painful is intended to be repre sented in dreams the painful elements of our daily thoughts are able to force their way into our dreams only if at the same time they are able to disguise a wish fulfilment

The dream work is able to dispose of the affects of the dream thou hts in yet another way than by admitting them or reducing them to zero *It can transform them into their op posites* We are acquainted with the rule that for the purposes of interpretation every ele ment of the dream may represent its opposite, as well as itself One can never tell beforehand which is to be posited only the context can decide this point A suspicion of this state of affairs has evidently found its way into the popular consciousness the dream books in their interpretations often proceed according to the principle of contraries This transformation into the contrary is made possible by the inti mate associative ties which in our thoughts connect the idea of a thing with that of its *opposite Like every other displacement* this serves the purpos s of the censorship but it is often the work of wish fulfilment for wish ful *filment* consists in nothing more than the ub stitution of an unwelcome thing by its oppo ite Just as concrete images may be transformed into their contraries in our dreams so also may the affects of the dream thoughts and it is probable that this inversion of affects is usually brought about by the dream censorship The *suppression and inversion of affects* is u eful even in social life as is shown by the familiar analogy of the dream-censorship and above all, hypocrisy If I am conversing with a per on to whom I must show consideration while I should like to address him as an enemy it is almo t more important that I should conceal th ex pression of my affect from him than that I should modify the verbal expression of my

¹ Cf th d e m abo t Co t Th l t sce

thoughts. If I ddress him in courteous terms but accompany them by looks or gestures of hatred and disdain the effect which I produce upo him is not very different from what it would have been had I cast my unmitigated co t mpt i..to his face. Above all then the censor hip b ds me suppress my affects and if I am a master f the art of d s..imulation I can hypocritically displa the oppo te affect—smiling where I hould like to be angry and pretending aff cti n where I should li e to destroy

We have already had an excellent example of ..ch an in ersion of affect in the ervice of the dream-ce sorship In the dream *of my un le's beard* I feel great affect on for my friend R, while (and because) the dre m tho ghts berate him s a simpleton. From this example of the in rs n of affects we deri ed our first proof of the ex tence of the censor ship E en here t is not n c ssary to assume that th d eam wo k creates c unter affect of thi kind that is altogether n w it usually finds it lying ready in the m terial of the dream-th ughts and merely inten..ifies t w th th psychi f rce f the d fence moti s u til it is bl to predominate in th dream forma t I the dream of my uncle the affection

cular n ture of my ea liest childhood p en es the relation of uncle and neph w has become th sou e f all my fri nd hips and h t eds (cf analys s on pp 304 5 above)

An e ellent exampl of such a rev rsal of affect found n a dream rec d d by Fere c zi. An elderly gentl m was awak ned at night by his wif who was frightened beca e h laughed lo dly and un ont ollably in his leep Th m ft rwards related that he had had the f llowing d eam *I l y my bed a gen..lem k own t m c me I wa ted to* — ter which hook me up he thought.

Analyt cally cons dered the dream looks less comical In the latent dream thoughts the *gentlema known* to him who came into the room is the image of death as the great unknown which was awakened in his mind on the p evi ous day The old gentleman who suffers from arteriosclero is had g od re son to think of death on the day before the dream The unco trollable laughter takes the place of weeping and obbing at the idea that he has to d e It is the l ght of l fe that he is no long r able to turn on This mournful tho ght may have as sociated itself w th a fa lure to effect sexual i tercourse which he had attempted shortly before this and in which the a. ista ce of his w fe *en négl gé* was of no a a l he realized that h was already on the decl n The dream work kn w h w to transform the sad idea of impotence and de th nto a comic cene and the sobbing to lau hter

There s one cla s of dreams which has a special claim to be called *hypocri ical* and wh ch se erely tests the theory of wish fulfilment My attention was called to th m when Frau Dr M Hilfe ding p opo ed for d scus ion by the Psy choanalytic Society of Vienna a dream recorded by Ro gger whi h is here reprinted

In *W ldhe mat* vol xi Rosegger writes as follows in h s tory *F emd gemacht* (p 303)

I u..ually e joy healthful sleep yet I have go e without repo e on many a night in addi tion to my modest existence as a student and literary ma I ha e for lo g ye rs dra..ged ut the hadow of a veritable ta'lor's l fe—like a ghost from which I could not become d vo ced

It is not true that I ha e occup ed myself very often or ery intensely with thoughts of my pa t during the day A stormer of he en and earth who has escaped from the hide of the Phil t e has other thi gs to think about. And as a gay young fellow I hardly gave a th ught to my nocturnal dreams only later when I had f rm d the hab t of thinki g about everything o when the Philist ne within me began to a ert itself a l ttl did it strike me that—when I d eamed at all—I was lways a journeyman tailor and that in that capacity I had already work d in my m ter s shop for a l g time with ut a y pay As I sat there be side him and sew d and p essed I was per fectly well aw re that I no l ger belo ged th e d that as a burg s of the town I had ther things to attend to but I was alw ys on a holid y way in th country and I sat bes de my master and helped him. I often felt

day the man was xtremely dep es d and uff red f om head h From too m h laugh

O Rank has called my attention to the fact that in Grimm s fairy tale of the valiant little tailor or *Seve at One Stroke* there is related a very s m lar dream of an upstart The ta lor who has become a hero and has married the king s daughter dreams *one night* wh le lyi g bes de the princess his wife about his trade having become su picious on the following night she *places armed guards* where they can listen to what is sa d by the dreamer and ar rest h m But the little ta lor is warned and is *able to correct his dream*

The complicated processes of removal d mi nutio and n ers o by which the affects of the dream thoughts finally become the affects of the dream may be ery well surveyed in su t able synthe es of completely analysed dreams. I shall here discu s a few examples of affecti e man festat ons n dreams which will I th nk prove this conclusively in some of the cases cited.

V

In the dream about the odd task which the elder Bruck sets me—that of preparing my own pel s—I am aware in the dream itself of not feeling *appropriate horror* Now this is a wish fulfilment in more senses than one The p eparation s gnifies the self analyses which I pe form as t we e by publ hing my book on dreams wh ch I *actually found* so painful th t I postpo ed the printing of the completed manuscript for more than a year The wish now arises that I may disregard *this feeli g of aver s o* and for that rea on I feel no horror (*G a en* which also means *to grow grey*) in the dre m I should m ch like to escape *G a en* in the other sense too for I am already grow ing quite grey and the grey in my hair w rns me to delay no longer For we know that at the end of the dream this thought secu es rep-resentat o I shall have to leave my children t reach the goal of th r difficult journey w th out my help

In the two dreams that transfer th expres s on of satisfaction t the moments immedi ately *after* waki g th sat sfact n is in the ne case moti ated by the expectat on that I am now going to learn what is meant by *I have al ady d med of this* a d refers real ty to the birth of my first child and in th other case t is mot vated by the c n ct on that that which has b en anno c d by premoni t ry sign is now going to happen and th sat i f cti is that which I felt on the arrival of my s cond son. Here the same affe ts that

far from comfortable about it and regretted the waste of time which I might have employed for better and more useful purposes If anything was not quite correct in measure and cut I had to put up with a scolding from my master Of wages there was never a question Often as I sat with bent back in the dark workshop I decided to give notice and make myself scarce Once I actually did so but the master took no notice of me and next time I was sitting beside him again and sewing

How happy I was when I woke up after such weary hours! And I then resolved that if this intrusive dream should ever occur again I would energetically throw it off and would cry aloud It is only a delusion I am lying in bed and I want to sleep And the next night I would be sitting in the tailor s shop again

So it went on for years with dismal regularity Once when the master and I were working at Alpelhofer s at the house of the peasant with whom I began my apprenticeship it happened that my master was particularly dissatisfied with my work I should like to know where in the world your thoughts are? he cried and looked at me sullenly I thought the most sensible thing to do would be to get up and explain to the master that I was working with him only as a favour and then take my leave But I did not do this I even submitted when the master engaged an apprentice and ordered me to make room for him on the bench I moved into the corner and kept on sewing On the same day another journeyman was engaged a bigoted fellow he was the Bohemian who had worked for us nineteen years earlier and then had fallen into the lake on his way home from the public house When he tried to sit down there was no room for him I looked at the master inquiringly and he said to me You have no talent for tailoring *you may go you re a stranger henceforth* My fright on that occasion was so overpowering that I woke

The grey of morning glimmered through the clear windows of my familiar home *Objets d art* surrounded me in the tasteful bookcase stood the eternal Homer the gigantic Dante the incomparable Shakespeare the glorious Goethe—all radiant and immortal From the adjoining room resounded the clear little voices of the children who were waking up and prattling to their mother I felt as though I had rediscovered that idyllically sweet peaceful poetical and spiritualized life in which I have so often and so deeply been conscious of contemplative human happiness And yet I was vexed that I had not given my master notice first but had been dismissed by him

And how remarkable this seems to me since that night when my master made a stranger of me I have enjoyed restful sleep I no longer dream of my tailoring days which now lie in the remote past which in their unpretentious simplicity were really so cheerful, but which none the less have cast a long shadow over the later years of my life

In this series of dreams of a poet who in his younger years had been a journeyman tailor it is hard to recognize the domination of the wish fulfilment All the delightful things occurred in his waking life while the dream seemed to drag along with it the ghost like shadow of an unhappy existence which had long been forgotten Dreams of my own of a similar character enable me to give some explanation of such dreams As a young doctor I worked for a long time in the Chemical Institute without being able to accomplish anything in that exacting science so that in the waking state I never think about this unfruitful and actually somewhat humiliating period of my student days On the other hand I have a recurring dream to the effect that I am working in the laboratory making analyses and experiments and so forth these dreams like the examination dreams are disagreeable and they are never very distinct During the analysis of one of these dreams my attention was directed to the word *analysis* which gave me the key to an understanding of them Since then I have become an *analyst* I make analyses which are greatly praised—psycho analyses of course Now I understand when I feel proud of these analyses in my waking life and feel inclined to boast of my achievements my dreams hold up to me at night those other unsuccessful analyses of which I have no reason to be proud they are the punitive dreams of the upstart, like those of the journeyman tailor who became a celebrated poet But how is it possible for a dream to place itself at the service of self-criticism in its conflict with parvenu pride and to take as its content a rational warning instead of a prohibited wish fulfilment? I have already hinted that the answer to this question presents many difficulties We may conclude that the foundation of the dream consisted at first of an arrogant phantasy of ambition but that in its stead only its suppression and abasement has reached the dream content. One must remember that there are masochistic

trap of words. At the end of the dream I am greatly pleased and am quite ready to believe in a possibility which I recognize as absurd when I am awake, namely, that there are revenants who can be swept away by a mere wish.

I have not yet mentioned the occasion of this dream. It is an important one, and leads us far down into the meaning of the dream. From my friend in Berlin (whom I have designated as Fl.) I had received the news that he was about to undergo an operation, and that relatives of his living in Vienna would inform me as to his condition. The first few messages after the operation were not very reassuring, and caused me great anxiety. I should have liked to go to him myself, but at that time I was afflicted with a painful complaint which made every movement a torment. I now learn from the dream-thoughts that I feared for the dear friend's life. I knew that his only sister, with whom I had never been acquainted, had died young, after a very brief illness. (*In the dream Fl. talks about his sister and says: "In three quarters of an hour she was dead."*) I must have imagined that his own constitution was not much stronger, and that I should soon be travelling, in spite of my health, in response to far worse news—and that I should arrive too late, for which I should eternally reproach myself. This reproach, that I should arrive too late, has become the central point of the dream, but it has been represented in a scene in which the revered teacher of my student years—Brücke—reproaches me for the same thing with a terrible look from his blue eyes. What brought about this alteration of the scene will soon become apparent; the dream cannot reproduce the scene itself as I experienced it. To be sure, it leaves the blue eyes to the other man, but it gives me the part of the annihilator, an inversion which is obviously the work of the wish-fulfilment. My concern for the life of my friend, my self-reproach for not having gone to him, my shame (*he had come to me in Vienna unobtrusively*), my desire to consider myself excused on account of my illness—all this builds up an emotional tempest which is distinctly felt in my sleep, and which rages in that region of the dream-thoughts.

But there was another thing in the occasion of the dream which had quite the opposite effect. With the unfavourable news during the first days of the operation I received also an injunction to speak to no one about the whole affair, which hurt my feelings, for it betrayed an unnecessary distrust of my discretion. I knew, of course, that this request did not proceed from my friend, but that it was due to clumsiness or excessive timidity on the part of the messenger, yet the concealed reproach affected me very disagreeably, because it was not altogether unjustified. As we know, only reproaches which *have something in them* have the power to hurt. Years ago, when I was younger than I am now, I knew two men who were friends, and who honoured me with their friendship, and I quite superfluously told one of them what the other had said of him. This incident, of course, had nothing to do with the affairs of my friend Fl., but I have never forgotten the reproaches to which I had to listen on that occasion. One of the two friends between whom I made trouble was Professor Fleischl; the other one I will call by his baptismal name, *Josef*, a name which was borne also by my friend and antagonist P., who appears in the dream.

In the dream the element unobtrusively points to the reproach that I cannot keep anything to myself, and so does the question of Fl. as to *how much of his affairs I have told P*. But it is the intervention of that old memory which transposes the reproach for arriving too late from the present to the time when I was working in Brücke's laboratory; and by replacing *the second person in the annihilation scene of the dream by* Josef, I enable this scene to represent not only the first reproach—that I have arrived too late—but also that other reproach, more strongly affected by the repression, to the effect that I do not keep secrets. The work of condensation and displacement in this dream, as well as the motives for it, are now obvious.

My present trivial annoyance at the injunction not to divulge secrets draws reinforcement from springs that flow far beneath the surface, and so swells to a stream of hostile impulses towards persons who are in reality dear to me. The source which furnishes the reinforcement is to be found in my childhood. I have already said that my warm friendships as well as my enmities with persons of my own age go back to my childish relations to my nephew, who was a year older than I. In these he had the upper hand, and I early learned how to defend myself; we lived together, were inseparable,

[1] It is this fancy from the unconscious dream-thoughts which peremptorily demands non vivit instead of non vixit: "You have come too late, he is no longer alive." The fact that the manifest situation of the dream aims at the non vivit has been mentioned on page [illegible].

dominated in the dream thoughts have remained in the dream but the process is probably not quite so simple as this in any dream If the two analyses are examined a little more closely it will be seen that this satisfaction which does not succumb to the censorship receives r [illegible] fear th [illegible] certain [illegible] it had not screened it elf by a similar and readily admitted affect of satisfaction from the permitted source and had so to speak sneaked in behind it I am unfortunately unable to show this in the case of the actual dream but an example from another situation will make my meaning intelligible I will put the following case Let there be a person near me whom I hate so strongly that I have a lively impulse to rejoice should anything happen to him But the moral side of my nature does not give way to this impulse I do not dare to express this sinister wish and when something does happen to him which he does not deserve I suppress my satisfaction and force myself to thou hts and expressions of regret Everyone will at some time have found himself in such a position But now let it happen that the hated person throu h some transgression of his own draws upon himself a well deserved calamity I shall now be allowed to give free rein to my satisfaction at his being visited by a just punishment and I shall be expressing an opinion which coincides with that of other impartial persons But I observe that my satisfaction proves to be more intense than that of others for it has received reinforcement from another source—from my hatred which was hitherto prevented by the inner censorship from furnishing the affect but which under the altered circumstances is no longer prevented from doing so This case generally occurs in social life when antipathetic persons or the adherents of an unpopular minority have been guilty of some offence Their punishment is then usually commensurate not [illegible] injustice but they are prevented from becoming aware of it by the satisfaction arising from the release within themselves of a suppression of long standing In such cases the quality of the affect is justified but not its degree and the self criticism that has been appeased in respect of the first point is only too ready to neglect to scrutinize the second point Once you have opened the doors more people enter than it was your original intention to admit

A striking feature of the neurotic character namely that in it causes capable of evoking affect produce results which are qualitatively justified but quantitatively excessive is to be explained on these lines in so far as it admits of a psychological explanation at all But the excess of affect proceeds from unconscious and hitherto suppressed affective sources which are able to establish an associative connection with the actual occasion and for whose liberation of affect the unprotested and permitted source of affects opens up the desired path Our attention is thus called to the fact that the relation of mut [illegible] hen the two institutions bring about a pathological result by co operation and mutual reinforcement deserve just as much attention These hints re arding the psychic mechanism will contribute to our understanding of the expressions of affects in dreams A gratification which makes its appearance in a dream and which of course may readily be found in its proper place in the dream thoughts may not always be fully explained by means of this reference As a rule it is necessary to search for a second source in the dream thoughts upon which the pressure of the censorship rests and which under this pressure would have yielded not gratification but the contrary affect had it not been enabled by the presence of the first dream source to free its gratification affect from repression and reinforce the gratification springing from the other source Hence affects which appear in dreams appear to be formed by the confluence of several tributaries and are over determined in respect of the material of the dream thoughts *Sources of affect which are able to furnish the same affect combine in the d eam work in order to produce it*

Some insight into these involved relations is gained from the analysis of the admirable dream in which *Non vixit* constitutes the central point (cf p 304) In this dream expressions of affect of different qualities are concentrated at two points in the manifest content. Hostile and painful impulses (in the dream itself we have the phra e *overcome by strange emotions*) overlap one another at the point where I destroy my antagonistic friend with a

I have [illegible] xpl i ed th [illegible] tra rd [illegible] ry ffect of pl [illegible] p od ced by te d cy w t o [illegible] al gous lines.

coup e of words. At the end of the dream I am greatly plea ed and am quit ready to believe in a pos bil y which I recognize as ab urd when I am awake namel that there are reve nants who can be swept awa by a mere wish.

I have not yet mentio ed the occa ion of this

My pre ent tri ial annoyance at the i j nc t on not t divulge secrets draws re f cement f m prings that flow far beneath the surface and o swell to a stream of hostile mp lses

enm ti s w th pers ns of my own age go back to my childh h relat ons to my nephew who was a year lder th n I In th se he had th uppe hand and I ea ly learn d h w to defe d myself we lived t gether w re inseparable,

I is t is fancy from the unconscious dream-thou ts hich peremptorily demands non vivit in ead f non vixit You have come too late he is no l ger live. The fact tha the manifes situation f the dream aims at the non vivit has been mentioned page s

and loved one another but at times as the statements of older persons testify we used to squabble and *accuse* one another In a certain sense all my friends are incarnations of this first figure they are all *revenants* My nephew himself returned when a young man and then we were like Caesar and Brutus An intimate friend and a hated enemy have always been indispensable to my emotional life I have always been able to create them anew and not infrequently my childish ideal has been so closely approached that friend and enemy have coincided in the same person but not simultaneously of course nor in constant alternation as was the case in my early childhood

How when such associations exist a recent occasion of emotion may cast back to the infantile occasion and substitute this as a cause of affect I shall not consider now Such an investigation would properly belong to the psychology of unconscious thou ht or a psychological explanation of the neuroses Let us assume for the purposes of dream interpretation that a childish recollection presents itself or is created by the phantasy with more or less the following content We two children quarrel on account of some object—just what we shall leave undecided although the memory or illusion of memory has a very definite object in view—and each claims that *he got there first* and therefore has the first right to it We come to blows Might comes before Right and according to the indications of the dream I must have known that I was in the wrong (*noticing the error myself*) but this time I am the stronger and take possession of the battlefield the defeated combatant hurries to my father his grandfather and accuses me and I defend myself with the words which I have heard from my father *I hit him because he hit me* Thus this recollection or more probably phantasy which forces itself upon my attention in the course of the analysis—without further evidence I myself do not know how—becomes a central item of the dream thoughts which collects the affective impulses prevailing in the dream thoughts as the bowl of a fountain collects the water that flows into it From this point the dre

ing channels

had to make

push me off r I don t need you I ll soon find someone else to play with etc Then the channels are opened through which these thoughts flow back again into the dream representation

For such an *ote toi que je m y mette* I once had to reproach my deceased friend Josef He was next to me in the line of promotion in Brucke s laboratory but advancement there was very slow Neither of the two assistants budged from his place and youth became impatient My friend who knew that his days were numbered and was bound by no intimate relation to his superior sometimes gave free expression to his impatience As this superior was a man seriously ill the wish to see him removed by promotion was susceptible of an obnoxious secondary interpretation Several years earlier to be sure I myself had cherished even more intensely the same wish—to obtain a post which had fallen vacant wherever there are gradations of rank and promotion the way is opened for the suppression of covetous wishes Shakespeare s Prince Hal cannot rid himself of the temptation to see how the crown fits even at the bedside of his sick father But as may readily be understood the dream inflicts this inconsiderate wish not upon me but upon my friend

As he was ambitious I slew him As he could not expect that the other man would make way for him the man himself has been put out of the way I harbour these thoughts immediately after attending the unveiling of the memorial to the other man at the University Part of the satisfaction which I feel in the dream may therefore be interpreted A just punishment it serves you right

At the funeral of this friend a young man made the following remark which seemed rather out of place The preacher talked as though the world could no longer exist without this one human being Here was a stirring of revolt in the heart of a sincere man whose grief had been disturbed by exaggeration But with this speech are connected the dream thoughts No one is really irreplaceable how many men have I already escorted to the grave! But I am still alive I have survived them all I claim the field Such a thought at the moment when I fear that if I make a journey to see him I shall find my friend no longer among the living permits only of the further development that I am glad once more to have survived someone that it is not *I* who have died but he that I am master of the field as

M k m f m —Ed
It w ll b bee b th t th m *I* *I*
pl y g t p t my d m (ee th d m bout *my cl)* It i p t l ly f m t h d my

once I was in the imagined scene of my child hood. This satisfaction infantile in origin at th fact that I am ma.ter of the field co ers the greater part of the affect which appears in the dream I am glad that I am the survi or I xpres th s sent me t w th the nai e egoism of the husband who says to hi wife If one of us dies I shall move to Paris My expec tati takes it as a matter f course that I am ot the o e to d e

It cann t be d nied that great self control is eed d to interp et ne s dreams a d to re port them. One has t reveal o e elf as the sole villain among all the noble ouls w th wh m o e shares th breath of life Thus I find t qu te comprehensible that evena ts should exist nly as l ng as o e wants them and that they can be bliterated by a wish. It was for this reason that my frie d Jo ef was p enants are the successi e

tut will doubtless soon be f und ev n for the f end wh m I am ow on the point of lo ing is irreplaceable

But what has the dream ens hip been d ing i the meantime? Why does t not ra se the most emphatic obj ctio to a train of

sati f ct on and with the r ffect co that p ceeding f m the f b dden infantile sources In another strat m of tho ght I sa d t mys lf at the e mony of nveiling the m morial I ha e lost s ma y dea fri d some through death some thr ugh the di.sol tion of fri nd h.p t not good that substitutes ha e p ese ted themsel that I h e gained a f d wh m ans m to me than the others co ld d whom I hall n w lways retain t an g wh t is not easy t f rm ew fri nd ships Th grat ficat on f having f und this s bst t t f my lost frie d can be taken over int th d am without inte f en e b t be hi d t ther sneaks in th h st le feeling of malic ou grat ficati n from th f til so e Child h ff cti undoubt dly h lp t ein fo the rational ff ct on f t day but childi h hatred also ha f und ts w y int th rep esent t n.

B t bes des this th re is in th dream a d t ct ref rence to an th r train f thoughts wh ch may result in gratification Some time before this after long waitin a l ttle daughter was born to my friend I knew how he had grie ed for the sister wh m he had lost at an early age and I wrote to him that I felt that he would transfer to this child the lo e he had felt for her that this little girl would at last make him forget his irreparable loss

Thus th s train also connects up with the intermedi ry thoughts of the latent dream conte t from which paths radiate in the most contrary direct ons No one is irreplace ble See here are only reve ants all those whom one has lost return And now the bonds of association between the contradictory compo ne ts of the dream thoughts are more tightly drawn by the accidental circumstance that my frie d s little daughter bears the same name as the gi l playmate of my own youth who was just my own age and the sister of my oldest friend and antagonist I heard the name *Pauline* with *satisfact on* a d in order to allude to this co nc dence I replaced one Jo ef in the dream by another Josef and found it impossible to suppress the identical in tials in the name Fle schl and Fl From this po nt a train of thought runs to the naming of my own chil dren. I insi ted that the names should not be chosen according to the fash on of the day but should be determined by reg d f r the memory of those dea to us The child en s names make them *revenants* And fi ally is not th pro creat o of children for all men the only way of access to mmortality?

I shall add only a few observations as to the affects f dreams co sidered from another po t of v ew *In the psyche of the sleeper an affec* ti e te dency—what we call a mood—may be contain d as its dominating eleme t and may duce a *corresponding mood in the dream* This mood may be the result of the experiences d thoughts of the d y or t may be of somatic origin in e ther c se it will be ccompan ed by the correspo d ng train f thought. That this ideational c ntent of th dream thoughts sh uld t one tim d t rmine the ffecti e tende cy primarily while at a other time it s w kened in a seco dary man er by the som ti cally d t rmi d m t onal disposition s m diff rent for the p rposes f dream f rm ti Th s is always subject to the re triction that t can represe t nly a wi h fulfilment, nd that t m y l d its psychic n rgy to the wish alo e Th mood actually p se t will rece the sam t eatme t th nsat on wh ch actually emerges d ing sleep (cf p 234)

which is either neglected or reinterpreted in the sense of a wish fulfilment Painful moods during sleep become the motive force of the dream inasmuch as they awake energetic wishes which the dream has to fulfil The *material in* which they inhere is elaborated until it is serviceable for the expression of the wish fulfilment The more intense and the more dominating the element of the painful mood in the dream thoughts the more surely will the most strongly suppressed wish impulses take advantage of the opportunity to secure representation for thanks to the actual existence of discomfort which otherwise they would have to create spontaneously they find that the more difficult part of the work necessary to ensure representation has already been accomplished and with these observations we touch once more upon the problem of anxiety dreams which will prove to be the boundary case of dream activity

I The Secondary Elaboration

We will at last turn our attention to the fourth of the factors participating in dream formation

If we continue our investigation of the dream-content on the lines already laid down—that is by examining the origin in the dream thoughts of conspicuous occurrences—we come upon elements that can be explained only by making an entirely new assumption I have in mind cases where one manifests astonishment anger or resistance in a dream and that too in respect of part of the dream content itself Most of these impulses of criticism in dreams are not directed against the dream content but prove to be part of the dream material taken over and fittingly applied as I have already *shown by suitable examples* There are however criticisms of this sort which are not so derived their correlatives cannot be found in the dream material What for instance is meant by the criticism not infrequent in dreams After all it s only a dream ? This is a genuine criticism of the dream such as I might make if I were awake Not infrequently it is only the prelude to waking even oftener it is preceded *by a painful feeling which sub*sides when the actuality of the dream state has been affirmed The thought After all it s only a dream in the dream itself has the same intention as it has on the stage on the lips of Offenbach s *Belle Hélène* it seeks to minimize what has just been experienced and to secure indulgence for what is to follow It serves to lull to sleep a certain mental agency which at the given moment has every occasion to rouse itself and forbid the continuation of the dream, or the scene But it is more convenient to go on sleeping and to tolerate the dream because *after all it s only a dream* I imagine that the disparaging criticism After all it s only a dream appears in the dream at the moment when the censorship which is never quite asleep *feels that it has been surprised by the* already admitted dream It is too late to suppress the dream and the agency therefore meets with this remark the anxiety or painful emotion which rises into the dream It is an expression of the *esprit d escalier* on the part of the psychic censorship

In this example we have incontestable proof that everything which the dream contains does not come from the dream thou hts but that a psychic function which cannot be differentiated from our waking thoughts may make contributions to the dream content. The question arises does this occur only *in exceptional* cases or does the psychic agency which is otherwise active only as the cen orship play a constant part in dream formation?

One must decide unhesitatingly for the latter view It is indisputable that the censoring agency whose influence we have so far recognized only in the restrictions of and omis ions in the dream content is likewise responsible for interpolations in and amplifications of this content Often these interpolations are readily recognized they are introduced with hesitation prefaced by an as if they have no special vitality of their own and are *constantly in*erted at points where they may serve to connect two portions of the dream content or create a continuity between two sections of the dream They manifest less ability to adhere in the memory than do the genuine products of the dream material if the dream is forgotten they are forgotten first and I strongly su pect that our frequent complaint that althou h we have dreamed so much we have forgotten most of the dream and have remembered only fragments is explained by the immediate falling away of just these cementing thoughts In a *complete analysis these interpolations* are often betrayed by the fact that no material is to be found for them in the dream thoughts But after careful examination I must describe this case as the less usual one in most ca es the interpolated thou hts can be traced to material in the dream thoughts which can claim a place in the dream neither by its own merits nor by way of over-determination Only in the

most extreme cases does the psychic *function* in dream formation which we are now con ..dering rise to original creation whenever pos..b e it makes use of an thing appropriate that it can find in the dream material

What distinguishes this part of the dream ... Th

orts is that the dream loses the *appearance* of bsurdity and incoherenc and pproaches the pa tern of an i telli..ible experience. But the e rt is not always cr wned with complet success. Thus, dreams occur which may upon superficial examinat on seem faultles..ly logical and correct they start from poss bl situa tion, contin e t by means f consistent cha..ges and bri t—although this is rare— t not unnat ral c clusi n. These dre ms have been subjected to th most earching elaboration by a psychic function similar to our waking th u ht they seem to ha e a meanin.. b.. thi meaning is ery fa remo ed f om the real meanin.. of the dream. If we analyse them, we are con ced that the seco dary elaborati has handled the m terial with t.. greatest freedom and has retained s little as pos..bl of ..s proper relati s These are the dreams which ha e, so t speak, already been once interpreted before we subject them t wak..ng int rpretation In oth dreams this tendencious elaboration has su ceeded only p to a point up t this po t con.. tency seems to prevail, but then the dream becomes non se.. cal o onfused but pe haps before it con ludes t may o e more ise to a semblance of rationalit In yet ..her dreams the elaboration has failed compl t ly w find rselves helpless co fronted with a senseless mass f fragme tary co tents

I d ot wi..h to d y to this fo rth dream f rming pow which will soon *becom f miliar to us—it is in reality the o ly on* f the f ur dream-creating factors which is familia t us in other *c nne tions*—I d t w sh t den t this fourth f cto the f culty f crea tively maki g ew co tributi ns to o r dreams B t t infl en is c rtainly exerted like that f the other f ctors mainly in the pref d selecti f psychic mat rial alre dy form d in th dream thou hts Now th re a se where t t great exten pared the work f buildi g as t w re faça e t the dream by the f ct th..t ch s ruct re only waitin to be u..ed already exists in the ma terial of the dream-thou hts I am accustomed *to describe* the element of the dream thoughts which I have in m d as *phantasy* I shall per haps a oid misunder tand..ng if I at once point to the *day-dream* as an analogy in waking l fe The part played by th s element i our psychic Lfe has not yet been fully recognized and re ealed by psychiatrists though M Benedikt has, it eems to me made a h ghly p om n beginning Yet the s gnificance of the da -d eam has not escaped the unerring in..ight of the poets we are all *familiar* with th description of the day-dreams of o e of his subord nate characters wh h Alphonse Daudet has gi en us in his *Nabab* The study of the psychoneu roses di closes the astonishing fact th..t these phanta.. es or d y-dreams are the immediate predecessors of symptoms of hysteria—at least of a great many of them for hyst rical symptoms are dependent not upon actual m m orie but upo the phantasies built up on a basis of memori s The frequent occurrence of conscious day phantas es brings these forma tions to our ken but while some of these phantasies are conscious, there is a super abunda ce of unconscious phantas es which mu t perf ce remain unconsci us on account of their co tent and their origin in repressed material. A more th rough examination of the character f these day phantas es shows with what good reason the same name has been given to these f rmati ns s to th prod cts of noc turnal thought—*d eams* They ha e essenti l features n common with nocturnal dream indeed the in estigation of da -dreams m ght really have afforded the shortest and best app oach to the understanding of nocturnal dreams

Like dreams, they are wish fulfilments like dreams they are largely based upo the im pressio s of childi h experiences like dreams they btain a certain ind lgence from th cen rship in respect of th r creations If we tra th form tion we be ome ware h w th wi h m tive which has been operative in th prod ction has taken the material of which they are built, mixed t together re rranged t and fitted it together into a new wh le Th y bear very m ch the same relat on to the hildi..h mem ries t which they refer a many f th b roq pa..aces of Rom bea to the ancient ruins whose hewn stones and colur ha furni..hed the mat rial for the structures built in the modern styl

Rêve pe em =day-dream tory

In the *secondary elaboration* of the dream content which we have ascribed to our fourth dream forming factor we find once more the very same activity which is allowed to manifest it elf uninhibited by other influences in the creation of day dreams We may say without further preliminaries that this fourth factor of ours seeks to construct *something like* a day dream from the material which offers it self But where such a day dream has already been constructed in the context of the dream thoughts this factor of the dream work will prefer to take possession of it and contrive that it gets into the dream content There are dreams that consist merely of the repetition of a day phantasy which has perhaps remained unconscious—as for instance the boy s dream that he is riding in a war chariot with the heroes of the Trojan war In my *Autodidasker* dream the second part of the dream at least is the faithful repetition of a day phantasy—harmless in itself—of my dealings with Pro fessor N The fact that the exciting phantasy forms only a part of the dream or that only a part of it finds its way into the dream con tent is due to the complexity of the conditions which the dream must satisfy at its genesis On the whole the phantasy is treated like any other component of the latent material but it is often still recognizable as a whole in the dream In my dreams there are often parts which are brought into prominence by their producing a different impression from that produced by the other parts They seem to me to be in a state of flux to be more coherent and at the same time more transient than other portions of the same dream I know that these are unconscious phantasies which find their way into the context of the dream but I have never yet succeeded in registering such a phantasy For the rest these phantasies like all the other component parts of the dream thoughts are jumbled together condensed superimposed and so on but we find all the transitional stages from the case in which they may con stitute the dream content or at least the dream façade unaltered to the most contrary case in which they are represented in the dream content by only one of their elements or by a remote allusion to such an element The fate of the phantasies in the dream thoughts is ob viously determined by the advantages they can offer as against the claims of the censorship and the pressure of condensation

In my choice of examples for dream inter pretation I have as far as possible avoided those dreams in which unconscious phantasies play a considerable part because the introduc tion of this psychic element would have necessitated an extensive discussion of the p y chology of unconscious thou ht But even in this connection I cannot entirely avoid the *phantasy* because it often finds its way into the dream complete and still more often per ceptibly glimmers through it I might mention yet one more dream which seems to be com posed of two distinct and opposed phantasies, overlapping here and there of which the first is superficial while the second becomes as it were the interpretation of the first

The dream—it is the only one of which I possess no careful notes—is roughly to this effect *The dreamer—a young unmarried man—is sitting in his favourite inn which is seen correctly several persons come to fetch him among them someone who wants to arrest him He says to his table companions I will pay later I am coming back But they cry smil ng scornfully We know all about that that s what everybody says One guest calls after him There goes another one He is then led to a small place where he finds a woman with a child in her arms One of his escorts says This is Herr Muller A commissioner or some other official is running through a bundle of tickets or papers repeating Muller Muller Muller At last the commissioner asks him a question which he answers with a Yes He then takes a look at the woman and notices that she has grown a large beard*

The two component parts are here easily separable What is superficial is the *phantasy of being arrested* this seems to be newly cre ated by the dream work But behind it the *phantasy of marriage* is visible and this ma terial on the other hand has been slightly modified by the dream work and the features which may be common to the two phanta ies appear with special distinctness as in Galton s composite photographs The promise of the young man who is at present a bachelor to

I h e a lys d e ll t mpl f dre f th k d h g ts g th t t f t of e l ph t th *F gm l l A l* f *C f Hy t (C ll t d P pers* l III) f d l d th s g lf f s h phant es f d m f m t l g I was w k g p pally o my w d m wh h w ly b sed mos d y-d m b t m t f q tl

return to his place at his accu tomed table—the cepticism of h s drinking companions mad wise by the r many xperie c s—their calling after him *There goes (marri s) a other on* —are all featu es easily suscept ble of the other interpretation as is the affirmative answer gi en to the offic al Running through a bundle of papers and repeating the same name c rre po ds to a subordi ate but easily recog nized f atur of the marriage ceremony—the reading aloud of the c ngratul tory telegrams ... intervals and ... ame ... onde ... e en ... hich cree t The fa t th t this bride fina y wears a beard I can xplain from informati n recei ed —I had n opportunity of making an nalysis The dreamer had on the pre ous d y been tr ssing the stre t with a frie d wh was just s hostile to marriag a himself and had called hi friend s atte tion to beautiful brunett wh was comi g towa ds them The f end h d rema ked Yes f only these wome wouldn t get beard as they gr w lder lik th f thers

Of o rs even in thi dre m there is no la k of l me ts with which the dream-distor ti has d e deep w k. Th s the speech *I will pay later* may ha e refe nc t the be-havi ur feared th part of the father in law in the matte of d wry Ob usly all sorts of mi gi gs are p eve t g th dreamer from surre d ring himself w th pleasu e to the pha *tasy f marri ge* One of thes mi gi gs—that with marri ge he m ght lose hi f edom—has embodi d t lf in the transf rmati n of a scene of rrest

tween the falling of the board on Maury s cervical vertebrae a d the waking induced by the blow We should not venture to ascribe *such rap d ty* to the mental operations of the wak ng state o that we have to adm t that the dream wo k has the pri ilege of a remark able acceleration of its issue

To this conclus on which rapidly became popular more recent authors (*Le Lorrain* Egger and others) ha e opposed emphatic ob-ject ons some of them doubt the correctness of Maury's record of the dream some seek to show that the rap d ty of our mental operat ons in waking life is by no means inferior to that wh ch we can without reservat on ascribe to the m ntal operations i dreams The discus-sion ra ses fundamental que tio s which I do not th nk are at all near solution But I must co fess that Egger's objections for example to M urys dream of the gu llotine do not impress me as convincing I would suggest the follow ng expla ation of this dream Is it o very improbable that Maury s dream may ha e represented a phantasy which had been pre served for years in his memory in a completed state and which was awakened—I should l ke to say all ded to—at th moment when he became aware of the w king stimulus? The whol difficulty of compo g so lo g a story with all its details in the e ceed gly short space of tim which s h e at the dreamer s dispos l then disappears the story was alre dy compo ed If the board h d struck Maury s ne k whe he wa awak there would pe haps ha bee t me f r the thought Why that s ju t like bei g guillotined But as he is struck by th boa d while a le p the dream wo k quickly uti es the *coming st mul s for the* construct on of a wish f lfilment *as f* t

u d iabl that th dr am roma ce ju t such a o e s a young man is wo t t construct unde the fl ence of excit g mpress ons Who h s not be fascin t d—abo e all a F chman a d a stud nt of the history of civiliz t n—by de cripti of the Re gn of Terror in wh h the aristocracy m n and w me th flow r of the nati n h wed that it w s poss ble t d with a light heart and p e rved th r re dy wit and th refinem t of th manners up to the m ment of th last f t ful summons? How tempting t fancy

If in the mid t f all thi as ne of these

young men who take leave of their ladies with a ki s of the hand and fearlessly ascend the scaffold! Or perhaps ambition was the ruling motive of the phantasy—the ambition to put oneself in the place of one of those powerful personalities who by their sheer force of in tellect and their fiery eloquence ruled the city in which the heart of mankind was then beat ing so convulsively who were impelled by their convictions to send thousands of human beings to their death and were paving the way for the transformation of Europe who in the meantime were not sure of their own heads and might one day lay them under the knife of the guillotine perhaps in the role of a Girondist or the hero Danton? The detail pre served in the memory of the dream *accom panied by an enormous crowd* seems to show that Maury s phantasy was an ambitious one of just this character

But the phantasy prepared so long ago need not be experienced again in sleep it is enou h that it should be so to speak touched off What I mean is this If a few notes are struck and someone says as in *Don Juan* That is from *The Marriage of Figaro* by Mozart memories suddenly surge up within me none of which I can recall to consciousness a mo ment later The phrase serves as a point of irruption from which a complete whole is simultaneously put into a condition of stimu lation It may well be the same in unconscious thinking Through the waking stimulus the psy chic station is excited which gives access to the whole guillotine phantasy This phantasy *however is not run through in sleep but only* in the memory of the awakened sleeper Upon waking the sleeper remembers in detail the phantasy which was transferred as a whole in to the dream At the same time he has no means of assuring himself that he is really re membering something which was dreamed The ame explanation—namely that one is dealing with finished phantasies which have been evoked as wholes by the waking stimulus—may be applied to other dreams which are adapted to the waking stimulus—for example to Napoleon s dream of a battle before the explosion of a bomb Among the dreams col lected by Justine Tobowolska in her disserta tion on the apparent duration of time in dreams I think the most corroborative is that related by Macario (1857) as having been dreamed by a playwright Casimir Bonjour

J t Tobowolska *Et d l ll d temp dans les co s du somm il o m l* (19) p 53

Bonjour intended one evening to witness the first performance of one of his own plays but he was so tired that he dozed off in his chair behind the scenes just as the curtain was ris ing In his sleep he went through all the five acts of his play and observed all the various signs of emotion which were manifested by the audience during each individual scene At the close of the performance to his great satisfac tion he heard his name called out amidst the most lively manifestations of applau e Sud denly he woke He could hardly believe his eyes or his ears the performance had not gone beyond the first lines of the first scene he could not have been asleep for more than two minutes As for the dream the runnin through the five acts of the play and the observing the attitude of the public towards each individ ual scene need not we may venture to a ert, have been something new produced while the dreamer was asleep it may have been a repetition of an already completed work of the phantasy Tobowolska and other th re h

n au like other dreams and that the dreamer s memory of them is summary rather than detailed But the e are precisely the char acteristics which would necessarily be exhib ited by ready made phantasies touched off by the dream work—a conclusion which is not of course drawn by these authors I do not mean to assert that all dreams due to a waking stim ulus admit of this explanation or that the *problem of the accelerated flux of ideas* in dreams is entirely dispo ed of in this manner

And here we are forced to consider the re lation of this secondary elaboration of the dream content to the other factors of the dream work May not the procedure perhaps be as follows? The dream forming factors the efforts at condensation the necessity of evad ing the censorship and the regard for repre sentability by the psychic means of the dream first of all create from the dream material a provisional dream-content which is subse quently modified until it satisfies as far as possible the exactions of a secondary agency No this is hardly probable We must rather assume that the requirements of this agency constitute from the very first one of the con d tions which the dream must atisfy and that this condition a well as the conditions of con densation the opposing censorsh p and repre sentability simultaneously influence in an in

ductive and selective manner the whole mass of material in the dream-thoughts. But of the four conditions necessary for dream formation the last recognized is that whose exactions appear to be least binding upon the dream. The following consideration makes it seem very probable that this psychic function which undertakes the so-called secondary elaboration of the dream-content, is identical with the work of our waking thought. Our waking (preconscious) thought behaves towards any given perceptual material precisely as the function in question behaves towards the dream-content. It is natural to our waking thought to create order in such material, to construct relations and to subject it to the requirements of an intelligible coherence. Indeed, we go rather too far in this respect; the tricks of conjurers befool us by taking advantage of this intellectual habit of ours. In the effort to combine in an intelligible manner the sensory impressions which present themselves we often commit the most curious mistakes, and even distort the truth of the material before us. The proofs of this fact are so familiar that we need not give them further consideration here. We overlook errors which make nonsense of a printed page because we imagine the proper words. The editor of a widely read French journal is said to have made a bet that he could print the words *from in front* or *from behind* in every sentence of a long article without any of his readers noticing it. He won his bet. Years ago I came across a comical example of false association in a newspaper. After the session of the French Chamber in which Dupuy quelled the panic caused by the explosion of a bomb thrown by an anarchist, with the courageous words *La séance continue*, the visitors in the gallery were asked to testify as to their impressions of the outrage. Among them were two provincials. One of these said that immediately after the end of a speech he had heard a detonation, but that he had thought that it was the parliamentary custom to fire a shot whenever a speaker had finished. The other, who had apparently already listened to several speakers, had got hold of the same idea, but with this variation, that he supposed the shooting to be a sign of appreciation following an especially successful speech.

Thus, the psychic agency which approaches the dream-content with the demand that it must be intelligible which subjects it to a first interpretation, and in doing so leads to the complete misunderstanding of it, is none other than our normal thought. In our interpretation the rule will be, in every case, to disregard the apparent coherence of the dream as being of suspicious origin, and whether the elements are confused or clear, to follow the same regressive path to the dream material.

At the same time we note those factors upon which the above-mentioned (p. 272) scale of quality in dreams—from confusion to clearness—is essentially dependent. Those parts of the dream seem to us clear in which the secondary elaboration has been able to accomplish something; those seem confused where the powers of this performance have failed. Since the confused parts of the dream are often likewise those which are less vividly presented, we may conclude that the secondary dream work is responsible also for a contribution to the plastic intensity of the individual dream structures.

If I seek an object of comparison for the definitive formation of the dream as it manifests itself with the assistance of normal thinking, I can think of none better than those mysterious inscriptions with which *Die Fliegende Blätter* has so long amused its readers. In a certain sentence which, for the sake of contrast, is in dialect, and whose significance is as scurrilous as possible, the reader is led to expect a Latin inscription. For this purpose the letters of the words are taken out of their syllabic groupings and are rearranged. Here and there a genuine Latin word results; at other points we think that letters have been obliterated by weathering or omitted; we allow ourselves to be deluded about the significance of certain isolated and meaningless letters. If we do not wish to be fooled we must give up looking for an inscription, must take the letters as they stand, and combine them, disregarding their arrangement, into words of our mother tongue.

The secondary elaboration is that factor of the dream work which has been observed by most of the writers on dreams, and whose importance has been duly appreciated. Havelock Ellis gives an amusing allegorical description of its performances: "As a matter of fact we might even imagine the sleeping consciousness as saying to itself: 'Here comes our master, Waking Consciousness, who attaches such mighty importance to reason and logic and so forth. Quick! gather things up, put them in

The rest will continue.—ED.

order—any order will do—before he enters to take possession

The identity of this mode of operation with that of waking thought is very clearly stated by Delacroix in his *Sur la structure logique du reve* (p 526) *Cette fonction d interprétation n est pas particulière au reve c est le meme travail de coordination logique que nous faisons sur nos sensations pendant la veille*

J Sully is of the same opinion and so is Tobowolska *Sur ces successions incohérentes d hallucinations l esprit s efforce de faire le meme travail de coordination logique qu il fait pendant le veille sur les sensations Il relie entre elles par un lien imaginaire toutes ces images décousues et bouche les écarts trop grands qui se trouvaient entre elles* (p 93)

Some authors maintain that this ordering and interpreting activity begins even in the dream and is continued in the waking state Thus Paulhan (p 547) *Cependant j ai souvent pensé qu il pouvait y avoir une certain déformation ou plutot reformation du reve dans le souvenir La tendence systématisante de l imagination pourrait fort bien achever après le réveil ce qu elle a ébauché pendant le sommeil De la sorte la rapidité réelle de la pensée serait augmentee en apparence par les perfectionnements dus a l imagination éveillée*

Leroy and Tobowolska (p 592) *Dans le reve au contraire l interprétation et la coordination se font non seulement à l aide des données du reve mais encore à l aide de celles de la veille*

It was therefore inevitable that this one recognized factor of dream formation should be over-estimated so that the whole process of creating the dream was attributed to it This creative work was supposed to be accomplished at the moment of waking as was assumed by Goblot and with deeper conviction by Foucault who attributed to waking thou ht the faculty of creating the dream out of the thoughts which emerged in sleep

In respect to this conception Leroy and Tobowolska express them elves as follows *On a cru pouvoir placer le reve au moment du reveil et ils ont attribué à la pensée de la veille la fonction de construire le reve avec les images présentes dans la pensée du sommeil*

To this estimate of the secondary elaboration I will add the one fresh contribution to the dream work which has been indicated by the sensitive observations of H Silberer Silberer has caught the transformation of thoughts into images *in flagranti* by forcing himself to accomplish intellectual work while in a state of fatigue and somnolence The elaborated thought vanished and in its place there appeared a vision which proved to be a substitute for—usually abstract—thou hts In these experiments it so happened that the emerging image which may be regarded as a dream element represented something other than the thoughts which were waiting for elaboration namely the exhaustion itself the difficulty or distress involved in this work that is the subjective state and the manner of functionin of the person exerting himself rather than the object of his exertions Silberer called this case which in him occurred quite often the *functional phenomenon* in contradistinction to the *material phenomenon* which he expected

For example one afternoon I am lying extremely sleepy on my sofa but I nevertheless force myself to consider a philosophical problem I endeavour to compare the views of Kant and Schopenhauer concerning time Owing to my somnolence I do not succeed in holding on to both trains of thought which would have been necessary for the purposes of comparison After several vain efforts I once more exert all my will power to formulate for myself the Kantian deduction in order to apply it to Schopenhauer s statement of the problem Thereupon I directed my attention to the latter but when I tried to return to Kant I found that he had again escaped me and I tried in vain to fetch him back And now this fruitless endeavour to rediscover the Kantian documents mislaid somewhere in my head suddenly presented itself my eyes being closed as in a

I will now p oceed to summarize this long disquisition on the dream w rk. We w re con fronted by the question whether in dream f rmation th psych exerts all its faculties to their full xtent with ut inhib tion only fractio of them which are estricted in th ir ction. Our in esti-at ons lead us to rej ct ch a statement of the p obl m s wholly inad quate m the ci cumstan es But f in r answer we are t remain o the ground upon whi h the

the process which changes the unconscious thoughts into the dream-content which is pe culiar to the dream life and characteristic of it. Now this peculiar dream work is much farther removed *from* the pattern of waking thought than has been supposed by even the most decided depreciators of the psychic activ ity in dream f rmation. It is not o much that it is more negligent more incorrect more for getful more incomplete than waking thought it is something altogether different qualitative ly from waking thought and cannot therefore be compared with it. It does not think, calcu late or judge at all but limits itself to the work of transformation *It may be exhausti ely* described if we do not lose s ght of the condi tions which its product mu t satisfy This product, the dream has above all to be with drawn from the cen orship and to this end the dream wo k makes use of the *displacement of psychic intensities* even to the transvalua tion of all psychic alues thoughts must be exclusively r predomi antl reproduced in the material of v sual and acou tic memory traces and from this requirement there proceed the *regard of the d e m wo k for representab l ty* which it sati fies by fresh displacements. Greater intens t es have (probably) to be pro- duced than are at the disposal of the n ght dream th ughts and this purpose s served by the exten ive *co densation* to which the co stit ents of the dream thou hts are subjected Little attentio is paid to the logical relations of th thought material they ultimately find

transform tion f these into the dream-co t nt. The dream thoughts perf ctly accurate and are formed with all the psychic p ofus n of whi h we re capabl they bel g t the thought which ha e t become conscio s from whi h ou onsc tho ghts also result by m ans f rtain transpos t on. The e is doubtles m ch in them that is w rth kn wing and also my t rious but th e p bl ms have no particula relation to our dream and can ot claim t be treated under the head f dream-p blems On the other hand we have

pressed whe they are preserved they a e freed from the oncepts and comb ed in

tained the mem ry d the ecees y f i rpre g th dream was ignored. B w when the analysts ha lea become reconciled subs t ting f the manifes dream is m ni as found by interpreta ma y f them re guilty f the mistak to wh ch they dhere jus as tubbornly They look f the es- sence f the dream in this l te co tent, and thereby ve look the dis ction be ween late dream thoughts and the dream wo k. The dream is fundamentally thing m re than *speci l form* f ou thi ki g,

pective tendency f dreams. That the dream should

accordance with their similarity Only one part of the dream work—the revision variable in amount which is effected by the partially wak ened conscious thought—is at all consistent with the conception which the writers on the subject have endeavoured to extend to the whole performance of dream formation

VII THE PSYCHOLOGY OF THE DREAM PROCESSES

AMONG the dreams which have been commu nicated to me by others there is one which is at this point especially worthy of our atten tion It was told me by a female patient who had heard it related in a lecture on dreams Its original source is unknown to me This dream evidently made a deep impression upon the lady since she went so far as to imitate it i e to repeat the elements of this dream in a dream of her own in order by this transference to express her agreement with a certain point in the dream

The preliminary conditions of this typical dream were as follows A father had been watching day and night be ide the sick bed of his child After the child died he retired to rest in an adjoining room but left the door ajar so that he could look from his room into the next where the child s body lay surrounded by tall candles An old man who had been installed as a watcher sat beside the body murmuring prayers After sleeping for a few hours the father dreamed that *the child was standing by his bed clasping his arm and cry ing reproachfully Father don t you see that I am burning?* The father woke up and no ticed a bright light coming from the adjoining room Rushing in he found that the old man had fallen asleep and the sheets and one arm of the beloved body were burnt by a fallen candle

The m

enou

turer

potted it was correct The bright light shining through the open door on to the sleeper s eyes gave him the impres sion which he would have received had he been awake namely that a fire had been started near the corpse by a falling candle It is quite possible that he had taken into his sleep his anxiety lest the aged watcher should not be equal to his ta k

We can find nothing to change in this in terpretation we can only add that the content of the dream must be overdetermined and that the peech of the child must have con sisted of phrases which it had uttered while still alive and which were associated with im portant events for the father Perhaps the complaint *I am burning* was associated with the fever from which the child died and *Fa ther don t you see?* to some other affective occurrence unknown to us

Now when we have come to recognize that the dream has meaning and can be fitted into the context of psychic events it may be surprising that a dream should have occurred in circum stances which called for such an immediate waking We shall then note that even this dream is not lacking in a wish fulfilment The dead child behaves as though alive he warns his father himself he comes to his father s bed and clasps his arm as he probably did in the recollection from which the dream obtained the first part of the child s speech It was for the sake of this wish fulfilment that the father slept a moment longer The dream was given precedence over waking reflection because it was able to show the child still living If the father had waked first and had then drawn the conclusion which led him into the adjoin ing room he would have shortened the child s life by this one moment

There can be no doubt about the peculiar features in this brief dream which engage our particular interest So far we have endeav oured mainly to ascertain wherein the secret meaning of the dream consists how it is to be discovered and what means the dream work uses to conceal it In other words our greatest interest has hitherto been centered on the problems of interpretation Now however we encounter a dream which is easily explained and the meaning of which is without disguise we note that nevertheless this dream preserves the essential characteristics which conspicuous ly differentiate a dream from our waking thoughts and this difference demands an ex planation It is only when we have disposed of all the problems of interpretation that we feel how incomplete is our psychology of dreams

But before we turn our attention to this new path of investigation let us stop and look back and consider whether we have not overlooked something important on our way hither For we must understand that the easy and com fortable part of our journey lies behind us Hitherto all the paths that we have followed have led if I mistake not, to l ght to explana tion and to full understanding but from the moment when we seek to penetrate more deep-

t th psychic proce ses in dream ng all

edge to whi h we can eter suc exp ... y fundame tals as may be inferr d from the psy ch logical invest gation of dreams On the co trary w shall be compelled to ad ance a number of new assumpti ns which do l ttle more than co j cture th struct re of the psy chi apparatus and the play of the e e gies active in it a d we hall ha e to be careful not to go too far beyo d the s mplest logical constru tion si c th rw e ts value will be doubtful And e en if we should be unerr g in our infere ces and take c gn zan e of all the l gical po s bilit s we should st ll be in danger of arri g at a c mplet ly mi taken result wing to the probabl incompl teness of the p liminary stat ment of o r elementary data. vixit I found as an insignificant interpolation that I had at first overlooked the sentence *As P does not understand him Fl asks me* etc The interpretation then coming to a stand still I went back to these words and I found through them the way to the infantile phantasy which appeared in the dream thoughts as an intermediate point of junction This came about by means of the poet s verses

Selten habt ihr mich verstanden
Selten auch verstand ich Euch
Nur wenn wir im Kot *uns fanden*
So verstanden wir uns gleich!

Every analysis will afford evidence of the fact that the most insignificant features of the dream are indispensable to interpretation and will show how the completion of the task is delayed if we postpone our examination of them We have given equal attention in the interpretation of dreams to every nuance of verbal expression found in them indeed when ever we are confronted by a senseless or in sufficient wording as though we had failed to translate the dream into the proper version we have respected even these defects of expres sion In brief what other writers have re arded as arbitrary improvisations concocted hastily to avoid confusion we have treated like a sacred text This contradiction calls for ex planation

It would appear without doing any injustice to the writers in question that the explana tion is in our favour From the standpoint of our newly acquired insight into the origin of dreams all contradictions are completely reconciled It is true that we distort the dream in our attempt to reproduce it we once more find therein what we have called the secondary and often misunderstanding elaboration of the dream by the agency of normal thinking But this distortion is itself no more than a part of the elaboration to which the dream thoughts are constantly subjected as a result of the dream censorship Other writers have here sus pected or observed that part of the dream distortion whose work is manifest but for us this is of little consequence as we know that a far more extensive work of distortion not so easily apprehended has already taken the dream for its object from among the hidden dream thoughts The only mistake of these writers consists in believing the modification effected in the dream by its recollection and verbal expression to be arbitrary incapable of further solution and consequently liable to lead us astray in our cognition of the dream. They underestimate the determination of the dream in the psyche Here there is noth g arbitrary It can be shown that in all ca es a second train of thought immediately takes over the determination of the elements wh ch have been left undetermined by the first For example I wish quite arbitrarily to think of a number but this is not possible the number that occurs to me is definitely and neces arily determined by thou hts within me which may be quite foreign to my momentary purpo e The modifications which the dream undergoes in its revision by the waking mind are ju t as little arbitrary They preserve an associative connection with the content whose place they take and serve to show us the way to this content which may itself be a substitute for yet another content

In analysing the dreams of patients I im pose the following test of this assertion and never without success If the first report of a dream seems not very comprehensible I re quest the dreamer to repeat it This he rarely does in the same words But the passages in which the expression is modified are thereby made known to me as the weak points of the dream s disguise they are what the embroi dered emblem on Siegfried s raiment was to Hagen These are the points from which the analysis may start The narrator has been ad moni hed by my announcement that I intend to take special pains to solve the dream and immediately obedient to the urge of resistance he protects the weak points of the dream s disguise replacing a treacherous expression by a less relevant one He thus calls my attention to the expressions which he has discarded. From the efforts made to guard against the solution of the dream I can also draw conclu sions about the care with which the raiment of the dream has been woven

The writers whom I have mentioned are however less justified when they attribute o much importance to the doubt with which our jud ment approaches the relation of the dream. For this doubt is not intellectually warranted our memory can give no guarantees but never theless we are compelled to credit its state ments far more frequently than is objectively justifiable Doubt concerning the ac urate re production of the dream or of individual

dust of the dream, is only another offshoot of the dream-censorship that is of resistance to the emergence of the dream thoughts into consciousness. This resistance has not yet exhausted itself by the displacements and substitutions which it has effected so that it still clings in the form of doubt, to what has been allowed to emerge. We can recognize this doubt all the more readily in that it is careful never to attack the intensive elements of the dream, but only the weak and indistinct ones. But we already know that a transvaluation of all the psychic values has taken place between the dream thoughts and the dream. The distortion has been made possible only by devaluation; it constantly manifests itself in this way and sometimes contents itself therewith. If doubt is added to the indistinctness of an element of the dream-content we may, following the indication, recognize in this element a direct offshoot of one of the outlawed dream thoughts. The state of affairs is like that obtaining after a great revolution in one of the republics of antiquity or the Renaissance. The once powerful, ruling families of the nobility are now banished, all high posts are filled by upstarts; in the city itself only the poorer and most powerless citizens or the remoter followers of the vanquished party are tolerated. Even the latter do not enjoy the full rights of citizenship. They are watched with suspicion. In our case instead of suspicion we have doubt. I must insist, therefore, that in the analysis of a dream one must emancipate oneself from the whole scale of standards of reliability and if there is the slightest possibility that this or that may have occurred in the dream, it should be treated as an absolute certainty. Until one has decided to reject all respect for appearances in tracing the dream elements the analysis will remain at a standstill. Disregard of the element concerned has the psychic effect, in the person analysed, that nothing in connection with the unwished ideas behind this element will occur to him. This effect is really not self-evident. It would be quite reasonable to say: Whether this or that was contained in the dream I do not know for certain, but the following ideas happen to occur to me. But no one ever does say so. It is precisely the disturbing effect of doubt in the analysis that permits it to be unmasked as an offshoot and instrument of the psychic resistance. Psycho-analysis is justifiably suspicious. One of its rules runs: Whatever disturbs the progress of the work is a resistance.

The forgetting of dreams too remains inexplicable until we seek to explain it by the power of the psychic censorship. The feeling that one has dreamed a great deal during the night and has retained only a little of it may have yet another meaning in a number of cases; it may perhaps mean that the dream work has continued in a perceptible manner throughout the night, but has left behind it only one brief dream. There is however no possible doubt that a dream is progressively forgotten on waking. One often forgets it in spite of a painful effort to recover it. I believe however that just as one generally overestimates the extent of this forgetting so also one overestimates the lacunae in our knowledge of the dream due to the gaps occurring in it. All the dream-content that has been lost by forgetting can often be recovered by analysis; in a number of cases at all events, it is possible to discover from a single remaining fragment, not the dream of course—which, after all is of no importance—but the whole of the dream thoughts. It requires a greater expenditure of attention and self suppression in the analysis, that is all, but it shows that the forgetting of the dream is not innocent of hostile intention.

A convincing proof of the tendencious nature of dream forgetting—of the fact that it serves the resistance—is obtained on analysis by investigating a preliminary stage of forgetting. It often happens that, in the midst of an interpretation, an omitted fragment of the dream suddenly emerges which is described as having been previously forgotten. This part of the dream that has been wrested from forgetfulness is always the most important part. It lies on the shortest path to the solution of

This peremptory statement, "Whatever disturbs the progress of the work is a resistance" might easily be misunderstood. It has, of course, the significance merely of a technical rule, a warning for the analyst. It is not denied that during an analysis events may occur which cannot be ascribed to the intention of the person analysed. The patient's father may die in other ways than by being murdered by the patient, [illegible]

the dream and for that very reason it was most exposed to the resistance Among the examples of dreams that I have included in the text of this treatise it once happened that I had subsequently to interpolate a fragment of dream content The dream is a dream of travel which revenges it elf on two unamiable travelling companions I have left it almost entirely uninterpreted as part of its content is crudely obscene The part omitted reads *I said referring to a book of Schiller's It is from but corrected myself as I reali ed my mistake It is by Whereupon the man remarked to his sister Yes he said it correctly*

Self correction in dreams which to some writers seems so wonderful does not really call for consideration But I will draw from my own memory an instance typical of verbal errors in dreams I was nineteen years of age when I visited England for the first time and I spent a day on the shore of the Irish Sea Naturally enough I amused myself by picking up the marine animals left on the beach by the tide and I was just examining a starfish (the dream begins with *Hollthurn—Holothurian*) when a pretty little girl came up to me and asked me *Is it a starfish? Is it alive?* I replied *Yes he is alive* but then felt ashamed of my mistake and repeated the sentence correctly For the grammatical mistake which I then made the dream substitutes another which is quite common among German people *Das Buch ist von Schiller'* is not to be translated by *the book is from* but by *the book is by* That the dream work accomplishes this substitution because the word *from* owing to its consonance with the German adjective *fromm* (pious devout) makes a remarkable condensation possible should no longer surprise us after all that we have heard of the intentions of the dream work and its unscrupulous selection of means But what relation has this harmless recollection of the seashore to my dream? It explains by means of a very innocent example that I have used the word—the word denoting gender or *sex* or the *sexual* (*He*)—in the wrong place This is surely one of the keys to the solution of the dream Those who have heard of the derivation of the book title *Matter and Motion* (Molière in *Le Malade Imaginaire La Matière est-elle laudable?—A Motion of the bowels*) will readily be able to supply the missin parts

Moreover I can prove conclusively by a *demonstratio ad oculos* that the forgetting of the dream is in a large measure the work of the resistance A patient tells me that he has dreamed but that the dream has vanished without leaving a trace as if nothing had happened We set to work however I come upon a resistance which I explain to the patient encoura ing and urgin him I help him to become reconciled to some disagreeable thought and I have hardly succeeded in doing so when he exclaims Now I can recall what I dreamed! The same resistance which that day disturbed him in the work of interpretation caused him also to forget the dream By overcoming this resistance I have brought back the dream to his memory

In the same way the patient having reached a certain part of the work may recall a dream which occurred three four or more days ago and which has hitherto remained in oblivion

Psycho analytical experience has furnished us with yet another proof of the fact that the forgetting of dreams depends far more on the resistance than on the mutually alien character of the waking and sleeping states as some writers have believed it to depend It often happens to me as well as to other analysts and to patients under treatment that we are waked from sleep by a dream as we say and that immediately thereafter while in full possession of our mental faculties we begin to interpret the dream Often in such cases I have not rested until I have achieved a full understanding of the dream and yet it has happened that after waking I have forgotten the interpretation work as completely as I have forgotten the dream content itself though I have been aware that I have dreamed and that I had interpreted the dream The dream has far more frequently taken the result of the interpretation with it into forgetfulness than the intellectual faculty has succeeded in retaining the dream in the memory But between this work of interpretation and the waking thoughts there is not that psychic abyss by which other writers have sought to explain the forgetting of dreams When Morton Prince objects to my explanation of the forgettin of dreams on

of a complete interpretation of the dream which is both ingenious and coherent and which gives particulars of all the elements of the dream content Besides this another interpretation an over interpretation of the same dream one which has escaped him may be possible It is really not easy to form an idea of the wealth of trains of unconscious thought striving for expression in our minds or to credit the adroitness displayed by the dream work in killing—so to speak—seven flies at one stroke like the journeyman tailor in the fairy tale by means of its ambiguous modes of expression The reader will constantly be inclined to reproach the author for a superfluous display of ingenuity but anyone who has had personal experience of dream interpretation will know better than to do so

On the other hand I cannot accept the opinion first expressed by H Silberer that every dream—or even that many dreams and certain groups of dreams—calls for two different interpretations between which there is even supposed to be a fixed relation One of these which Silberer calls the *psycho-analytic* interpretation attributes to the dream any meaning you please but in the main an infantile sexual one The other the more important interpretation which he calls the *anagogic* interpretation reveals the more serious and often profound thoughts which the dream work has used as its material Silberer does not prove this assertion by citing a number of dreams which he has analysed in these two directions I am obliged to object to this opinion on the ground that it is contrary to facts The majority of dreams require no over interpretation and are especially insusceptible of an anagogic interpretation The influence of a tendency which seeks to veil the fundamental conditions of dream formation and divert our interest from its instinctual roots is as evident in Silberer s theory as in other theoretical efforts of the last few years In a number of cases I can confirm Silberer s assertions but in these the analysis shows me that the dream work was confronted with the task of transforming a series of highly abstract thoughts incapable of direct representation from waking life into a dream The dream work attempted to accomplish this task by seizing upon another thou ht mat [illegible]
allegori [illegible]
thereby [illegible]
them T [illegible] interpretation of a dream originating in this manner will be given by the dreamer immediately but the correct interpretation of the substituted material can be obtained only by means of the familiar technique

The question whether every dream can be interpreted is to be answered in the negative One should not forget that in the work of interpretation one is opposed by the psychic forces that are responsible for the distortion of the dream Whether one can master the inner resistances by one s intellectual interest one s capacity for self control one s psychological knowledge and one s experience in dream interpretation depends on the relative strength of the opposing forces It is always possible to make some progress one can at all events go far enough to become convinced that a dream has meaning and generally far enough to gain some idea of its meaning It very often happens that a second dream enables us to confirm and continue the interpretation assumed for the first A whole series of dreams continuing for weeks or months may have a common basis and should therefore be interpreted as a continuity In dreams that follow one another we often observe that one dream takes as its central point something that is only alluded to in the periphery of the next dream and conversely so that even in their interpretations the two supplement each other That different dreams of the same night are always to be treated in the work of interpretation as a whole I have already shown by examples

In the best interpreted dreams we often have to leave one passage in obscurity because we observe during the interpretation that we have here a tangle of dream thoughts which cannot be unravelled and which furnishes no fresh contribution to the dream content This then, is the keystone of the dream the point at which it ascends into the unknown For the dream thoughts which we encounter during the interpretation commonly have no termination but run in all directions into the net like entanglement of our intellectual world It is from some denser part of this fabric that the dream wi h then arises like the mushroom from its mycelium

Let us now return to the facts of dream forgetting So far of course we have failed to draw any important conclusion from them When our waking life shows an unmistakable intention to forget the dream which has been formed during the night either as a whole immediately after waking or little by little

in the course of the day, and when we recognize as the chief factor in this process of forgetting the psychic resistance against the dream which has already done its best to oppose the dream at night, the question then arises: What actually has made the dream-formation possible against this resistance? Let us consider the most striking case in which the waking life has thrust the dream aside as though it had never happened. If we take into consideration the play of the psychic forces, we are compelled to assert that the dream would never have come into existence had the resistance prevailed at night as it did by day. We conclude, then, that the resistance loses some part of its force during the night; we know that it has not been discontinued, as we have demonstrated its share in the formation of dreams—namely, the work of distortion. We have therefore to consider the possibility that at night the resistance is merely diminished, and that dream-formation becomes possible because of this slackening of the resistance; and we shall readily understand that, as it regains its full power on waking, it immediately thrusts aside what it was forced to admit while it was feeble. Descriptive psychology teaches us that the chief determinant of dream-formation is the dormant state of the psyche, and we may now add the following explanation: *The state of sleep makes dream-formation possible by reducing the endopsychic censorship.*

We are certainly tempted to look upon this as the only possible conclusion to be drawn from the facts of dream-forgetting, and to develop from this conclusion further deductions as to the comparative energy operative in the sleeping and waking states. But we shall stop here for the present. When we have penetrated a little farther into the psychology of dreams we shall find that the origin of dream-formation may be differently conceived. The resistance which tends to prevent the dream-thoughts from becoming conscious may perhaps be evaded without suffering reduction. It is also plausible that both the factors which favour dream-formation, the reduction as well as the evasion of the resistance, may be simultaneously made possible by the sleeping state. But we shall pause here, and resume the subject a little later.

We must now consider another series of objections against our procedure in dream-interpretation. For we proceed by *dropping* all the directing ideas which at other times control reflection, directing our attention to a single element of the dream, noting the involuntary thoughts that associate themselves with this element. We then take up the next component of the dream-content, and repeat the operation with this, and, regardless of the direction taken by the thoughts, we allow ourselves to be led onwards by them, rambling from one subject to another. At the same time we harbour the confident hope that we may in the end, and without intervention on our part, come upon the dream-thoughts from which the dream originated. To this the critic may make the following objection: That we arrive somewhere if we start from a single element of the dream is not remarkable. Something can be associatively connected with every idea. The only thing that is remarkable is that one should succeed in hitting upon the dream-thoughts in this arbitrary and aimless excursion. It is probably a self-deception; the investigator follows the chain of associations from the one element which is taken up until he finds the chain breaking off, whereupon he takes up a second element; it is thus only natural that the originally unconfined associations should now become narrowed down. He has the former chain of associations still in mind, and will

with the associations of the first chain. He then *imagines that he has found a thought which* represents a point of junction between two of the dream-elements. As he allows himself all possible freedom of thought-connection, except only the transitions from one idea to another which occur in normal thinking, it is not difficult for him finally to concoct out of a series of *intermediary thoughts* something which he calls the dream-thoughts, and without any guarantee, since they are otherwise unknown, he palms these off as the psychic equivalent of the dream. But all this is a purely arbitrary procedure, an ingenious-looking exploitation of chance, and anyone who will go to this useless trouble can in this way work out any desired interpretation for any dream whatever.

If such objections are really advanced against us, we may in defence refer to the impression produced by our dream-interpretations, the surprising connections with other dream-elements which appear while we are following up the individual ideas, and the improbability that anything which so perfectly covers and

explains the dream as do our dream interpretations could be achieved otherwise than by following previously established psychic connections We might also point to the fact that the procedure in dream interpretation is identical with the procedure followed in the resolution of hysterical symptoms where the correctness of the method is attested by the emergence and disappearance of the symptoms —that is where the interpretation of the text is confirmed by the interpolated illustrations But we have no reason to avoid this problem—namely how one can arrive at a pre existent aim by following an arbitrarily and aimlessly maundering chain of thoughts—since we shall be able not to solve the problem it is true but to get rid of it entirely

For it is demonstrably incorrect to state that we abandon ourselves to an aimless excursion of thought when as in the interpretation of dreams we renounce reflection and allow the involuntary ideas to come to the surface It can be shown that we are able to reject only those directing ideas which are known to us and that with the cessation of these the unknown—or as we inexactly say unconscious—directing ideas immediately exert their influence and henceforth determine the flow of the involuntary ideas Thinking without directing ideas cannot be ensured by any influence we ourselves exert on our own psychic life neither do I know of any state of psychic derangement in which such a mode of thought establishes itself The psychiatrists have here far too prematurely relinquished the idea of the solidity of the psychic structure I know that an unregulated stream of thoughts devoid of directing ideas can occur as little in the realm of hysteria and paranoia as in the formation or solution of dreams Perhaps it does not occur at all in the endogenous psychic affections and according to the ingenious hypothesis of Lauret even the deliria observed in confused psychic states have meaning and are incomprehensible to us only because of omissions I have had the same conviction whenever I have had an opportunity of observing such states The deliria are the work of a censorship which no longer makes any effort to conceal its sway which instead of lending its support to a revision that is no longer obnoxious to it cancels regardlessly anything to which it objects thus causing the remnant to appear disconnected This censorship proceeds like the Russian censorship on the frontier which allows only those foreign journals which have had certain passages blacked out to fall into the hands of the readers to be protected

The free play of ideas following any chain of associations may perhaps occur in cases of destructive organic affections of the brain What however is taken to be such in the psychoneuroses may always be explained as the influence of the censorship on a series of thoughts which have been pushed into the foreground by the concealed directing ideas It has been considered an unmistakable sign of free association unencumbered by directing ideas if the emerging ideas (or images) appear to be connected by means of the so-called superficial associations—that is by assonance verbal ambiguity and temporal coincidence without inner relationship of meaning in other words if they are connected by all those a so-

Only recently has my attention been called to the fact that Ed. v. Hartmann ... [illegible]

ciations which we allow oursel es to explo t in w t and in playing upon words This dis-tinguishing ma k h lds good with a ociations which lead us from the elements of the dream co ent to th intermediary thoughts, and from these t the dream-though s proper in many analyses of dreams w ha e found ur pri ing examples of this. In these no connection was too loose and o witticism too objectio ble to serve as a bridg from one thought to an t e B th correct understanding of such surpris g t lerance is not f r to seek. *When ever on psych lement s corrected with an ther by an ob x ous and superficial associ at o th e exists als a correct and more pr found connection between the two wh ch s c mb to the esist ce of the censorsh p*

The orrect explanation f r the predomi nance of the superficial a sociations is the pressure of the censorship and n t the sup-pressio f the di ecting idea Whe ever th censorship re d rs th ormal conn ctive paths impassabl the uperficial associations will re place the deeper ones in the represent tion It is as though *n mounta ous region a general* m erruption f traffic, fo example an inunda t n, should rend r the broad highways impass-able traffic would the ha e to be maintained by teep and inco enient tracks used at other times nly by the hunter

We can here di ti guish two cases which however are essentially In th first case th sorship is dire ted nly again t the con ection f two th ughts which, bein d tached from anoth r escape ts o pos t on. The tw th ught th enter successi ely into con sc ousness their onnection remains concealed but in ts p ace th re occurs to us a uperficial c nnection between the two which ld ot therwise ha e occurred to us and which as a rule onnects with another an le of the con ceptual complex instead f that f om w ch the suppressed but essential conn ction pro-ceeds Or in th seco d case both th ughts owing to thei content, succumb t the c nso ship both then appear not in th orrect form but in modified ubst uted f rm and both substit ted th ughts re so selected as to represent, by a superficial sociat o the essential relation which xi ted between those that they ha e epla ed. *Unde th pre sur f th cen or h p the displ ment f ormal nd ri al ass ciation by one s perficial and ap-parently absurd has thus curr d in both ses*

Because w kn w f these displacem ts we unhesitatingly rely upon even the superficial associations which occur in the course of dream interpretati n

The psycho-analys s of neurotics makes abundant use of the two principles that with the abandonment of the conscious directin ideas the control o er the flow of ideas is transferred to the concealed directing ideas and that superficial a sociations are o ly a displacement substitute for suppres ed and m re profound ones Indeed, psycho-analysis makes these two principles the found tio stones of its techniqu When I request a

able to drop the directin idea of the treat ment and I feel justfied n concluding that what he reports even thou h it may seem to be quite ingenuous and arb trary has ome connect on w th his mo bid state An ther di ecting idea of which the pat ent has no us p n is my own personal ty The full appreci ation as well as the deta led proof of both these explanations belo gs to the description *of th psycho-analytic technique as a therapeu* tic m thod We ha e here reached o e of the junct ns so to peak, at which we purposely dr p the bject of dream interpretation.

Of all th object ns ra sed only one is just fi d and st ll remains to be m t namely that we ought t t a ribe all the associations of the interp t tio wo k to the nocturnal dream work. By int rpretat on in the wakin state we are ctually pennin a path running back fr m th dream-elem nts to the dream thought The dream wo k has follow d the contrary direction, and it is not t all probable that these paths are equally passable in opposite directions. On the contrary it appe rs that during the day by means of n w thought-con nections we sink shafts that strike the inte med ary tho ghts and the dream thoughts now in this pla e, now in that We can see how the recent th ught mat rial of the day f ces its way into the interpretation series and how th

Th sam considerations na rally hold good f th

additional resistance which has appeared since the night probably compels it to make new and further detours But the number and form of the collaterals which we thus contrive during the day are psychologically speaking indifferent so long as they point the way to the dream thoughts which we are seeking

B *Regression*

Now that we have defended ourselves against the objections raised or have at least indicated our weapons of defence we must no longer delay entering upon the psychological investigations for which we have so long been preparing Let us summarize the main results of our recent investigations The dream is a psychic act full of import its motive power is invariably a wish craving fulfilment the fact that it is unrecognizable as a wish and its many peculiarities and absurdities are due to the influence of the psychic censorship to which it has been subjected during its formation Besides the necessity of evading the censorship the following factors have played a part in its formation first a need for condensing the psychic material second regard for representability in sensory images and th

...udates and assumptions Thus the reciprocal relation of the wish motives and the four conditions as well as the mutual relations of these conditions must now be investigated the dream must be inserted in the context of the psychic life

At the beginning of this section we cited a certain dream in order that it might remind us of the problems that are still unsolved The interpretation of this dream (of the burning child) presented no difficulties although in the analytical sense it was not given in full We asked ourselves why after all it was necessary that the father should dream instead of waking and we recognized the wish to represent the child as living as a motive of the dream That there was yet another wish operative in the dream we shall be able to show after further discussion For the present however we may say that for the sake of the wish fulfilment the thought process of sleep was transformed into a dream

If the wish fulfilment is cancelled out only one characteristic remains which distinguishes the two kinds of psychic events The dream thought would have been I see a glimmer coming from the room in which the body is lying Perhaps a candle has fallen over and the child is burning! The dream reproduces the result of this reflection unchanged but represents it in a situation which exists in the present and is perceptible by the senses like an experience of the waking state This however is the most common and the most striking psychological characteristic of the dream a thought usually the one wished for is objectified in the dream and represented as a scene or—as we think—experienced

But how are we now to explain this characteristic peculiarity of the dream work or—to put it more modestly—how are we to bring it into relation with the psychic processes?

On clo...

by...

...are almost independent of each other One is its representation as a present situation with the omission of *perhaps* the other is the translation of the thought into visual images and speech

The transformation to which the dream thoughts are subjected because the expectation is put into the present tense is perhaps in this particular dream not so very strikin This is probably due to the special and really subsidiary role of the wish fulfilment in this dream Let us take another dream in which the dream wish does not break away from the continuation of the waking thoughts in sleep for example the dream of Irma s injection Here the dream thought achievin representation is in the conditional If only Otto could be blamed for Irma s illness! The dream suppresses the conditional and replaces it by a simple present tense Yes Otto is to blame for Irma s illness This then is the first of the transformations which even the undistorted dream imposes on the dream thoughts But we will not linger over this first peculiarity of the dream We dispose of it by a reference to the conscious phantasy the day dream which behaves in a similar fashion with its conceptual content When Daudet s M Joyeuse wanders unemployed throu h the streets of Paris while his daughter is led to believe that he has a post and is sitting in his office he dreams in the present ten e of circumstances that might help him to obtain a recommendation and employment The dream then employs the pre ent tense in the same manner and with the same right as the day dream The present is the tense in which the wish is represented as fulfilled

The second quality peculiar to the dream alone, as distinguished from the day-dream, is that the conceptual content is not thought, but is transformed into visual images to which we give credence and which we believe that we experience. Let us add, however, that not all dreams show this transformation of ideas into visual images. There are dreams which consist solely of thoughts but we cannot on that account deny that they are substantially dreams. My dream *Autodidasker—the day fantasy with Professor N.* is of this character: it is almost as free of visual elements as though I had thought its content during the day. Moreover every long dream contains elements which have not undergone this transformation into the visual, and which are simply thought or known as we are wont to think or know in our waking state. And we must here reflect that this transformation of ideas into visual images does not occur in dreams alone but also in hallucinations and visions, which may appear spontaneously in health, or as symptoms in the psychoneuroses. In brief the relation which we are here investigating is by no means an exclusive one: the fact remains however that this characteristic of the dream, wherever it occurs, seems to be its most noteworthy characteristic, so that we cannot think of the dream-life without it. To understand it, however requires a very exhaustive discussion.

Among all the observations relating to the theory of dreams to be found in the literature of the subject, I should like to lay stress upon one as being particularly worthy of mention. The famous G. T. H. Fechner makes the conjecture in a discussion as to the nature of the dream *that the scene of action of dreams is set up elsewhere than in the waking ideation*. No other assumption enables us to comprehend the special peculiarities of the dream-life.

The idea which is thus put before us is one of *psychic locality*. We shall wholly ignore the fact that the psychic apparatus concerned is known to us also as an anatomical preparation, and we shall carefully avoid the temptation to determine the psychic locality in any anatomical sense. We shall remain on psychological ground, and we shall do no more than accept the invitation to think of the instrument which serves the psychic activities much as we think of a compound microscope, a photographic camera, or other apparatus. The psychic locality, then, corresponds to a place within such an apparatus in which one of the preliminary phases of the image comes into existence. As is well known, there are in the microscope and the telescope such ideal localities or planes in which no tangible portion of the apparatus is located. I think it superfluous to apologize for the imperfections of this and all similar figures. These comparisons are designed only to assist us in our attempt to make intelligible the complication of the psychic performance by dissecting it and referring the individual performances to the individual components of the apparatus. So far as I am aware no attempt has yet been made to divine the construction of the psychic instrument by means of such dissection. I see no harm in such an attempt. I think that we should give free rein to our conjectures provided we keep our heads and do not mistake the scaffolding for the building. Since for the first approach to any unknown subject we need the help only of auxiliary ideas, we shall prefer the crudest and most tangible

... others ...

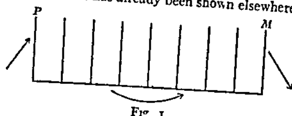
the sake of clearness *systems*. We shall then anticipate that these systems may perhaps maintain a constant spatial orientation to one another very much as do the different and successive systems of lenses of a telescope. Strictly speaking there is no need to assume an actual spatial arrangement of the psychic system. It will be enough for our purpose if a definite sequence is established, so that in certain psychic events the system will be traversed by the excitation in a definite temporal order. This order may be different in the case of other processes; such a possibility is left open. For the sake of brevity we shall hence forth speak of the component parts of the apparatus as *ψ-systems*.

The first thing that strikes us is the fact that the apparatus composed of ψ-systems has a direction. All our psychic activities proceed from (inner or outer) stimuli and terminate in innervations. We thus ascribe to the apparatus a sensory and a motor end; at the sensory end we find a system which receives the perceptions, and at the motor end another which opens the sluices of motility. The psychic process generally runs from the perceptive end to the motor end. The most general scheme of the psychic apparatus has therefore the following appearance as shown in Fig. 1 on page 352. But this is only in compliance with the requirement, long familiar to us, that the psychic apparatus

Psychophysik, Part II, p. 520.

must be constructed like a reflex apparatus The reflex act remains the type of every psychic activity as well

We now have reason to admit a first differentiation at the sensory end The percepts that come to us leave in our psychic apparatus a trace which we may call a *memory trace* The function related to this memory trace we call *the memory* If we hold seriously to our resolution to connect the psychic processes into systems the memory trace can consist only of lasting changes in the elements of the systems But as has already been shown elsewhere



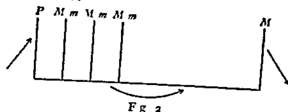


Fig 1

obvious difficulties arise when one and the same system is faithfully to preserve changes in its elements and still to remain fresh and receptive in respect of new occasions of change In accordance with the principle which is directing our attempt we shall therefore ascribe these two functions to two different systems We assume that an initial system of this apparatus receives the stimuli of perception but retains nothing of them — that is it has no memory and that behind this there lies a second system which transforms the momentary excitation of the first into lasting traces The following would then be the diagram of our psychic apparatus

Fg 2

We know that of the percepts which act upon the *P* system we retain permanently something else as well as the content itself Our percepts prove also to be connected with one another in the memory and this is especially o if they originally occurred simultaneously We call this the fact of *association* It is now clear that if the *P* system is entirely lacking in memory it certainly cannot preserve traces for the associations the individual *P*-elements would be intolerably hindered in their functioning if a residue of a former connection should make its influence felt a ainst a new perception Hence we must rather assume that the memory system is the basis of association The fact of association then consists in this— that in consequence of a lessening of resistance a d a smoothing of the ways from one of the *mem* elements the excitation transmits itself to a second rather than to a third *mem*-element.

On further investigation we find it necessary to assume not one but many such *mem* systems in which the same excitation transmitted by the *P*-elements undergoes a diversified fixation The first of these *mem* systems will in any ca e contain the fixation of the association through simultaneity while in those lying farther away the same material of excitation will be arranged according to other forms of combination so that relation hips of similarity etc might perhaps be represented by these later systems It would of course be idle to attempt to express in words the psychic significance of such a system Its characteristic would lie in the intimacy of its relations to elements of raw material of memory—that is (if we wish to hint at a more comprehensive theory) in the gradations of the conductive resistance on the way to these elements

An observation of a general nature which may possibly point to something of importance may here be interpolated The *P* system which possesses no capacity for preserving changes and hence no memory furnishes to consciousness the complexity and variety of the sensory qualities Our memories on the other hand are unconscious in themselves those that are most deeply impressed form no exception They can be made conscious but there is no doubt that they unfold all their activities in the unconscious state What we term our character is ba ed indeed on the memory traces of our impressions and it is precisely those impressions that have affected us most strongly tho e of our early youth which hardly ever become conscious But when memories become conscious again they show no sensory quality or a very ne ligible one in comparison with the perceptions If now it can be confirmed *that for consciousness memory and quality are mutually exclusive in the ψ systems* we have gained a most promising insight into the determinations of the neuron excitations

What we have so far assumed concerning the composition of the psychic apparatus at

S w it g th I ha th ght th t co sci nes oc t ally th l l ty f the m m ry t ce (Cf \ t *be de li d blo k* 9 5 *Ges Sch ft* \ L i)

the sens'b'e end has been assumed regardless of dreams and of the psychological explanations which we have hitherto deri ed from them Dreams h wever w ll erv as a s u ce of ev dence f ou knowledge f an ther part of the apparatus We ha e seen that it was impos ible to explain dream formation unless we ventur d to a sume two psychic *ins ances* on of which subjected the activities of the other to criti cism the result of which was exclusion from co sciousness.

We have concluded that the criticizing *in-sta e* maintains closer relati ns with the con-sciou ness than the *inst ce* criticized It stands between the latt r and th consciousness like a screen. Furth we ha e f und that the e is reaso to identify th riti izing *instance* with th t which directs our waking life and deter min s our voluntary conscious activitie If in acc rdance with our a sumptions we now re pla e these *nstan es* by systems the criticiz ing system will th refo e be moved to the mo-to d. We ow enter both systems in our di agram, exp es in by the names given them thei relation to c ciousness

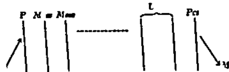

Fig 3

The last f the syst ms at the motor e d we call the *preconscio (Pcs)* to de te that the exciti g processes in thi sy tem can re ch con sciousness w tho t any furthe d tention, pro-ded ertain other condition are fulfilled e.g th attainment of a d finite degree of intens ty ertain pportionment f that functi which must all ttenti n, tc This is at the same tim the system which h lds the keys f vol untary m tility The system behind t we call the *unconscious (Ucs)* because it has no a ess to ons ne s *except th ough th pr con scious* in th pas ge thr gh which the e ci tation-p ocess m t submit to certain changes

I hich f these syst ms then do we lo-calize the impetus t dream f rmation? F r th sak f mplicity l t u say in the ystem *Ucs* W shall fi d t is true in subsequ nt di cus ons, that this is not alt gether orrect

that dream formation is obliged to make con nect on w th dream thoughts which belong to the system of the preconscious. But we shall learn elsewhere when we come to deal with the dream wish that the motive power of the dream is furnished by the *Ucs* and on account of this factor we shall a sume the unconscious system as the tarting poi t for dream forma t o This dream-e citation l ke all the other thought structures will now stri e to continue itself in the *Pcs* and thence to gain admis ion to the consciousness

Experience teaches us that the path lead ng through the preconsc ous to consciousness is cl sed to the dream thoughts during the day by

this admission were rendered possible to the dream th ughts by the weaken ng during the night of the resista ce watching n the bound ary between the unconscious and the precon sci us, we should then ha e dreams in the mat rial of our deas which would not display the hallucinatory character that interests us at present.

Th weakening of the censorship between the two systems *Ucs* a d *Pcs* can explain to us only su h dreams as the *A todidasker* dream but n t dreams like that of the burn ng child whi h—as will be remembe ed—we tated as a p oblem at the outset in our present inves tigations

Wh t takes place n th hallucinatory d eam we can describe no ther way than by say ing that the excitation foll w a retrogres e co se It communicates it elf not to the m tor e d of the apparatus but to the sen ory end and finally rea hes the system of pe cept on. If we call the direct on which the ps chic pro-ce s foll ws f om the unco scious to the waking tate *progressive* we may then speak of th d am as ha ing *eg essi e* character

This *egres on* th efore ssu edly one of the mo t mporta t psycholog al peculi rit es f th d eam process but we must n t forget that t is n t characteri tic of the dream alo e Intent nal recollect on and other c mponent

The furthe laboration f th Linear diagram will have reckon with the as umption that the ystem foll wi g the *P* represents the one hich we mus tribute conscio sness (*C*) so that $P = C$

Th firs i d ca f the element f regres is already encou ed the wri rs f Albertu M us. Accord g t h m the m g *so co* ructs th dre m t f the tangibl bjects which l h retained. The

processes of our normal thinking likewise neces sitate a retrogression in the psychic apparatus from some complex act of ideation to the raw material of the memory traces which underlie it But during the waking state this turning backwards does not reach beyond the memory images it is incapable of producing the hallu cinatory revival of the perceptual images Why is it otherwise in dreams? When we poke of the condensation work of the dream we could not avoid the assumption that by the dream work the intensities adhering to the ideas are completely transferred from one to another It is probably this modification of the usual psy chic process which makes possible the cathex is of the system of *P* to its full sensory viv idness in the reverse direction to thinking

I hope that we are not deluding ourselves as regards the importance of this present dis cussion We have done nothing m [illegible] a [illegible] it [illegible] b [illegible] or [illegible] but even this step requires justifi cation Why this definition if it does not teach us anything new? Well I believe that the word *regression* is of service to us inasmuch as it connects a fact familiar to us with the scheme of the psychic apparatus endowed with direc tion At this point and for the first time we shall profit by the fact that we have constructed such a scheme For with the help of this scheme we shall perceive without further reflection another peculiarity of dream formation If we look upon the dream as a process of regres sion within the hypothetical psychic apparatus we have at once an explanation of the empi rically proven fact that all thought relations of the dream thoughts are either lost in the dream work or have difficulty in achieving ex pression According to our scheme these thought relations are contained not in the first *mem* systems but in those lying farther to the front and in the regression to the perceptual images they must forfeit expression *In regres sion the structure of the dream thoughts breaks up into its raw material*

But what change renders possible this regres sion which is impossible during the day? Let us here be content with an assumption There must evidently be changes in the cathexis of the individual systems causing the latter to become more accessible or inaccessible to the discharge of the excitation but in any such apparatus the same effect upon the cour e of the excitation might be produced by more than one kind of change We naturally think of the sleeping state and of the many cathectic changes which this evokes at the sensory end of the apparatus During the day there is a continuous stream flowing from the ψ system of the *P* toward the motility end this current ceases at night and can no longer block the flow of the current of excitation in the oppo site direction This would appear to be that *seclusion from the outer world* which accord ing to the theory of some writers is suppo ed to explain the psychological character of the dream In the explanation of the regression of the dream we shall however have to take into account those other regressions which occur during morbid waking states In these other forms of regression the explanation just given plainly leaves us in the lurch Regression occurs in spite of the uninterrupted sensory current in a progressive direction

The hallucinations of hysteria and paranoia as well as the visions of mentally normal per sons I would explain as corresponding in fact, to regressions i e to thoughts transformed into images and would assert that only such thoughts undergo this transformation as are in intimate connection with suppressed memories or with memories which have remained un conscious As an example I will cite the case of one of my youngest hysterical patients—a boy of twelve who was prevented from fallir asleep by green faces with red eyes which terrified him The source of this manifestation was the suppressed but once conscious mem ory of a boy whom he had often seen four years earlier and who offered a warning ex ample of many bad habits including mastur bation for which he was now reproaching him self At that time his mother had noticed that the complexion of this ill mannered boy was *g eenish* and that he had *red* (i e red rimmed) *eyes* Hence his terrifying vision which mere ly determined his recollection of another say ing of his mother s to the effect that such boys become demented are unable to learn anything at school and are doomed to an early death A part of this prediction came true in the case of my little patient he could not get on at school and as appeared from his involuntary associations he was in terrible dread of the re mainder of the prophecy However after a brief period of successful treatment his sleep was restored his anxiety removed and he fin

F om the G eek *K the* to ccupy d h e in pl c f the tho t m *Be t g t* s gn fy a charge r i estm t of e e gy —TR

ished his scholastic year with an excellent record.

Here I may add the interpretation of a vision described to me by an hysterical woman of forty as ha ing occurred when she was in normal health. One morning she opened her eyes and saw h brother in the oom although she knew him to be onfined in a insane asylum H r little son was asleep by her s de. Lest the child *should be frighten d* on see ng his

1

of e of he childish memo es ... though conscious was most intimat ly connected with all the unco cious material in her mind Her urs rymaid had told her that her m the who had died young (my patient was then only eighteen months old) had suffered fr m epilept c or hyst rical o vuls ons which dated back to a fright caused by her b othe (*the pati t s u cle*) wh appeared to her disguised as a spectr with a *sheet* over h s h ad. The visio contains th same eleme ts a th reminiscence viz the appearance of *the brother the sheet* the *fright* a d its ef f t These elements however are arranged in fresh o text and tran ferred t oth er pers s The obv m t e of th vis on and th thought which it replac d was her solicitud lest h r little so who bo e a trik ing resemblan e to his uncl should ha the latter's fate.

B th examples here cited are not e tirely unrelated t the state of sleep and m y fo that eason be unfitted to aff rd th evidence fo th sake of which I ha e cited th m I will th ef re refer t my analys s of an hallucina t ry paran w man pat ent and to the results f my hitherto unpublished st dies on th psychol gy of the psych eurose in ord to emphasize the fact that these cases of egres- e th ght-transf rm tio one mu t t over look the nfl enc of a suppre sed memory one that has remained un nscious this being usually f an infantil charact This m mory draws into th regressio as it were, the thoughts with which t is connect d and which are kept f m xpress on by the censo hip—that is, into that f rm of representa ti in which the m mory tself is psychically xi tent. And here I may add a result of my t dies of hysteria that f o e ucceeds in bringing t consci usnes infantil scenes (whether they are recollections or phantasies) th y appear as hallucinations and are di ested of this character only when they are *communi* cated It is known also that even in persons whose memories are not otherwise visual the earliest infantile memories remain vividly visual until late in life

If now we bear in mind the part played in the dream thoughts by the infant le experi ences or by the phantasies based upon them and recollect how often fragments of these re emerge in the dream-content and how even the dream wishes often p oceed from them we cannot deny the probab lity that in dreams too the transformation of th ughts into visual images m y be the result of the *att action* ex e cised by the visually repre ented memory striving for resuscitat on upon the thoughts severed from the consciousness and struggling for express on Pursuing this conceptio we may further describe the dream as the *s b- stitute for the i fa tile scene mod fied by t ans ference to recent material* The nfantile scene cannot enfo ce its own revi al and must there for be satisfied to return as a dream

This refere ce to the significa ce of the in fantile scenes (or of their phantastic repeti tions) as in a certai degree furnishing the pattern for the dream-co te t renders superfluous the assumption made by Scherner and his pupils co cerning inner sou ces of stimuli Scherner assumes a state of *visual e citat on* of int rnal excitation in the organ of s ght when the *dreams manifest* a pecial vividness r an extrao dinary abundance of visual ele- me ts We n ed raise no objection to this as- sumptio we may pe haps content oursel es *with assuming such a state of excitat on* nly for the psychic pe ceptive system of the or gan of vis on we shall however insist that this tat of excitation is a reanim t o by the *memory* f a *former actual* ual excitation I cannot, from my own experi ce give a good exampl showing h an nfluen e of an infan til memory my own dream a e ltogether less rich in *percept al eleme ts* than I imagi e those f others to be but in my mo t beautiful and most vi d dream of lat years I can eas ly trace the hallu inatory distinctness of the dream-conte ts to the visual qualities of re cently ece ed impress ons On p 3 I mentioned dream in which th d k blue of the water the b wn of the sm ke ssuing from th ship funn ls and th sombre b own and red of the buildings whi h I saw mad a profound and lasting impress on upon my mind.

Sele d P per on H eria "Further Observations on the Defence-Neuro-Psychoses p 97 bo e.

This dream if any must be attributed to visual excitation but what was it that had brou ht my organ of vision into this excitable state? It was a recent impression which had joined itself to a series of former impressions The colours I beheld were in the first place those of the toy blocks with which my children had erected a magnificent building for my admi ration on the day preceding the dream There was the sombre red on the large blocks the blue and brown on the small ones Joined to these were the colour impressions of my last journey in Italy the beautiful blue of the Isonzo and the lagoons the brown hue of the Alps The beautiful colours seen in the dream were but a repetition of those seen in memory

Let us summarize what we have learned about this peculiarity of dreams their power of recasting their idea content in visual images We may not have explained this character of the dream work by referring it to the known laws of psychology but we have singled it out as pointing to unknown relations and have given it the name of the *regressive* character Wherever such regression has occurred we have regarded it as an effect of the resistance which opposes the progress of thought on its normal way to consciousness and of th simultaneous attraction exerted upon it by vivid memories The regression in dreams is perhaps facilitated by the cessation of the progressive stream flowing from the sense organs during the day for which auxiliary factor there must be some compensation in the other forms of regression by the strengthening of the other regressive motives We must also bear in mind that in pathological cases of regres ion just as in dreams the process of energy transference must be different from that occurrin in the re gressions of normal psychic life since it ren ders possible a full hallucinatory cathexis of the perceptive system What we have described in the analysis of the dream work as *regard for representab lity* may be referred to the *selec tive attraction* of visually remembered scenes touched by the dream thoughts

As to the regression we may further observe that it plays a no less important part in the theory of neurotic symptom formation than in the theory of dreams We may therefore dis tinguish a threefold species of regres on (*a*) a *topical* one in the sense of the scheme of the ψ systems here expounded (*b*) a *temporal* one in so far as it is a regression to older psychic formations and (*c*) a *formal* one when primi tive modes of expression and representation take the place of the customary modes These three forms of regression are however basic ally one and in the majority of cases they co incide for that which is older in point of time is at the same time formally primitive and, in the psychic topography nearer to the percep tion end

We cannot leave the theme of regression in dreams without giving utterance to an impres sion which has already and repeatedly forced itself upon us and which will return to us re inforced after a deeper study of the psycho neuroses namely that dreaming is on the whole an act of regression to the earliest relationships of the dreamer a resuscitation of his childhood of the impulses which were then dominant and the modes of expression which were then avail able Behind this childhood of the individual we are then promised an insight into the phylo genetic childhood into the evolution of the hu man race of which the development of the in dividual is only an abrid ed repetition influ enced by the fortuitous circumstances of life. We begin to suspect that Friedrich Nietzsche was right when he said that in a dream there persists a primordial part of humanity which we can no longer reach by a direct path and we are encouraged to expect from the analysis of dreams a knowledge of the archaic inheri tance of man a knowledge of psychical things in him that are innate It would seem that dreams and neuroses have preserved for us more of the psychical antiquities than we sus pected so that psycho analysis may claim a high rank among those sciences which en deavour to reconstruct the oldest and darkest phases of the beginnings of mankind

It is quite possible that we shall not find this first part of our psychological evaluation of dreams particularly satisfying We must how ever console ourselves with the thou ht that we are after all compelled to build out into the dark If we have not gone altogether astray we shall surely reach approximately the same place from another starting point and then perhaps we shall be better able to find our bearings

C *The Wish Fulfilment*

The dream of the burning child (cited above) affords us a welcome opportunity for appreci

meaning Accordin to the correct but summa ry definiti n of Ari totle the dream is a con ti uation f thinking in sleep N w if during the day our thou hts perf rm uch a di ersity of ps hic cts—judgme ts conclu ons the answ ring of objections expe tati ns inten tio etc—why hould th y be forced at night to confine themsel es t the p oducti of wishes only? Are there ot, on the co trary

a

upon his eyes while he is a leep th father draw th apprehensive onclusion that a candle has fallen over and may be burni g the body h transforms this co cl sion into a dream by embodyi g t i an b o s s tuation enacted in the prese t tense What part is played in this d am by the wish fulfilment? And h w can we possibly mistak the predom inance of th tho ght continued f om the wak ing st te or evok d by the ew sensory imp es s ?

All thes con d rat ns are justified and *force us t look more closely into the rôl of* the h f lfilm t in dreams, and the signifi can f the waking thoughts co tinued in sleep.

It is p ec sely the wi h f lfilment that has already caused us t divide all dreams into two gr ps W have found dreams whi h were plainly w sh fulfilments and oth rs in which the wi h fulfilment *was unrecognizabl* and was ften con ealed by every available mean In this latte class of d eams w recognized th fi e of th dream-cen orsh p The un di guised wi h-d eams were f und hiefly in hildren *short* frank w h-dream *seem d* (I purposely emphasize this w rd) to occur also in dults

W may ow ask whence in ea h case does the wish that is realized in th dream originat ? But t what ppo tion o t what di ers ty d we relat this *whence?* I think to the pposi tion between consci us daily life and an un conscious psychic activity which is able to make itself perceptible only at n ght I thus find a threefold possibility for the orig n of a wish Firstly t may have been exc ted during the day and owing to external circumstances may have remained u satis fied there is thus left for the n ght an acknowledged and unsatis fied wish Secondly t may ha e emerged during the day only to be rejected there is thus left for the night an unsati fied but s ppressed wish Th rd ly it may have no relation to daily life but may belong to tho e wi hes which awake o ly at night out of the suppressed material in us. If we turn t ou scheme of the psych c appa ratus we can localize a wish f the fir t order in the system *Pcs* We may assume that a w sh of the seco d order has been fo ced back from the *Pcs* system into the *Ucs* system where alone if anywh re can it ma tain itself as *for the wi h impulse of the third order we be- l eve that it s wh lly ncapable of leaving the Ucs* ystem. Now have the wishes arisi g from these different sources the same value for the dream the same power to incite a dream?

On surveyi g the dreams at our disposal with a view to answering this question we are at o e mo ed to add as a fourth source of the dream wi h the actual wi h impetus which ari es d ri g the ni ht (fo example the stim ulus of thirst and sexual des re) It the seems t us probable that the source of the dream w sh does not affect its capacity to incite a dre m I have in mind the d eam of the child who continued the oyage th t had been inter rupted during the day and the other child e s dreams cited in the same chapter they are explained by an unfulfilled but unsuppres ed wish of the daytime That wishes suppre sed duri g the day as ert them el es in dreams is shown by a great many examples I will men tion very simple dre m of this ki d A rath e sa castic lady whose younge friend has be come engaged to be married, is asked in the daytime by her acquai tances whether she k —

ly that he is a *commonplace fellow — one me ts s h by the d en (D t endmensch)* The foll wi ght h d eams that the same quest on is put to he and that she pl s with th f rmula *I c se of s bs q e t ders t wi l suffic to ment on the ef c n mber* Finally th result of mer u analyses we learn that the wish in all dreams that have been

subject to distortion has its origin in the uncon scious and could not become perceptible by day At first sight then it seems that in re spect of dream formation all wishes are of equal value and equal power

I cannot prove here that this is not really the true state of affairs but I am strongly in clined to assume a stricter determination of the dream wish Children s dreams leave us in no doubt that a wish unfulfilled during the day may instigate a dream But we must not forget that this is after all the wish of a child that it is a wish impul e of the strength n

adult it would rather seem that as we learn to control our instinctual life by intellection we more and more renounce as unprofitable the formation or retention of such intense wishes as are natural to child hood In this indeed there may be individual variations some retain the infantile type of the psychic processes longer than others just as we find such differences in the gradual de cline of the originally vivid visual imagination In general however I am of the opinion that unfulfiled wishes of the day are insufficient to produce a dream in adults I will readily admit that the wish impulses originating in conscious ness contribute to the instigation of dreams but they probably do no more The dream would not occur if the preconscious wish were not re inforced from another source

That source is the unconscious I believe that *the conscious wish becomes effective in ex citing a d*

ing a sim

it From

analysis [illegible] neuroses I believe that these unconscious wishes are always active and ready to express themselves whenever they find an opportunity of allying themselves with an im pulse from consciousness and transferring their own greater intensity to the lesser intensity of the latter It must therefore seem that the conscious wish alone has been realized in the dream but a slight peculiarity in the form of the dream will put us on the track of the pow erful ally from the unconscious These ever active and as it were immortal wishes of our unconscious recall the legendary Titans who from time immemorial have been buried un der the mountains which were once hu l d [illegible]

[illegible] the psychological investigation of the neuroses Let me therefore set aside the view previously expressed that it matters lit tle whence the dream wish originates and re place it by another namely *the wish mani fested in the dream must be an infantile wish* In the adult it originates in the *Ucs* while in the child in whom no division and censorship exist as yet between the *Pcs* and *Ucs* or in whom these are only in process of forma tion it is an unfulfilled and unrepressed wish from the waking state I am aware that this conception cannot be generally demonstrated but I maintain that it can often be demon strated even where one would not have sus pected it and that it cannot be generally refuted

In dream formation the wish impulses which are left over from the conscious waking life are therefore to be relegated to the back ground I cannot admit that they play any part except that attributed to the material of actual sensations during sleep in relation to the dream content If I now take into account those other psychic instigations left over from the waking life of the day which are not wish es I shall merely be adhering to the course mapped out for me by this line of thought We may succeed in provisionally disposing of the energetic cathexis of our waking thoughts by deciding to go to sleep He is a good sleeper who can do this Napoleon I is reputed to have been a model of this kind But we do not al ways succeed in doing it or in doing it com pletely Unsolved problems harassing care

[illegible] termed the preconscious The thought im pulses continued into sleep may be divided in to the following groups

1 Those which have not been completed during the day owing to some accidental cause

2 Those which have been left uncomplet

[illegible]

ed because our mental powers ha e failed us, e un ol ed problems

3 Th se which have been turned back and suppressed durin, the day This is rein for ed by a powerful fourth group

4. Those which ha e been e cit d in our *Ucs* during the day by the wo kings of the *Pcs* and finally we may add a fifth, consisting of h d v

the day s w king e p

nating from th group of the unsol ed iss es It s rtain that the e e citations conti u to tn e f r xpres on during the night, and we may a sume w th equal c rtainty that the state of sleep renders impossible the usual ontinu ance f th process of e citati in the preco cious a d ts terminatio in becoming con ci us In so f r as we can become c n cious f our mental proces es in the ordin ry way ev during the night to that extent we are mply ot asleep I cannot say what chan e is produced in the *Pcs* system by the state of leep but th re s o d bt that the psychological chara teristics of leep are to be sought m inly in the cathect changes occurring just in this system, whi h dominates m reover the pp oa h to motility paralysed during leep On the ther hand I ha e found n thi g in the psych l gy of dreams to warrant the as sumpti that leep prod es ny but secon dary changes in the co ditions of the *Ucs* system Hence f th octurnal excitations in th *P* there emains no th path than that taken by the wi h-excitations from the *Ucs* they must seek re f ceme t from the *Ucs* d f llow the detours of the un nsci us x citations. But what s th relation of the pre n c us day residues t the dream? There is doubt that they pen trat bundantly into the dream that they utilize the dream-co tent t obtrud themsel es upon consciousnes even d ring the night indeed they somet mes even dominate the dream-content, nd impel t t cont ue the w k of the day t is also r t that the day esid es may just as well ha e any othe haracte s that of wishes B t t is hi hly instructive and f r the theory f wi h fulfilment of quite decis ve importance to see what cond tions they must comply with in order to be rece ved into the dream.

Let us p ck out one of the dreams c ted above e g the dream in which my friend Otto eems to show the symptoms of *Basedow's d s ease* (p 249) Otto s appearance ga e me ome co cern during the day and this worry like e erything else relating to him greatly affected me I may assume that this concern followed me into sleep I was probably bent on findin out what was the matter with him Dur

friend Otto with a certain Baron L a d myself

ad antage of the opportunity to creep into the dream but the worry f the d y had likewise found ome sort of express on by means of a substitute in the dream-content. The day thought, which wa in tself not a wish but on the contrary a worry had n ome way to find a connection with some infantile wi h now unconsc ous and suppres ed which then allowed it—duly dressed up—to *arise* f r con ciousn ss The more domineering the worry the more forced could be the connect on to be established between the content of th wi h and that f the worry the need be no connec tion n was there one in our example

It would perh ps be appropri te in deal ng with this p oblem to inquire how a d eam be haves when m terial is ff red to it in the d eam th ghts whi h flatly oppo es a wish fulfilment su h as justified w rries painful reflecti ns and distressing realizations The

Th then, results in a pure and simpl sat f tio -dream, a palpable wi h *fulfilment* on cerning which th re is nothing more t be said.

(*b*) The painful deas find th ir way into the

manifest dream content more or less modi fied but nevertheless quite recognizable This is the case which raises doubts about the wish theory of dreams and thu calls for further investigation Such dreams with a painful con tent may either be indifferent in feeling or they may convey the whole painful affect which the ideas contained in them seem to justify or they may even lead to the develop ment of anxiety to the point of waking

Analysis then shows that even these painful dreams are wish fulfilments An unconscious and repressed wish whose fulfilment could only be felt as painful by the dreamer s ego has seized the opportunity offered by the con tinued cathexis of painful day residues has lent them its support and has thus made them capable of being dreamed But whereas in case *(a)* the unconscious wish coincided with the conscious one in case *(b)* the discord between the unconscious and the conscious—the re pressed material and the ego—is revealed and the situation in the fairy tale of the three wishes which the fairy offers to the married couple is realized (see p 534 below) The gratification in respect of the fulfilment of the repressed wish may prove to be so great that it balances the painful affects adhering to the day residues the dream is then indifferent in its affective tone althou h it is on the one hand the fulfilment of a wish and on the other the fulfilment of a fear Or it may happen that the sleeper s ego plays an even more extensive part in the dream formation that it reacts with vio lent resentment to the accomplished satisfac tion of the repressed wish and even goes so far as to make an end of the dream by means of anxiety *It* is thus not difficult to recognize that dreams of pain and anxiety are in accord ance with our theory just as much wish ful filments as are the straightforward dreams of gratification

Painful dreams may also be *punishment dreams* It must be admitted that the recogni tion of these dreams adds something that is in a certain sense new to the theory of dreams What is fulfilled by them is once more an un conscious wish—the wish for the punishment of the dreamer for a repressed prohibited wish impulse To this extent these dreams comply with the requirement here laid down that the motive power behind the dream formation must be furnished by a wish belonging to the unconscious But a finer psychological dissec tion allows us to recognize the difference be tween this and the other wish-dreams In the dreams of group *(b)* the unconscious dream forming wish belonged to the repres ed ma terial In the punishment dreams it is likewise an unconscious wi h but one which we must attribute not to the repressed material but to the *ego*

Punishment dreams point therefore to the possibility of a still more extensive participa tion of the ego in dream formation The mech anism of dream formation becomes indeed in every way more transparent if in place of the antithesis *conscious* and *unconscious* we put the antithesis *ego* and *repressed* This how ever cannot be done without taking into ac count what happens in the psychoneuroses, and for this reason it has not been done in this book Here I need only remark that the oc currence of punishment dreams is not generally subject to the presence of painful day residues. They originate indeed most readily if the con trary is true if the thoughts which are day residues are of a gratifying nature but express illicit gratifications Of the e thoughts noth ing then finds its way into the manifest dream except their contrary just as was the ca e in the dreams of group *(a)* Thus it would be the essential characteristic of punishment-dreams that in them it is not the unconscious wish from the repressed material (from the system *Ucs*) that is responsible for dream formation but the punitive wish reacting against it a wish per taining to the ego even though it is uncon scious (i e preconscious)

I will elucidate some of the foregoin obser vations by means of a dream of my own and above all I will try to show how the dream work deals with a day residue involving pain ful expectation

Indistinct beginning *I tell my wife I have some news for her something very special She becomes frightened and does not wish to hear it I assure her that on the contrary it is some thing which will please her greatly and I begin to tell her that our son s Officers Corps has sent a sum of money (5 000 k ?) something about honourable mention dist ibution at the same time I have gone with her into a small room like a store room in order to fetch something from it Suddenly I see my son ap pea he is not in uniform but rather in a tight fitting spo ts suit (like a seal?) with a smal cap He climbs on to a basket which stands to one side nea a cl est in order to put some thing on tl is chest I add ess l im no answer*

H may d th d f th super-ego which was l t r rec gn ed by psycho-a alysis.

It seems to me that his face or f ehead is band g d he arranges someth ng in his mou h push ng someth g i to i Also h.s hair shows a glint f grey I refle t Can he be so ex hau sted? A d has he false teeth? B fo e I can address h m again I awake without anxiety but with palp t tons My clock poi ts to 2 30 a m

To give a full analysis is o ce more imposs ble I shall th r fore co fin myself to emphasizing some decisive points Painful expectations of the day had gi en occas on for this dream o c ag in there had been no news for over a week from my on who was fi htin at the Fro t It is e sy to see that i the dream-con tent the c viction that he has been killed or wounded finds express on. At the beginning of the dream o e can observe an energetic effort to replace the painf l tho ghts by th con trary I ha e to impart something very pleas ing something abo t sending mo ey honour abl men

ui a y among the from ts theme) But this ffort fails The boy mothe has a pre entiment of omething t rrible and does n t wi h to li ten. Th d guises are too thin the referen e t th material t be supp essed hows th gh e erywhe e If my on killed th his c mrad s will end back his property I hall ha to distrib t whatever he has l ft amo g his s ters brothers and other people H ourabl m ntion is frequ tly aw rded to a ffi e fte he has d d the he o s death Th d am thus strives to give direct expres-s on to what t at first wi.hed to deny whilst at the same t m the wi h fulfilling tendency reveals tself by disto tion. (The hange of lo-cal ty in the d eam is n doubt to be unde stood s threshold symbolism in line with S l-bere s w) We have indeed n der lends does i tle) b ui ing r unc —tle is not in uniform b t in a ports u t that is the pl ce f th f tal ty now d eaded b s been taken by an ident which happened to him t n time when he w ki run when he f ll and fractured h s thigh. B t th nature f hi cost m which m k s him look like a seal recalls mmediately a younge person ou com cal l ttle gr d the grey ha r r calls his f th r so in law who has had a bad t m i the Wa What does thi s gnify? But let us leave this the locality a pantry the chest, from which he wants to take somethi g (in the dream to put something on it) are unmistakable allusions to an accident of my own brou ht upon myself when I was between two and three years of age I climbed on a foot-stool in the pantry in order to get m h

t

have knocked all my teeth out At this point an admonition prese ts itself it erves you right—like a hostile impulse against the valiant warrior A prof under analysis enables me to det ct the hidden impulse which would be able to find satisfaction in the d eaded mi.hap to my on It i the envy of youth which the elderly man believes that he has thoroughly stifled in ctual life There is no mistak ng the fact that it w s the very intensity of the pa n ful apprehension lest such a mi fortune should really happen that earched out for its allevia ti n such a repressed wish fulfilment

I can now clearly define what the uncon scious wish means for the d eam I will ad mit that there is a whole class of dreams in which the *incitement* originates ma nly or even e clu ively from the residues of the day and returning to the dream about my frie d Otto I believe that even my desire to become at last a *pr fe sor ext aord narius* would have al l w d m to sle p in peace that night, had not th d y s concern for my friend s health con ti ued acti e B t this worry alo e would not hav prod ced a dream th

i as the moti e power of the dream To put t figurati ely it is quite pos ible that a day thought plays the part f th *ent epreneur* in the dream but the *ent epre eur* wh as we say has the idea and fe l mpelled t realize it can do nothing with ut *ap tal* h needs a *c pitalist* who will def y the xpense, and thus c p tal st who on tributes the psychic expenditure for the dream is i variably a d indisputably whatever the nature of th waking tho ghts *a wish f om the un on*

In other cases the cap talist h mself is the *ent preneur* this indeed, seems to be the more usual case An u cious wi h is ex ted by th d y s w k and this now creates the dream And th dream p cesses p vid a parallel for all th other pos.*bil ti of th eco m c la ti nship here u d as an illu trati n Thus the *ent pren ur* may hims.lf contribute a little

of the capital or several *entrepreneurs* may seek the aid of the same capitalist or several capitalists may jointly supply the capital required by the *entrepreneurs* Thus there are dreams sustained by more than one dream wish and many similar variations which may be readily imagined and which are of no further interest to us What is still lacking to our discussion of the dream wish we shall only be able to complete later on

The *tertium comparationis* in the analogies here employed the quantitative element of which an allotted amount is placed at the free disposal of the dream admits of a still closer application to the elucidation of the dream structure As shown on p 263 we can recognize in most dreams a centre supplied with a special sensory intensity This is as a rule the direct representation of the wish fulfilment for if we reverse the displacements of the dream work we find that the psychic intensity of the elements in the dream thoughts is replaced by the *sensory* intensity of the elements in the dream content The elements in the neighbourhood of the wish fulfilment have often nothing to do with its meaning but prove to be the offshoots of painful thoughts which are opposed to the wish But owing to their connection with the central element often artificially established they secure so large a share of its intensity as to become capable of representation Thus the representative energy of the wish fulfilment diffuses itself over a certain sphere of association within which all elements are raised to representation including even those that are in themselves without resources In dreams containing several dynamic wishes we can easily separate and delimit the spheres of the individual wish fulfilments and we shall find that the gaps in the dream are often of the nature of boundary zones

Although the foregoing remarks have restricted the significance of the day residues for the dream they are none the less deserving of some further attention For they must be a necessary ingredient in dream formation inasmuch as experience reveals the surprising fact that every dream shows in its content a connection with a recent waking impression often of the most indifferent kind So far we have failed to understand the necessity for this addition to the dream mixture (p 212) This necessity becomes apparent only when we bear in mind the part played by the unconscious wish and seek further information in the psychology of the neuroses We shall then learn that an unconscious idea as such is quite incapable of entering into the preconscious, and that it can exert an influence there only by establishing touch with a harmless idea already belonging to the preconscious to which it transfers its intensity and by which it allows itself to be screened This is the fact of *transference* which furnishes the explanation of so many surprising occurrences in the psychic life of neurotics The transference may leave the idea from the preconscious unaltered, though the latter will thus acquire an unmerited intensity or it may force upon this some modification derived from the content of the transferred idea I trust the reader will pardon my fondness for comparisons with daily life but I feel tempted to say that the situation for the repressed idea is like that of the American dentist in Austria who may not carry on his practice unless he can get a duly installed doctor of medicine to serve him as a signboard and legal cover Further just as it is not exactly the busiest physicians who form such alliances with dental practitioners so in the psychic life the choice as regards covers for repressed ideas does not fall upon such preconscious or conscious ideas as have themselves attracted enough of the attention active in the preconscious The unconscious prefers to entangle with its connections either those impressions and ideas of the preconscious which have remained unnoticed as being indifferent or those which have immediately had attention withdrawn from them again (by rejection) It is a well known proposition of the theory of associations confirmed by all experience that ideas which have formed a very intimate connection in one direction assume a negative type of attitude towards whole groups of new connections I have even attempted at one time to base a theory of hysterical paralysis on this principle

If we assume that the same need of transference on the part of the repressed ideas of which we have become aware through the analysis of the neurosis makes itself felt in dreams also we can at once explain two of the problems of the dream namely that every dream analysis reveals an interweaving of a recent impression and that this recent element is often of the most indifferent character We may add what we have already learned elsewhere that the reason why these recent and indifferent elements so frequently find their way into the dream-content as substitutes for the very oldest elements of the dream thoughts

is that they have the least to fear from the resisting censorship. But while this freedom from censorship explains only the preference shown to the trivial elements, the constant presence of recent elements points to the necessity for transference. Both groups of impressions satisfy the demand of the repressed ideas for material still free from associations, the indifferent ones because they have offered no occasion for extensive associations, and the recent ones because they have not had sufficient time to form such associations.

We thus see that the day residues, among which we may now include the indifferent impressions, not only borrow something from the *Ucs* when they secure a share in dream formation—namely, the motive-power at the disposal of the repressed wish—but they also offer to the unconscious something that is indispensable to it, namely *the points of attachment* necessary for transference. If we wished to penetrate more deeply into the psychic processes, we should have to throw a clearer light on the play of excitations between the preconscious and the unconscious, and indeed the study of the psychoneuroses would impel us to do so, but dreams, as it happens, give us no help in this respect.

Just one further remark as to the day residues. There is no doubt that it is really these that disturb our sleep, and not our dreams, which, on the contrary, strive to guard our sleep. But we shall return to this point later.

So far we have discussed the dream wish; we have traced it back to the sphere of the *Ucs* and have analysed its relation to the day residues, which, in their turn, may be either wishes or psychic impulses of any other kind, or simply recent impressions. We have thus found room for the claims that can be made for the dream-forming significance of our waking mental activity in all its multifariousness. It might even prove possible to explain, on the basis of our train of thought, those extreme cases in which the dream, continuing the work of the day, brings to a happy issue an unsolved problem of waking life. We merely lack a suitable example, to analyse it in order to uncover the infantile or repressed source of wishes the tapping of which has so successfully reinforced the efforts of the preconscious activity. But we are not a step nearer to answering the question: Why is it that the unconscious can furnish in sleep nothing more than the motive-power for a wish fulfilment? The answer to this question must elucidate the psychic nature of the state of wishing, and it will be given with the aid of the notion of the psychic apparatus.

We do not doubt that this apparatus too has only arrived at its present perfection by a long process of evolution. Let us attempt to restore it as it existed in an earlier stage of capacity. From postulates to be confirmed in other ways, we know that at first the apparatus strove to keep itself as free from stimulation as possible, and therefore, in its early structure, adopted the arrangement of a reflex apparatus, which enabled it promptly to discharge by the motor paths any sensory excitation reaching it from without. But this simple function was disturbed by the exigencies of life, to which the apparatus owes the impetus toward further development. The exigencies of life first confronted it in the form of the great *physical needs*. *The excitation aroused by the* inner need seeks an outlet in motility, which we may describe as *internal change* or *expression of the emotions*. The hungry child cries or struggles helplessly. But its situation remains unchanged, for the excitation proceeding from the inner need has not the character of a momentary impact, but of a continuing pressure. A change can occur only if, in some way (in the case of the child by external assistance) there is an *experience of satisfaction* which puts an end to the internal excitation. An essential constituent of this experience is the appearance of a certain percept (of food in our example), the memory image of which is henceforth associated with the memory-trace of the excitation arising from the need. Thanks to the established connection, there results, at the next occurrence of this need, a psychic impulse which seeks to revive the memory image of the former percept, and to re-evoke the former percept itself; that is, it actually seeks to re-establish the situation of the first satisfaction. Such an impulse is what we call a wish; the reappearance of the perception constitutes the wish fulfilment, and the full cathexis of the perception, by the excitation springing from the need, constitutes the shortest path to the wish fulfilment. We may assume a primitive state of the psychic apparatus in which this path is actually followed, i.e., in which the wish ends in hallucination. This first psychic activity therefore aims at an identity of perception: that is, at a repetition of that perception which is connected with the satisfaction of the need.

This primitive mental activity must have

been modified by bitter practical experience into a secondary and more appropriate activity The establishment of identity of perception by the short regressive path within the apparatus does not produce the same result in another re pect as follows upon cathexis of the same perception coming from without The satisfaction does not occur and the need continues In order to make the internal cathexis equivalent to the external one the former would have to be continuously sustained just as actually happens in the hallucinatory psychoses and in hunger phantasies which exhaust their performance in *maintaining their hold* on the object desired In order to attain to more appropriate use of the psychic energy it becomes necessary to suspend the full regression so that it does not proceed beyond the memory image and thence can seek other paths leading ultimately to the production of the desired identity from the side of the outer world This inhibition as well as the subsequent deflection of the excitation becomes the task of a second system which controls voluntary motility i e a system whose activity first leads on to the use of motility for purposes remembered in advance But all this complicated mental activity which works its way from the memory image to the production of identity of perception via the outer world merely represents *a roundabout way to wish fulfilment* made necessary by experience Thinking is indeed nothing but a substitute for the hallucinatory wish and if the dream is called a wish fulfilment this becomes something self-evident since nothing but a wish can impel our psychic apparatus to activity The dream which fulfils its wishes by following the short regressive path has thereby simply preserved for us a specimen of the *primary* method of operation of the psychic apparatus which has been abandoned as inappropriate What once prevailed in the waking state when our psychic life was still young and inefficient seems to have been banished into our nocturnal life just as we still find in the nursery those discarded primitive weapons of adult humanity the bow and arrow *Dreaming is a fragment of the superseded psychic life of the child* In the psychoses those modes of operation of the psychic apparatus which are normally suppres ed in the waking state reassert themselves and thereupon betray their inability to satisfy our demands in the outer world

The uncon cious wish impulses evidently strive to assert them elves even during the day and the fact of transference as well as the psychoses tells us that they endeavour to force their way through the preconscious sy tem to consciousness and the command of motility Thus in the censorship between *Ucs* and *Pcs* which the dream forces us to a sume we must recognize and respect the guardian of our psychic health But is it not carelessness on the part of this guardian to diminish his vigilance at night and to allow the suppressed impulses of the *Ucs* to achieve expression thus again making possible the process of hallucinatory regression? I think not for when the critical guardian goes to rest—and we have proof that his slumber is not profound—he takes care to close the gate to motility No matter what impulses from the usually inhibited *Ucs* may bustle about the stage there is no need to interfere with them they remain harmless because they are not in a position to set in motion the motor apparatus which alone can operate to produce any change in the outer world. Sleep guarantees the security of the fortress which has to be guarded The state of affairs is less harmless when a displacement of energies is produced not by the decline at night in the energy put forth by the critical censorship but by the pathological enfeeblement of the latter or the pathological reinforcement of the unconscious excitations and this while the preconscious is cathected and the gates of motility are open The guardian is then overpowered the unconscious excitations subdue the *Pcs* and from the *Pcs* they domin te our peech and action or they enforce hallucinatory regressions thus directing an apparatus not designed for them by virtue of the attraction exerted by perceptions on the distribution of our psychic energy We call this condition psychosis

We now find ourselves in the most favourable position for continuing the construction of our psychological scaffolding which we left after inserting the two systems *Ucs* and *Pcs*

In other wo d the t d u of *t t j* *r l ty* ec g l d s n ce ry Le Lo j tly t ls th wi h f lfilm t of d e ms *S s fat g série a ét* *ec ur d tt lutt p dt t l g q bl gé d c d l j e p s t* [W th t f t g e w th t be g bl g d t h rse to th t l g a d st bbor st ggl wh ch exh u ts d w rs aw y ple s es s ght.]

However, we still have reason to give further consideration to the wish as the sole psychic motive-power in the dream. We have accepted the explanation that the reason why the dream is in every case a wish-fulfilment is that it is a function of the system *Ucs*, which knows no other aim than wish-fulfilment, and which has at its disposal no forces other than the wish-impulses. Now if we want to continue for a single moment longer to maintain our right to develop such far-reaching psychological speculations from the facts of dream-interpretation, we are in duty bound to show that they insert the dream into a context which can also embrace other psychic structures. If there exists a system of the *Ucs*—or something sufficiently analogous for the purposes of our discussion—the dream cannot be its sole manifestation; every dream may be a wish-fulfilment, but there must be other forms of abnormal wish-fulfilment as well as dreams. And in fact the theory of all psychoneurotic symptoms culminates in the one proposition that *they too must be conceived as wish-fulfilments of the unconscious*. Our explanation makes the dream only the first member of a series of the greatest importance for the psychiatrist, the understanding of which means the solution of the purely psychological part of the psychiatric problem. But in other members of this group of wish-fulfilments—for example, in the hysterical symptoms—I know of one essential characteristic which I have so far failed to find in the dream. Thus, from the investigations often alluded to in this treatise, I know that the formation of an hysterical symptom needs a *junction* of both the currents of our psychic life. The symptom is not merely the expression of a realized unconscious wish; the latter must be joined by another wish from the preconscious, which is fulfilled by the same symptom; so that the symptom is at least doubly determined, once by each of the conflicting systems. Just as in dreams, there is no limit to further *over-determination*. The determination which does not derive from the *Ucs* is, as far as I can see, invariably a thought-stream of reaction against the unconscious wish, for example, a self-punishment. Hence I can say, quite generally, that *an hysterical symptom originates only, where two contrary wish-fulfilments, having their source in different psychic systems, are able to meet in a single expression*. Examples would help us but little here, as nothing but a complete unveiling of the complications in question can carry conviction. I will therefore content myself with the bare assertion, and will cite one example, not because it proves anything, but simply as an illustration. The hysterical vomiting of a female patient proved, on the one hand, to be the fulfilment of an unconscious phantasy from the years of puberty—namely, the wish that she might be continually pregnant, and have a multitude of children; and this was subsequently supplemented by the wish that she might have them by as many fathers as possible. Against this immoderate wish there arose a powerful defensive reaction. But as by the vomiting the patient might have spoilt her figure and her beauty, so that she would no longer find favour in any man's eyes, the symptom was also in keeping with the punitive trend of thought, and so, being admissible on both sides, it was allowed to become a reality. This is the same way of acceding to a wish-fulfilment as the queen of the Parthians was pleased to adopt in the case of the triumvir Crassus. Believing that he had undertaken his campaign out of greed for gold, she caused molten gold to be poured into the throat of the corpse. "Here thou hast what thou hast longed for!"

Of the dream we know as yet only that it expresses a wish-fulfilment of the unconscious, and apparently the dominant preconscious system permits this fulfilment when it has compelled the wish to undergo certain distortions. We are moreover not in fact in a position to demonstrate regularly the presence of a train of thought opposed to the dream-wish, which is realized in the dream as well as its antagonist. Only now and then have we found in dream-analyses signs of reaction-products, as, for instance, my affection for my friend R in the *dream of my uncle* (p. 1[illegible]9). But the contribution from the preconscious which is missing here may be found in another place. The dream can provide expression for a wish from the *Ucs* by means of all sorts of distortion, once the dominant system has withdrawn itself into the *wish to sleep*, and has realized this wish by

Expressed more exactly: One portion of the symptom corresponds to the unconscious wish-fulfilment, the other corresponds to the reaction-formation opposed to it.

Hughlings Jackson has expressed himself as follows: 'Find out all about dreams, and you will have found out all about insanity.'

Cf. my latest formulation (in *Zeitschrift für Sexualwissenschaft*, Ed. I) of the origin of hysterical symptoms in the treatise on Hysterical Phantasies and their Relation to Bisexuality, *Collected Papers*, II, p. 51. This forms chapter X of *Selected Papers on Hysteria*, p. [illegible] above.

producing the changes of cathexis within the psychic apparatus which are within its power thereupon holding on to the wish in question for the whole duration of sleep

Now this persistent wish to sleep on the part of the preconscious has a quite general facilitating effect on the formation of dreams Let us recall the dream of the father who by the gleam of light from the death chamber was led to conclude that his child s body might have caught fire We have shown that one of the psychic forces decisive in causing the father to draw this conclusion in the dream instead of allowing himself to be awakened by the gleam of light was the wish to prolong the life of the child seen in the dream by one moment Other wishes originating in the repressed have probably escaped us for we are unable to analyse this dream But as a second source of motive power in this dream we may add the father s desire to sleep for like the life of the child the father s sleep is prolonged for a moment by the dream The underlying motive is Let the dream go on or I must wake up As in this dream so in all others the wish to sleep lends its support to the unconscious wish On pa e 189 we cited dreams which were manifestly dreams of convenience But in truth all dreams may claim this designation The efficacy of the wish to go on sleeping is most easily recognized in the awakening dreams which so elaborate the external sensory stimulus that it becomes compatible with the continuance of sleep they weave it into a dream in order to rob it of any claims it might make as a reminder of the outer world *But this wish to go on sleeping* must also play its part in permitting all other dreams which can only act as disturbers of the state of sleep from within Don t worry sleep on it s only a dream is in many cases the sug estion of the *Pcs* to consciousness when the dream gets too bad and this describes in a quite general way the attitude of our dominant psychic activity towards dreaming even though the thought remains unuttered I must draw the conclusion that *throughout the whole of our sleep we are just as certain that we are dreaming as we are certain that we are sleeping* It is imperative to disregard the objection that our consciousness is never directed to the latter knowledge and that it is directed to the former knowledge only on special occasions when the censorship feels as it were taken by surprise On the contrary there are persons in whom the retention a night of the knowledge that they are sleepin and dreaming becomes quite manifest and who are thus apparently endowed with the conscious faculty of guiding their dream life Such a dreamer for example is dissatisfied with the turn taken by a dream he breaks it off without waking and begins it afresh, in order to continue it along different lines just like a popular author who upon request gives a happier ending to his play Or on another occasion when the dream places him in a sexually exciting situation he thinks in his sleep I don t want to continue this dream and exhaust myself by an emission I would rather save it for a real situation

The Marquis Hervey (Vaschide) declared that he had gained such power over his dreams that he could accelerate their course at will and turn them in any direction he wished It seems that in him the wish to sleep had accorded a place to another a preconscious wi h, the wish to observe his dreams and to derive pleasure from them Sleep is just as compatible with such a wish resolve as it is with some proviso as a condition of waking up (wet nurse s sleep) We know too that in all persons an interest in dreams greatly increases the number of dreams remembered after waking

Concerning other observations as to the guidance of dreams Ferenczi states The dream takes the thought that happens to occupy our *psychic life at the moment and* elaborates it from all sides It lets any given dream picture drop when there is a danger that the wish fulfilment will miscarry and attempts a new kind of solution until it finally succeeds in creating a wish fulfilment that satisfies in one compromise both instances of the psychic life

D *Waking Caused by Dreams The Function of Dreams The Anxiety Dream*

Now that we know that throughout the night the preconscious is orientated to the wish to sleep we can follow the dream process with proper understanding But let us first summarize what we already know about this process We have seen that day residues are left over from the waking activity of the mind residues from which it has not been possible to withdraw all cathexis Either one of the unconscious wishes has been aroused through the waking activity during the day or it so happens that the

Th s d a h bee bo wed f m the th ry f sleep of Lieb ult wh d hyp t es h mod rn times (*Du S mm l p qué* tc. P is [1889])

two comode we have already discussed the multifarious possibilities. Either already during the day or only on the establishment of the state of sleep the unconscious wish has made its way to the day residues and has effected a transference to them. Thus there arises a wish transferred to recent material or the suppressed recent wish is revived by a reinforcement from the unconscious This wish now endeavours to make its way to consciousness along the normal path of the thought processes through the preconscious to which indeed it belongs by virtue of one of its constituent elements. It is however confronted by the censorship which still subsists and to whose influence it soon succumbs. It now takes on the distortion for which the way has already been paved by the transference to recent material. So far it is on the way to becoming something resembling an obsession, a delusion, or the like, i.e., a thought reinforced by a transference and distorted in expression owing to the censorship. But its further progress is now checked by the state of sleep of the preconscious this system has presumably protected itself against invasion by diminishing its excitations. The dream-process therefore, takes the regressive course, which is just opened up by the peculiarity of the sleeping state and in so doing follows the attraction exerted on it by memory-groups, which are in part only themselves present as visual cathexes not as translations into the symbols of the later systems On its way to regression it acquires representability The subject of compression will be discussed later. The dream-process has by this time covered the second part of its contorted course The first part threads its way progressively from the unconscious scenes or phantasies to the preconscious while the second part struggles back from the boundary of the censorship to the tract of the perceptions But when the dream process becomes a perception-content, it has, so to speak, evaded the obstacle set up in the Ps by the censorship and the sleeping state. It succeeds in drawing attention to itself and in being remarked by consciousness. For consciousness, which for us means a sense-organ for the apprehension of psychic qualities can be excited in waking life from two sources firstly from the periphery of the whole apparatus, the perceptive system and secondly from the excitations of pleasure and pain which emerge as the sole psychic qualities yielded by the transpositions of energy in the interior of the apparatus. All other processes in the ψ-systems even those in the preconscious, are devoid of all psychic quality and are therefore not objects of consciousness inasmuch as they do not provide either pleasure or pain for its perception. We shall have to assume that *these releases of pleasure and pain automatically regulate the course of the cathectic processes* But in order to make possible more delicate performances, it subsequently proved necessary to render the flow of ideas more independent of pain-signals. To accomplish this, the *Pcs* system needed qualities of its own which could attract consciousness and most probably received them through the connection of the preconscious processes with the memory system of speech-symbols which was not devoid of quality Through the qualities of this system, consciousness hitherto only a sense-organ for perception, now becomes also a sense-organ for a part of our thought-processes. There are now as it were two sensory surfaces, one turned toward perception and the other toward the preconscious thought-processes.

I must assume that the sensory surface of consciousness which is turned to the preconscious is rendered far more inexcitable by sleep than the surface turned toward the *P*-system The giving up of interest in the nocturnal thought-process is of course an appropriate procedure. Nothing is to happen in thought the preconscious wants to sleep. But once the dream becomes perception it is capable of exciting consciousness through the qualities now gained. The sensory excitation performs what is in fact its function namely it directs part of the cathectic energy available in the *Pcs* to the exciting cause in the form of attention. We *must therefore admit that the dream always has a waking effect—that is,* it calls into activity part of the quiescent energy of the *Pcs* Under the influence *of this energy it now* undergoes the process which we have described as secondary elaboration with a view to coherence and comprehensibility This means that the dream is treated by this energy like any other perception-content it is subjected to the same anticipatory ideas as far at least, as the material allows As far as this third part of the dream-process has any direction, this is once more progressive

To avoid misunderstanding it will not be amiss to say a few words as to the temporal characteristics of these dream-processes. In a very interesting discussion evidently suggested by Maury's puzzling guillotine dream, Goblot tries to demonstrate that a dream takes up no

other time than the transition period between sleeping and waking The process of waking up requires time during this time the dream occurs It is supposed that the final picture of the dream is so vivid that it forces the dreamer to wake in reality it is so vivid only because when it appears the dreamer is already very near waking *Un reve c est un réveil qui commence*

It has already been pointed out by Dugas that Goblot in order to generalize his theory was forced to ignore a great many facts There are also dreams from which we do not awaken for example many dreams in which we dream that we dream From our knowledge of the dream work we can by no means admit that it extends only over the period of waking On the contrary we must consider it probable that the first part of the dream work is already begun during the day when we are still under the domination of the preconscious The second phase of the dream work viz the alteration by the censorship the attraction exercised by unconscious scenes and the penetration to perception continues probably all through the night and accordin ly we may always be correct when we report a feeling that we have been dreaming all night even although we cannot say what we have dreamed I do not however think that it is necessary to assume that up to the time of becoming conscious the dream processes really follow the temporal sequence which we have described viz that there is first the transferred dream wish then the process of distortion due to the censorship and then the change of direction to regression etc We were obli ed to construct such a sequence for the sake of description in reality however it is probably rather a question of simultaneou ly trying this path and that and of the excitation fluctuatin to and fro until finally because it has attained the most apposite concentration one particular grouping remains in the field Certain personal experiences even incline me to believe that the dream work often requires more than one day and one night to produce its result in which case the extraordinary art manifested in the construction of the dream is shorn of its miraculous character In my opinion even the regard for the comprehensibility of the dream as a perceptual event may exert its influence before the dream attracts consciousness to itself From this point however the proce s is accelerated since the dream is henceforth subjected to the same treatment as any other perception It is like fire works which require hours for their preparation and then flare up in a moment.

Through the dream work the dream process now either gains sufficient intensity to attract consciousness to itself and to arouse the preconscious (quite independently of the time or profundity of sleep) or its intensity is insufficient and it must wait in readiness until attion becoming more alert immediately before waking meets it half way Most dreams seem to operate with relatively slight psychic intensities for they wait for the process of waking This then explains the fact that as a rule we perceive omethin dreamed if we are suddenly roused from a deep sleep Here as well as in spontaneous waking our first glance lights upon the perception content created by the dream work while the next falls on that provided by the outer world

But of greater theoretical interest are those dreams which are capable of wakin us in the midst of our sleep We may bear in mind the purposefulness which can be demonstrated in all other cases and ask ourselves why the dream that is the unconscious wish is granted the power to disturb our sleep i e the fulfilment of the preconscious wish The explanation is probably to be found in certain relations of energy which we do not yet understand If we did so we should probably find that the freedom given to the dream and the expenditure upon it of a certain detached attention repre ent a saving of energy as against the alternative case of the unconscious having to be held in check at night just as it is during the day As experience shows dreaming even if it interrupts our sleep several times a night still remains compatible with sleep We wake up for a moment and immediately fall a leep again It is like driving off a fly in our sleep we awake *ad hoc* When we fall asleep again we have removed the cause of disturbance The familiar examples of the sleep of wet nurses etc show that the fulfilment of the wish to sleep is quite compatible with the maintenance of a certain amount of attention in a given direction

But we must here take note of an objection which is based on a greater knowledge of the unconscious processes We have ourselves described the uncon cious wishes as always active whilst nevertheless as erting that in the daytime they are not strong enough to make themselves perceptible But when the state of sleep supervenes and the unconscious wish has

That the sexual int rse f ad lts ppears

The above qualification—*in so far as the two wishes are mutually compatible*—contains a suggestion that there may be cases in which the function of the dream fails The dream process is to begin with admitted as a wish fulfilment of the unconscious but if this attempted wish fulfilment disturbs the preconscious so profoundly that the latter can no longer maintain its state of rest the dream has broken the compromise and has failed to perform the second part of its task It is then at once broken off and replaced by complete awakening But even here it is not really the fault of the dream if though at other times the guardian it has now to appear as the disturber of sleep nor need this prejudice us against its averred purposive character This is not the only instance in the organism in which a contrivance that is usually to the purpose becomes inappropriate and disturbing so soon as something is altered in the conditions which engender it the disturbance then at all events serves the new purpose of indicating the change and of bringing into play against it the means of adjustment of the organism Here of course I am thinking of the anxiety dream and lest it should seem that I try to evade this witness against the theory of wish fulfilment when ever I encounter it I will at least give some indications as to the explanation of the anxiety dream

That a psychic process which develops anxiety may still be a wish fulfilment has long ceased to imply any contradiction for us We may explain this occurrence by the fact that the wish belongs to one system (the *Ucs*) whereas the other system (the *Pcs*) has rejected and suppressed it The subjection of the *Ucs* by the *Pcs* is not thoroughgoing even in perfect psychic health the extent of this suppression indicates the degree of our psychic normality Neurotic symptoms indicate to us that the two systems are in mutual conflict the symptoms are the result of a compromise in this conflict and they temporarily put an end to it On the one hand they afford the *Ucs* a way out for the discharge of its excitation—they serve it as a kind of sally gate—while on the other hand they give the *Pcs* the possibility of dominating the *Ucs* in some degree It is instructive to consider for example the significance of a hysterical phobia or of agora phobia A neurotic is said to be incapable of cro sing the street alone and this we should rightly call a *symptom* Let someo[illegible] move th[illegible]
action[illegible]
perforr[illegible] result will be an attack of anxiety just as an attack of anxiety in the street has often been the exciting cause of the establishment of an agoraphobia We thus learn that the symptom has been constituted in order to prevent the anxiety from breaking out The phobia is thrown up before the anxiety like a frontier fortress

We cannot enlarge further on this subject unless we examine the role of the affects in these processes which can only be done here imperfectly We will therefore affirm the proposition that the principal reason why the suppression of the *Ucs* becomes necessary is that, if the movement of ideas in the *Ucs* were allowed to run its course it would develop an affect which originally had the character of pleasure but which since the process of *repression* bears the character of pain The aim as well as the result of the suppression is to prevent the development of this pain The suppression extends to the idea content of the *Ucs* because the liberation of pain might emanate from this idea content We here take as our basis a quite definite assumption as to the nature of the development of affect This is regarded as a motor or secretory function the key to the innervation of which is to be found in the ideas of the *Ucs* Through the domination of the *Pcs* these ideas are as it were strangled that is inhibited from sendin out the impulse that would develop the affect The danger which arises if cathexis by the *Pcs* ceases thus consists in the fact that the unconscious excitations would liberate an affect that—in consequence of the repression that has previously occurred—could only be felt as pa n or anxiety

This danger is released if the dream process is allowed to have its own way The conditions for its realization are that repressions shall have occurred and that the suppressed wish impulses can become sufficiently stron They therefore fall entirely outside the psychological framework of dream formation Were it not for the fact that our theme is connected by just one factor with the theme of the development of anxiety namely by the setting free of

E. The Primary and Secondary Processes. R pression

In ttempting to penetrate more prof undly int the psycholo̲gy of th dream-processes I ha e und rtaken a difficult task to which in deed my powers of expos tion are hardly adequate. To reprodu e the simultaneit of so complicated a cheme in terms of a success.i e description and at the same time to make each part appea free from all assumpti n goes fai ly bey nd my powers I ha e now to atone fo the fact that i my exposition of the psy chology of dreams I ha e been un ble to foll w the hist ric developmen of my own in ight. The lines of pproach to the comprehension of the dream were laid down f me by pre i us invest gati s into the psychology of the neuroses to which I hould t refer here altho h I am constantly obliged to do so whereas I hould like to wo k in the opposite directi starting from the dream and then p oceeding t establ h its junction with the psych l y of the neuroses. I am conscious of all the difficult es wh h th in olves for the reader but I know f o way to a o d them

S ce I am di satisfied with this state of aff irs, I am glad to dwell upo oth point of iew which would seem to enhance the value of my fforts As was sh wn i the int od ctory section, I f und myself confront d with a theme wh h had been marked by the harpest contradicti s on the part f those who had writt t. In th course of ou treatment of the probl ms of the dream room has been found f most f these co tradictory iews. W ha e been mpelled to tak decided eption t tw nly f the view xpres ed nam ly that th dream is meaningles process. and that t is a somatic process. Apart f om th se we ha e been abl to fi d a place fo the truth of all the co tradictory opinions t on point the of th complicated tissue f the f ct and we ha e bee abl to show th t ea h exp essed som thi genuine and rrect. That dreams contin the impulses and int rests of waking lif has been gen raly onfirmed by th discov ry of the hidden dream-thoughts Th se co ern th m sel es only with thi gs that seem t u impo tant and f great interest D eams never occupy th m el es with trifles But we have accep ed a so the opposite iew namely that the dream gath rs up the indifferent residues of the day and cann t eize upon any important interest of the day until it has in some measure with drawn itself from waking acti ty We have found that this h lds true of the dream-content which by means of distortion gi es the dream tho ght an altered express on. We ha e said that the dream process, owing to the nature of the mechani m of as ociati n finds it ea ier to obtain pos es on of recent or indifferent material which has not yet been put under an embargo by our waking mental activity a d that, on a count of the censorship it tran fers the psychic intensity of the nificant but also objectio able material to the indifferent. The hypermnes a of the dream and its ability to dispose of infant le material have become the mai foundations of our doctrine in our theory of dreams we have assigned to a wish of infantile origin the part of the indispensable motive power of dream formation It has not of course occurred to u to doubt the experi mentally d m strated significance of external se ory timuli d ring leep but we ha e placed this m terial in the same relation to the dream wi h as the th ght res dues left o er from our waking activ y We need not dispute the fact that the dream int rpret objective sensory stimuli afte the man of an illu ion but we have supplied the m t e for this inter pretati n, which has been l ft indeterminate by oth writers The interp etation proceeds in such way that the per ei ed object s ren dered harml ss as a sour f distu banc of sleep whilst it is made usabl f r the wish ful filment. Though we d not admit as a special sou e of dreams the subjecti e state of exc ta tion f the sensory organs during sleep (which seems to have been dem nstrated by Trumb l Ladd) we are ne ertheless, abl to explai this

being inhibited—rep esent an ever ready ma terial, which th dream w l can employ t ex press the dream th ught as ften as need arises

That the dream-pro es i rap d and momentary o e is w believe true as regards the per ept by n cious ess f the preformed dream-co tent but we ha e found that

[20] W pu th case in the f f pyre del ria f la ai on for i is cerebral anaemia t we tach this particular tate.—ED.

strange and alarming to children who observe it and arouses anxiety in them is I may say a fact established by everyday experience I have explained this anxiety on the ground that we have here a sexual excitation which is not mastered by the child s understanding and which probably also encounters repulsion because their parents are involved and is therefore transformed into anxiety At a still earlier period of life the sexual impulse towards the parent of opposite sex does not yet suffer repression but as we have seen (pp 244 45) expresses itself freely

For the night terrors with hallucinations (*pavor nocturnus*) so frequent in children I should without hesitation offer the same explanation These too can only be due to misunderstood and rejected sexual impulses which if recorded would probably show a temporal periodicity since an intensification of sexual *libido* may equally be produced by accidentally exciting impressions and by spontaneous periodic processes of development

I have not the necessary observational material for the full demonstration of this explanation On the other hand pediatrists seem to lack the point of view which alone makes intelligible the whole series of phenomena both from the somatic and from the psychic side To illustrate by a comical example how closely if one is made blind by the blinkers of medical mythology one may pass by the understanding of such cases I will cite a case which I found in a thesis on *pavor nocturnus* (Debacker 1881 p 66)

A boy of thirteen in delicate health began to be anxious and dreamy his sleep became uneasy and once almost every week it was interrupted by an acute attack of anxiety with hallucinations The memory of these dreams was always very distinct Thus he was able to relate that the devil had shouted at him Now we have you now we have you! and then there was a smell of pitch and brimstone and the fire burned his skin From this dream he woke in terror at first he could not cry out then his voice came back to him and he was distinctly heard to say No no not me I haven t done anything or Please don t I will never do it again! At other times he said Albert has never done that! Later he avoided undressing because the fire attacked him only when he was undressed In the midst of these evil dreams which were endan ering his health he was sent into the country where he recovered in the course of eighteen months At the age of fifteen he confessed one day *Je n osais pas l avouer mais j éprouvais cor [illegible] lement des picotements et des surexcitations aux parties à la fin cela m énervait tant que plusieurs fois j ai pensé me jeter par la fenêtre du dortoir*

It is of course not difficult to guess 1 That the boy had practised masturbation in former years that he had probably denied it and was threatened with severe punishment for his bad habit (His confession *Je ne le ferai plus* his denial *Albert n a jamais fait ça*) 2 That under the advancing pressure of puberty the temptation to masturbate was re awakened through the titillation of the genitals 3 That now however there arose within him a struggle for repression which suppressed the libido and transformed it into anxiety and that this anxiety now gathered up the punishments with which he was originally threatened

Let us on the other hand see what conclusions were drawn by the author (p 69)

1 It is clear from this observation that the influence of puberty may produce in a boy of delicate health a condition of extreme weakness and that this may lead to a *very marked cerebral anaemia*

2 This cerebral anaemia produces an alteration of character demono maniacal hallucinations and very violent nocturnal and perhaps also diurnal states of anxiety

3 The demonomania and the self reproaches of the boy can be traced to the influences of a religious education which had acted upon him as a child

4 All manifestations disappeared as a result of a lengthy sojourn in the country bodily exercise and the return of physical strength after the termination of puberty

5 Possibly an influence predisposing to the development of the boy s cerebral state may be attributed to heredity and to the father s former syphilis

Then finally come the concluding remarks *Nous avons fait entrer cette observation dans le cadre des délires apyrétiques d inanition car*

ream thoughts proceed from perfectly normal psychic activities but on the other hand we have found among the dream thoughts a number of entirely abnormal mental processes which extend also to the dream-content, and which we reproduce in the interpretation of the dream. All that we have termed the d eam work seems t depart so completely f om the psychic processes which w recognize as correct and appropriat that th severest judgments e pressed by the writers mentioned as to the low level of psychic achievement f dreams must appear well founded.

Here, pe haps only further investigations can prov de an explanation and set us on the r ht path. Let m pick out f r renewed atten tion one of the const llations which lead to dream formati n.

W have le rned that the dream serves as a s bstitute f numbe f thoughts derived from our daily Life, and which fit together with perfect logic We cann t, theref re, doubt that these thought ha e their own rigin in our rmal mental life. All th qualities which we al e in ur thought processes, and which mark them out as c mplica ed perf rmances of a high order we shall find repeated in the dream thoughts. There is h wever no need to sume that this mental work is performed during sleep such an assumption w uld badly fuse the cep on f the psychic tate of sleep t which we have hitherto adhered. On the contrary these thoughts may ery well ha e the origin in the daytime, and unre marked by our consci usnes may ha e gone on f om th first stimulus until, t th onset of leep they have reached completion If we re t conclud anythi from this tat of affairs, t can only be that t pro es *th t the mo t omplex ment l pera ions are po sibl without th cooperation f consciousn s* — truth which w ha e had t learn anyhow from very psycho-analysi of patient suffering om h s eria bses ons. These dream oughts re ertainly in themselves incap- l f onsci usnes f w have t becom onsci us f them during the day this may been due t various reasons. The ct f ec ming conscious depends upo de nit sychi function—atten on—being brought to ear This seems t be ailable only in deter ua qua tv whi h may ha e been diverted rom the tra f thoug t in question by o uma A ther wa in which such trains of thought ma be withheld from consciousness is the f owing From our conscious reflection we know tha when applying our attention we follow a particular course. But if that course leads us to an idea which cannot with tand critici m we break off and allow the cathexis of attention to drop Now it would eem that th train of thought thus started and abandoned may continue to develop without our atten ion returning, t t unless t some point it attains a specially high inten ty which compels atten tion. An initial con cious reject on by our j dgm t, on the ground f incorrectness or uselessness for the immedia e purpose of the ct of thought may therefore be the cau e of a thou t-process go ng *n unnoticed by con sci usness* until the onset of leep

Let us now recapitulate We call such a train of thought a *preco scious* train and we believe it t be perf ctly correct, and that it may equally well be a m rely negl cted train or ne that has been nterrupted and sup- pressed. Let us also tate in plain terms how we visualize the movement f our thought We believe that a certain quantity of excitati n, whi h we call *cathect c energy* is displaced from a purposi e idea alon the ssociation paths selected by this directing idea. A *eglected* train f th ugh has received no such cathexis, and th cathexis has been withdrawn from one that was *supp re sed* or *reje ted* both ha e thus been left t their own excitations The train of thought cathected by ome aim be- comes bl und r certain co dit ns to attract the attention of con ciousness and by the mediation of con ciousness t then recei es *hyper-cathexis* We shall be obliged presently to lucidat our assumptions as t the nature and function of con ci usness

A train f thought thus incited in the *Pcs* may eithe disappear spontaneously or it may contin e. The *former eventuality* we co eive as f llows t diffuses its energy through all the association paths emanating from it, and throws the entire chain of thou hts into tate

their source in ur unconscious and eve ctive wishes. These may gain trol f the excita tion in the circle of thoughts thus l ft t tself establish co n ct on between t and the un conscious wish, and *t ansfer* to it the en rgy inherent in the unconscious wish. Hencef rth

the preceding portions of the dream process probably follow a slow fluctuating course As for the riddle of the superabundant dream content compressed into the briefest moment of time we have been able to contribute the explanation that the dream seizes upon ready made formations of the psychic life We have found that it is true that dreams are distorted and mutilated by the memory but that this fact presents no difficulties as it is only the last manifest portion of a process of distortion which has been going on from the very beginning of the dream work In the embittered controversy which has seemed irreconcilable whether the psychic life is asleep at night or can make the same use of all its faculties as during the day we have been able to conclude that both sides are right but that neither is entirely so In the dream thoughts we found evidence of a highly complicated intellectual activity operating with almost all the resources of the psychic apparatus yet it cannot be denied that these dream thoughts have originated during the day and it is indispensable to assume that there is a sleeping state of the psychic life Thus even the doctrine of partial sleep received its due but we have found the characteristic feature of the sleeping state not in the disintegration of the psychic system of connections but in the special attitude adopted by the psychic system which is dominant during the day—the attitude of the wish to sleep The deflection from the outer world retains its significance for our view too though not the only factor at work it helps to make possible the regressive course of the dream representation The abandonment of voluntary guidance of the flow of ideas is incontestable but psychic life does not thereby become aimless for we have seen that upon relinquishment of the voluntary directing ideas involuntary ones take charge On the other hand we have not only recognized the loose associative connection of the dream but have brought a far greater area within the scope of this kind of connection than could have been suspected we have however found it merely an enforced substitute for another a correct and significant type of association To be sure we too have called the dream absurd but examples have shown us how wise the dream is when it simulates absurdity As regards the functions that have been attributed to the dream we are able to accept them all That the dream relieves the mind like a safety valve and that as Robert has put it all kinds of harmful material are rendered harmless by representation in the dream not only coincides exactly with our own theory of the twofold wish fulfilment in the dream but in its very wording becomes more intelligible for us than it is for Robert himself The free indulgence of the psyche in the play of its faculties is reproduced in our theory as the non interference of the preconscious activity with the dream The *return of the embryonal standpoint of psychic life in the dream* and Havelock Ellis s remark that the dream is *an archaic world of vast emotions and imperfect thoughts* appear to us as happy anticipations of our own exposition which asserts that *primitive* modes of operations that are suppressed during the day play a part in the formation of dreams We can fully identify ourselves with Sully s statement that our dreams bring back again our earlier and successively developed personalities our old ways of regarding things with impulses and modes of reaction which ruled us long ago and for us as for Delage the *suppressed* material becomes the mainspring of the dream

We have fully accepted the role that Scherner ascribes to the dream phantasy and his own interpretations but we have been obliged to transpose them as it were to another part of the problem It is not the dream that creates the phantasy but the activity of unconscious phantasy that plays the leading part in the formation of the dream thoughts We remain indebted to Scherner for directing us to the source of the dream thoughts but almost everything that he ascribes to the dream work is attributable to the activity of the unconscious during the day which instigates dreams no less than neurotic symptoms The dream work we had to separate from this activity as something quite different and far more closely controlled Finally we have by no means renounced the relation of the dream to psychic disturbances but have given it on new ground, a more solid foundation

Held together by the new features in our theory as by a superior unity we find the most varied and most contradictory conclusions of other writers fitting into our structure many of them are given a different turn but only a few of them are wholly rejected But our own structure is still unfinished For apart from the many obscure questions in which we have involved ourselves by our advance into the dark regions of psychology we are now it would seem embarrassed by a new contradiction On the one hand we have made it appear that the

or they form compromises for which we should never forgive our thought but which we frequently sanction in our action

These are some of the most conspicuous abnormal processes to which the dream thoughts which have previously been rationally formed are subjected in the course of the dream work. As the main feature of these processes we may see that the greatest importance is attached to rendering the cathecting energy mobile and *capable of discharge* the content and the intrinsic significance of the psychic elements to which these cathexes adhere become matters of secondary importance One might perhaps assume that condensation and compromise formation are effected only in the service of regression when the occasion arises for changing

fessor reveals the same processes of displacement and ... as ... the rest.

We cannot therefore avoid the conclusion that two kinds of essentially different psychic processes participate in dream formation one forms perfectly correct and fitting dream thoughts equivalent to the results of normal thinking while the other deals with these thoughts in a most confusing and ... it seems incorrect way The latter process we have already set apart in chapter VI as the dream work proper What can we say now as to the derivation of this psychic process

It would be impossible to answer this question here if we had not penetrated a considerable way into the psychology of the neuroses and especially of hysteria From this however we learn that the same ... correct psychic processes—as well as others not enumerated—control the production of hysterical symptoms. In hysteria too we find at first a series of perfectly correct and fitting thoughts, equivalent to our conscious ... es of whose existence in this form we can however learn nothing ... which we can only subsequently reconstruct. If they have forced their way anywhere to perception we discover from the analysis of the symptom formed that these normal thoughts have been subjected to abnormal treatment and *that by means of condensation and compromise formation through superficial associations which cover ... contradictions and eventually along the path of regression they have been conveyed to the symptom* In view of the complete identity

between the peculiarities of the dream work and those of the psychic activity which issues in psychoneurotic symptoms we shall feel justified in transferring to the dream the conclusions urged upon us by hysteria

From the theory of hysteria we borrow the proposition that *such an abnormal psychic elaboration of a normal train of thought takes place only when the latter has been used for the transference of an unconscious wish which dates from the infantile life and is in a state of repression* Complying with this proposition we have built up the theory of the dream on the assumption that the actuating dream wish invariably originates in the unconscious which as we have ourselves admitted cannot be

term so freely we shall be obliged to make a further addition to our psychological scaffolding

was constructed after the plan of a reflex apparatus motility in the first place as the path to changes within the body was the channel of discharge at its disposal. We then discussed the psychic results of experiences of gratification and were able at this point to introduce a second assumption namely that the accumulation of excitation—by processes that do not concern us here—is felt as pain and sets the apparatus in operation in order to bring about again a state of gratification, in *which the diminution of excitation is perceived* as pleasure Such a current in the apparatus issuing from pain and striving for pleasure we call

tion of pleasure and pain The first occurrence of wishing may well have taken the form of a hallucinatory cathexis of the memory of gratification But this hallucination unless it could be maintained to the point of exhaustion proved incapable of bringing about a cessation of the need, and consequently of securing the pleasure connected with gratification

Thus there was required a second activity—in our terminology the activity of a second system—which would not allow the memory

the neglected or suppressed train of thought is in a position to maintain itself although this reinforcement gives it no claim to access to consciousness We may say then that the hitherto preconscious train of thought *has been drawn into the unconscious*

Other constellations leading to dream formation might be as follows The preconscious train of thought might have been connected from the beginning with the unconscious wish and for that reason might have met with rejection by the dominating aim h

d by the *Pcs* All three cases have the same result there is established in the preconscious a train of thought which having been abandoned by the preconscious cathexis has acquired cathexis from the unconscious wish

From this point onward the train of thought is subjected to a series of transformations which we no longer recognize as normal psychic processes and which give a result that we find strange a psychopathological formation Let us now emphasize and bring together these transformations

1 The intensities of the individual ideas become capable of discharge in their entirety and pass from one idea to another so that individual ideas are formed which are endowed with great intensity Through the repeated occurrence of this process the intensity of an entire train of thought may ultimately be concentrated in a single conceptual unit This is the fact of *compression* or *condensation* with which we become acquainted when investigating the dream work It is condensation that is mainly responsible for the strange impression produced by dreams for we know of nothing analogous to it in the normal psychic life that is accessible to consciousness We get here too ideas which are of great psychic significance as nodal points or as end results of whole chains of thought but this value is not expressed by any character *actually manifest* for our internal perception what is represented in it is not in any way made more intensive In the process of condensation the whole set of psychic connections becomes transformed into the *intensity* of the idea content The situation is the same as when in the case of a book I italicize or print in heavy type any word to which I attach outstanding value for the understanding of the text In speech I should pronounce the same word loudly and deliberately and with emphasis The first simile points immediately to one of the examples which were given of the dream work (*trimethylamine* in the dream of Irma s injection) Historians of art call our attention to the fact that the most ancient sculptures known to history follow a similar principle in expressing the rank of the persons represented by the size of the statues. The king is made two or three times as tall as his retinue or his vanquished enemies But a work of art of the Roman period makes use of more subtle means to accomplish the same end The figure of the Emperor is placed in the centre erect and in his full height and special care is bestowed on the modelling of this figure his enemies are seen cowering at his feet but he is no longer made to seem a giant among dwarfs At the same time in the bowing of the subordinate to his superior even in our own day we have an echo of this ancient principle of representation

The direction followed by the condensations of the dream is prescribed on the one hand by the true preconscious relations of the dream thoughts and on the other hand by the attraction of the visual memories in the unconscious The success of the condensation work produces those intensities which are required for penetration to the perception system

2 By the free transference of intensities and in the service of the condensation *intermediary ideas*—compromises as it were—are formed (cf the numerous examples) This also is something unheard of in the normal movement of our ideas where what is of most importance is the selection and the retention of the right conceptual material On the other hand composite and compromise formations occur with extraordinary frequency when we are trying to find verbal expression for preconscious thoughts these are considered slips of the tongue

3 The ideas which transfer their intensities to one another are *very loosely connected* and are joined together by such forms of association as are disdained by our serious thinking and left to be exploited solely by wit In particular assonances and punning associations are treated as equal in value to any other associations

4 Contradictory thoughts do not try to eliminate one another but continue side by side and often combine to form condensation products *as though no contradiction existed*

cathexis to force its way to perception and thence to bind the psychic forces but would lead the excitation emanating from the need stimulus by a detour which by means of voluntary motility would ultimately so change the outer world as to permit the real perception of the gratifying object Thus far we have already elaborated the scheme of the psychic apparatus these two systems are the germ of what we set up in the fully developed apparatus as the *Ucs* and *Pcs*

To change the outer world appropriately by means of motility requires the accumulation of a large total of experiences in the memory systems as well as a manifold consolidation of the relations which are evoked in this memory material by various directing ideas We will now proceed further with our assumptions The activity of the second system groping in many directions tentatively sending forth cathexes and retracting them needs on the one hand full command over all memory material but on the other hand it would be a superfluous expenditure of energy were it to send along the individual thought paths large quantities of cathexis which would then flow away to no purpose and thus diminish the quantity needed for changing the outer world Out of a regard for purposiveness therefore I postulate that the second system succeeds in maintaining the greater part of the energic cathexes in a state of rest and in using only a small portion for its operations of displacement The mechanics of these processes is entirely unknown to me anyone who seriously wishes to follow up these ideas must address himself to the physical analogies and find some way of getting a picture of the sequence of motions which ensues on the excitation of the neurones Here I do no more than hold fast to the idea that the activity of the first ψ system aims at *the free outflow of the quantities of excitation* and that the second system by means of the cathexes emanating from it effects an *inhibition* of this outflow a transformation into dormant cathexis probably with a rise of potential I therefore assume that the course taken by any excitation under the control of the second system is bound to quite different mechanical conditions from those which obtain under the control of the first system After the second system has completed its work of experimental thought it removes the inhibition and damming up of the excitations and allows them to flow off into motility

An interesting train of thought now presents itself if we consider the relations of this inhibition of discharge by the second system to the process of regulation by the pain principle Let us now seek out the counterpart of the primary experience of gratification namely the *objective experience of fear* Let a perception stimulus act on the primitive apparatus and be the source of p n

Y

p

from the

cept this

peated (perhaps as a movement of flight) until the percept has again disappeared But in this case no tendency will remain to recathect the perception of the source of pain by hallucination or otherwise On the contrary there will be a tendency in the primary apparatus to turn away again from this painful memory image immediately if it is in any way awakened since the overflow of its excitation into perception would of course evoke (or more precisely begin to evoke) pain This turning away from a recollection which is merely a repetition of the former flight from perception is also facilitated by the fact that unlike the perception the recollection has not enough quality to arouse consciousness and thereby to attract fresh cathexis This effortless and regular turning away of the psychic process from the memory of anything that had once been painful gives us the prototype and the first example of *psychic repression* We all know how much of this turning away from the painful the tactics of the ostrich may still be shown as present even in the normal psychic life of adults

In obedience to the pain principle therefore the first ψ system is quite incapable of introducing anything unpleasant into the thought nexus The system cannot do anything but wish If this were to remain so the activity of thought of the second system which needs to have at its disposal all the memories stored up by experience would be obstructed But two paths are now open either the work of the second system frees itself completely from the pain principle and continues its course paying no heed to the pain attached to given memories or it contrives to cathect the memory of the pain in such a manner as to preclude the liberation of pain We can reject the first possibility as the pain principle also proves to act as a regulator of the cycle of excitation in the second system we are therefore thrown back upon the second possibility namely that this system cathects a memory in such a manner as to

w_h invariably originates in the unconscious I have already go e a step beyond the demon strable Nor will I inquire further into the na t re of the diff rence between the play of psy chic f rces in dream format on and in the for matio f hyst rical symptoms sinc there is missi here the eeded fuller knowledge of one of the tw things t be compared. But there is an ther po t which I regard as important and I will c nfess at once that t was only on ac count of this point that I entered upon all the discussio conc rning the two psychic systems th r modes of operation and the fact of re pres on. It d es ot greatly matt r whethe I ha e co cei ed the psych logical relations at 1su with approximate correctness or as is eas ly pos ble in such a difficult matter wrongly and mperfectly However our ews may chan e abo t the interpretation of the psych c cen rship or the c rrect and the abnormal elab-

effic cy or capacities The objection that no conclu io s ca be drawn about the dreams of healthy persons from my own dreams and from th se of my neurotic pat ents may be rejected without comment If then from the nature of the given phenomena we inf r the natur of their m t ve forces we find that the psychic mechanism utilized by the neuroses is not new ly-created by a mo b d disturbance that la s hold of the psychic life, but lies in readiness in the normal structure of our psychic appa ratus The two psychic systems the frontier censorship between them the inhib tion and ove la n of the one acti ity by the other the relations of both to consciousness—or whatever may take place of these co cepts on a juster interpretat on of the actual relations—all these belong to the normal structure of our psychic instrume t and the dream hows us one of the paths which lead to a knowled e of this struc ture If we wish to be conte t with a min mum of perfectly assured add t ons to our knowledge we shall say that th dream afford proof that *the suppressed material cont nues to exist even in the no mal person a d rema ns capable of p y chic a tivity* Dreams are one of the manifesta tions of this suppressed material theor t cally this i true in all cases and in tangible experi e ce t has been found tru in at lea t a great

perhaps endeavour to divert them and to guide them to superior aims In consequence of this retardation an extensive region of the memory material remains in fact inaccessible to preconscious cathexis

Now among these wish impulses originating in the infantile life indestructible and incapable of inhibition there are some the fulfilments of which have come to be in contradiction with the purposive ideas of our secondary thinking The fulfilment of these wishes would no longer produce an affect of pleasure but one of pain *and it is just this conversion of affect that constitutes the essence of what we call* repression In what manner and by what motive forces such a conversion can take place constitutes the problem of repression which we need here only to touch upon in passing It will suffice to note the fact that such a conversion of affect occurs in the course of development (one need only think of the emergence of disgust originally absent in infantile life) and that it is connected with the activity of the secondary system The memories from which the unconscious wish evokes a liberation of affect have never been accessible to the *Pcs* and for that reason this liberation cannot be inhibited It is precisely on account of this generation of affect that these ideas are not now accessible even by way of the preconscious thoughts to which they have transferred the energy of the wishes connected with them On the contrary the pain principle comes into play and causes the *Pcs* to turn away from these transference thoughts These latter are left to themselves are *repressed* and thus the existence of a store of infantile memories withdrawn from the beginning from the *Pcs* becomes the preliminary condition of repression

In the most favourable case the generation of pain terminates so soon as the cathexis is withdrawn from the transference thoughts in the *Pcs* and this result shows that the intervention of the pain principle is appropriate It is otherwise however if the repressed unconscious wish receives an organic reinforcement which it can put at the service of its transference thoughts and by which it can enable them to attempt to break through with their excitation even if the cathexis of the *Pcs* has been taken away from them A defensive struggle then ensues inasmuch as the *Pcs* reinforces the opposite to the repressed thoughts (counter cathexis) and the eventual outcome is that the transference thoughts (the carriers of the unconscious wish) break through in some form of compromise through symptom formation But from the moment that the repressed thoughts are powerfully cathected [illegible]

[illegible] motor discharge or if the way is clear at hallucinatory revival of the desired identity of perception We have already found empirically that the *incorrect* processes described are en[illegible]

[illegible] of the facts These *incorrect* processes are the *primary* processes of the psychic apparatus they occur wherever ideas abandoned by the preconscious cathexis are left to themselves and can become filled with the uninhibited energy which flows from the unconscious and strives for discharge There are further facts which go to show that the processes described as incorrect are not really falsifications of our normal procedure or defective thinking but the modes of operation of the psychic apparatus when freed from inhibition Thus we see that the process of the conveyance of the preconscious excitation to motility occurs in accordance with the same procedure and that in the linkage of preconscious ideas with words we may easily find manifested the same displacements and confusions (which we ascribe to inattention) Finally a proof of the increased work made necessary by the inhibition of these primary modes of procedure might be found in the fact that we achieve a *comical effect* a surplus to be discharged through *laughter if we allow these modes of thought to come to consciousness*

The theory of the psychoneuroses asserts with absolute certainty that it can only be sexual wish impulses from the infantile life which have undergone repression (affect conversion) during the developmental period of childhood which are capable of renewal at later periods of development (whether as a result of our sexual constitution which has of course grown out of an original bi sexuality or in consequence of unfavourable influences in our sexual life) and which therefore supply the motive power for all psychoneurotic symptom formation It is only by the introduction of these sexual forces that the gaps still demonstrable in the theory of repression can be filled Here I will leave it undecided whether the postulate of the sexual and infantile holds good for the theory of dreams as well I am not completing the latter because in assuming that the dream

consciousness is the nd spens ble qual ty of the psych c f his re pect f r the utterances of the philos phers is tul gr at en u h he may pe haps a um that he and they do not deal with th same thi and d not pursue th same cience. ment of new cleavages in its interior it can be explained *dynamically* by the strengthening and weakening of the components of the play of forces so many of the activities of which are covered up in normal functionin It might be shown el ewhere how the fact that the appa ratus is a combination of two instances also permits of a refinement of its normal function ing which would have been impossible to a single system

F *The Unconscious and Consciousness Reality*

If we look more closely we may observe that the psychological considerations examined in the foregoing chapter require us to assume not the existence of two systems near the motor end of the psychic apparatus but *two kinds of processes or courses taken by excitation* But this does not disturb us for we must always be ready to drop our auxiliary ideas when we think we are in a position to replace them by something which comes closer to the unknown reality Let us now try to correct certain views which may have taken a misconceived form as long as we regarded the two systems in the crudest and most obvious sense as two locali ties within the psychic apparatus—views which have left a precipitate in the terms *repression* and *penetration* Thus when we say that an unconscious thou ht strives for translation in to the preconscious in order subsequently to penetrate through to consciousness we do not mean that a second idea has to be formed in a new locality like a paraphrase as it were whilst the original persists by its side and sim ilarly when we speak of penetration into con sciousness we wish carefully to detach from this notion any idea of a change of locality When we say that a preconscious idea is re pressed and subsequently absorbed by the un conscious we might be tempted by these images borrowed from the idea of a struggle for a particular territory to assume that an arrangement is really broken up in the one psy chic locality and replaced by a new one in the other locality For these comparisons we will substitute a description which would seem to correspond more closely to the real state of affairs we will say that an energic cathexis is shifted to or withdrawn from a certain arra e ment so that the psychic formation falls under the domination of a given instance or is with drawn from it Here again we replace a topo graphical mode of representation by a dynamic one it is not the psychic formation that ap pears to us as the mobile element but its in nervation

Nevertheless I think it expedient and justi fiable to continue to use the illustrative idea of the two systems We shall avoid any abuse of this mode of representation if we remember that ideas thoughts and psychic formations in general must not in any case be localized in or ganic elements of the nervous sy tem but so to speak *between them* where resistances and as sociation tracks form the correlate correspond ing to them Everything that can become an object of internal perception is *virtual* like the image in the telescope produced by the cro in of li ht rays But we are justified in thinkin of the systems—which have nothin psychic in themselves and which never become acces ible to our psychic perception—as somethin simi lar to the lenses of the telescope which project the ima e If we continue this comparison we might say that the censorship between the two systems corresponds to the refraction of rays on passing into a new medium

Thus far we have developed our psychology on our own responsibility it is now time to turn and look at the doctrines prevailin in modern psychology and to examine the rela tion of these to our theories The problem of the unconscious in psychology is accordin to the forcible statement of Lipps le s *a* psycho lo ical problem than *the* problem of psychology As long as psychology dispo ed of this problem by the verbal explanation that the *psychic* is the *conscious* and that *unconscious psychic occurrences* are an obvious contradiction there was no possibility of a physician s observations of abnormal mental states being turned to any psychological account The physician and the philosopher can meet only when both acknowl edge that *unconscious psych c processes* is *the appropriate and justified expression for an es tablisl ed fact* The physician cannot but reject, with a shrug of his shoulders the assertion that

consciousness is the indispensable quality of the psyche. If his respect for the utterances of the philosophers is still great enough, he may perhaps assume that he and they do not deal with the same thing and do not pursue the same science. For a single intelligent observation of the psychic life of a neurotic, a single analysis of a dream must force upon him the unshakable conviction that the most complicated and the most accurate operations of thought, to which the name of psychic occurrences can surely not be refused, may take place without arousing consciousness. The physician, it is true, does not learn of these unconscious processes until they have produced an effect on consciousness which admits of communication or observation. But this effect on consciousness may show a psychic character which differs from the unconscious process, so that internal perception cannot possibly recognize in the first a substitute for the second. The physician must reserve himself the right to penetrate, *by a process of deduction, from the* effect on consciousness to the unconscious psychic process; he learns in this way that the effect on consciousness is only a remote psychic product of the unconscious process and that the latter has not become conscious as such, and has moreover existed and operated without in any way betraying itself to consciousness.

A return from the over-estimation of the property of consciousness is the indispensable preliminary to any genuine insight into the course of psychic events. As Lipps has said, the unconscious must be accepted as the general basis of the psychic life. *The unconscious is the* larger circle which includes the smaller circle of the conscious; everything conscious has a preliminary unconscious stage, whereas the unconscious can stop at this stage, and yet claim to be considered a full psychic function. The unconscious is the true psychic reality; *in its inner nature it is just as much unknown to us as the reality of the external world, and it is just as imperfectly communicated to us by the data of consciousness as is the external world by the reports of our sense-organs.*

We get rid of a series of dream problems which have claimed much attention from earlier writers on the subject when the old antithesis be

no longer to be attributed to dream ... but to unconscious thinking which is active also during the day. If the dream seems to make play with a symbolical representation of the body, as Scherner has said, we know that this is the work of certain unconscious phantasies which are probably under the sway of sexual impulses, and find expression not only in dreams but also in hysterical phobias and other symptoms. If the dream continues and completes mental work begun during the day and even brings valuable new ideas to light, we have only to *strip off the dream-disguise from this, as the* ... k

belongs to the same psychic forces as are responsible for all such achievements during the day. We are probably much too inclined to

learn rather that the most essential and *original part of their creations came to them* in the form of inspirations and offered itself to their awareness in an almost completed state. In other cases where there is a concerted effort of all the psychic forces there is nothing *strange in the fact that conscious activity* too lends its aid. But it is the much abused privilege of conscious activity to hide from us all other activities wherever it participates.

It hardly seems worth while to take up the historical significance of dreams as a separate theme. Where for instance a leader has been impelled by a dream to engage in a bold undertaking the success of which has had the effect of changing history, a new problem arises only so long as the dream is regarded as a mysterious power and contrasted with other more familiar psychic forces. The problem disappears as soon as we regard the dream *as a form of expression* for impulses to which a resistance was attached during the day whilst at night

[1] I am happy to be able to point to an author who has drawn from the study of dreams the same conclusions as regards the relation between conscious activity and unconscious processes.

Du Prel says: "The problem as to what is the psyche manifestly requires a preliminary inquiry as to whether the consciousness and the psyche are identical. But this preliminary question is answered in the negative by the dream, which shows that the concept of the psyche extends beyond that of consciousness, much as the gravitation of a star extends beyond its sphere of luminosity" (*Phil. d. Myst.*, p. 47).

"It is a truth which cannot be sufficiently emphasized that the concepts of consciousness and of the psyche are not co-extensive" (p. 306).

ment of new cleavages in its interior it can be explained *dynamically* by the strengthening and weakening of the components of the play of forces so many of the activities of which are covered up in normal functioning It might be shown elsewhere how the fact that the apparatus is a combination of two instances also permits of a refinement of its normal functioning which would have been impossible to a single system

F The Unconscious and Consciousness Reality

If we look more closely we may observe that the psychological considerations examined in the foregoing chapter require us to assume not the existence of two systems near the motor end of the psychic apparatus but *two kinds of processes or courses taken by excitation* But this does not disturb us for we must always be ready to drop our auxiliary ideas when we think we are in a position to replace them by something which comes closer to the unknown reality Let us now try to correct certain views which may have taken a misconceived form as long as we regarded the two systems in the crudest and most obvious sense as two localities within the psychic apparatus—views which have left a precipitate in the terms *repression* and *penetration* Thus when we say that an unconscious thought strives for translation into the preconscious in order subsequently to penetrate through to consciousness we do not mean that a second idea has to be formed in a new locality like a paraphrase as it were whilst the original persists by its side and similarly when we speak of penetration into consciousness we wish carefully to detach from this notion any idea of a change of locality When we say that a preconscious idea is repressed and subsequently absorbed by the unconscious we might be tempted by these images borrowed from the idea of a struggle for a particular territory to assume that an arrangement is really broken up in the one psychic locality and replaced by a new one in the other locality For these comparisons we will substitute a description which would seem to correspond more closely to the real state of affairs we will say that an energic cathexis is shifted to or withdrawn from a certain arrangement so that the psychic formation falls under the domination of a given instance or is withdrawn from it Here again we replace a topographical mode of representation by a dynamic one it is not the psychic formation that appears to us as the mobile element but its innervation

Nevertheless I think it expedient and justifiable to continue to use the illustrative idea of the two systems We shall avoid any abuse of this mode of representation if we remember that ideas thoughts and psychic formations in general must not in any case be localized in organic elements of the nervous system but so to speak *between them* where resistances and association tracks form the correlate corresponding to them Everything that can become an object of internal perception is *virtual* like the image in the telescope produced by the crossing of light rays But we are justified in thinking of the systems—which have nothing psychic in themselves and which never become accessible to our psychic perception—as something similar to the lenses of the telescope which project the image If we continue this comparison we might say that the censorship between the two systems corresponds to the refraction of rays on passing into a new medium

Thus far we have developed our psychology on our own responsibility it is now time to turn and look at the doctrines prevailing in modern psychology and to examine the relation of these to our theories The problem of the unconscious in psychology is according to the forcible statement of Lipps le s *a* psychological problem than *the* problem of psychology As long as psychology disposed of this problem by the verbal explanation that the *psychic is the conscious* and that *unconscious psychic occurrences* are an obvious contradiction there was no possibility of a physician s observations of abnormal mental states being turned to any psychological account The physician and the philosopher can meet only when both acknowledge that *unconscious psychic processes is the appropriate and justified expression for an established fact* The physician cannot but reject with a shrug of his shoulders the assertion that

[illegible]

In order to e dow them with qual ty they are as ociated in man with verbal memories the qual tat e residues of which suffice to draw upon them the attention of consciousness, wh ch in turn endows thought with a new mo-b le cathexis.

It is only on a d section of hysterical men tal processes that the ma fold nature of the problems of con ciousness becomes apparent. One then receives the mpress on that the tran s tion from the precon c ous to the consci us cathe s is associated with a ce sorsh p s mi lar to that between *Ucs* and *Pcs* Th s censor ship too be ins to act o ly when a certain qua t tati e l m t is reached so that thought form tions which are not ery i tense escape it. All po ble cases of detention from con sciousness and of penet tion into conscious-ness under certa n restrictions are inclu led w thin the range of psychoneurotic phenomena all po t to the int mate and twofold connection between the ce sorship and consciousne I shall co lude these psychological con d ra t ns with the record of two s ch occurrences

On the occa on of a consultation a few ears ago the patient was an intelligent looking girl with a simple unaffected manner She was strangely attired for whereas a woman s dress is usually ca ef lly thought out to the last pleat o e of he stockings was hanging down and two of the buttons of her blouse were un done She complained of pains in one of her legs and exposed her calf w thout being asked t d s Her chief c mplaint however was as f llow She had a feelin in her body *as tho gh someth g we e stuck g i o it wh ch mov d to and f o and shook her th o gh and thro gh* This sometimes seemed to make her whole body st ff On hearing th my colleague in con l tation looked at me the trouble was qu te ob-vi us to him T both of us t seemed pecul ar that this suggested nothi g to the pat ent s mothe though sh herself must repe tedly ha e been n the t tion d cribed by her child. A for th gi l he had n dea of the mport of he word r she w uld never ha e all wed them to pass h l ps Here the censor hip had been hoodwinked so successfully th t under the mask of an innocent complaint a phantasy wa admitted t co cious ess wh ch oth rwise would have remained in the precon sc ous

A oth exampl I began th psycho-alytic treatment of a boy fourtee wh was sufferi g from *t convulsi f* hyst rical omit ing headach etc by assuring him that after

they were able to draw reinforcement from deep lying sources of excitation But the great respect with which the ancient peoples regarded dreams is ba ed on a just piece of psychological divination It is a homage *paid to the unsub* dued and indestructible element in the human soul to the *demonic* pov er which furnishes the dream wish and which we have found again *in our unconscious*

It is not without purpose that I use the ex pression *in our unconscious* for what we so call *does not coincide with the unconscious of the* philosophers nor with the unconscious of Lipps As they use the term it merely means the opposite of the conscious That there exist not only conscious but also unconscious psy chic processes is the opinion at issue which is so hotly contested and so energetically defend ed Lipps enunciates the more comprehensive doctrine that everything psychic exists as un conscious but that some of it may exist al o as conscious But it is not to prove *this* doc trine that we have adduced the phenomena of dreams and hysterical symptom formation the observation of normal life alone suffices to es *tablish its correctness beyond a doubt* The nov el fact that we have learned from the analysis of psycho pathological formations and indeed from the first member of the group from dreams is that the unconscious—and hence all that is psychic—occurs as a function of two separate systems and that as such it occurs even in normal psychic *life There are conse* quently *two kinds of unconscious* which have not as yet been distinguished by psychologists Both are unconscious in the psychological sense but in our sense the first which we call *Ucs* is likewise *incapable of consciousness* whereas the second we call *Pcs* becau e its ex *citations* after the observance of certain rules are capable of reaching consciousness perhaps not before they have again undergone censor ship but nevertheless regardless of the *Ucs* sys tem The fact that in order to attain conscious ness the excitations must pass through an access to voluntary motility and has control of the emission of a mobile cathectic energy a portion of which is familiar to us as attention

We must also steer clear of the distinction between the *super conscious* and the *subcon scious* which has found such favour in the more recent literature on the psychoneuro es for just such a distinction seems to emphasize the equiv alence of what is psychic and what is conscio s.

What role is now left in our representation of things to the phenomenon of consciousness once so all powerful and over shadowing all else? None other than *that of a sense-organ for the perception of psychic qualities* Accord ing to the fundamental idea of our schematic attempt we can regard conscious perception only as the function proper to a special system for which the abbreviated designation *Cs* com mends itself This system we conceive *to be* similar in its mechanical characteristics to the perception system *P* and hence excitabl by qualities and incapable of retaining the trace of changes i e devoid of memory The psychic apparatus which with the sense-organ of the *P* systems is turned to the outer world is it elf the outer world for the sen e-organ of *Cs* whose teleological justification depends on this relationship We are here once more con fronted with the principle of the succession of instances which seems to dominate the struc ture of the apparatus The material of excita tion flows to the sense organ *Cs* from two sides *first from the P system* whose excitation qual itatively conditioned probably undergoes a new elaboration until it attains conscious percep tion and secondly from the interior of th apparatus itself whose quantitative processes are perceived as a qualitative series of pleasures and pains once they have reached conscious ness after undergoing certain changes

The philosophers who became aware that accurate and highly complicated thou ht struc tures are possible even without the co-operation of consciousness thus found it difficult to as cribe any function to consciousness it appeared to them a superfluous mirroring of the com pleted psychic process The analogy of our *Cs* system with the perception systems relieves us of this embarrassment We see that perception through our sense organs results in directing an attention cathexis to the paths along which the incoming sensory excitation diffuses it elf

by analogy in spatial terms We described the relations of the two systems to each other and to *consciousness* by saying that the system *Pcs* is like a screen between the system *Ucs* and consciousness The system *Pcs* not only bars access to consciousness but also controls the

Cf (p 79 bo e) th d e m (Σὰ Τύρος) of Alex ande the Great at th g of Tyre.

action. Indeed, the reason why they frequently do not encounter any psychic obstacle on their path is because the unconscious is certain of their meeting with resistances later. In any case it is instructive to learn something of the much-tilled soil from which our virtues proudly arise. For the complexity of human character, dynamically moved in all directions, very rarely accommodates itself to the arbitrament of a simple alternative, as our antiquated moral philosophy would have it.

And what of the value of dreams in regard to our knowledge of the future? That, of course, is quite out of the question. One would like to substitute the words: *in regard to our knowledge of the past*. For in every sense a dream has its origin in the past. The ancient belief that dreams reveal the future is not indeed entirely devoid of truth. By representing a wish as fulfilled the dream certainly leads us into the future; but this future, which the dreamer accepts as his present, has been shaped in the likeness of the past by the indestructible wish.

closing his eyes he would see pictures or that ideas would occur to him which he was to communicate to me He replied by describing pictures The last impression he had received before coming to me was revived visually in his memory He had been playing a game of checkers with his uncle and now he saw the checkerboard before him He commented on various positions that were favourable or un favourable on moves that were not safe to make He then saw a dagger lying on the check er board—an object belonging to his father but which his phantasy laid on the checker board Then a sickle was lying on the board a scythe was added and finally he saw the image of an old peasant mowing the grass in front of his father s house far away A few days later I discovered the meaning of this series of pictures Disagreeable family circumstances had made the boy excited and nervous Here was a case of a harsh irascible father who had lived unhappily with the boy s mother and whose educational methods consisted of threats he had divorced his gentle and deli cate wife and remarried one day he brought home a young woman as the boy s new mother The illness of the fourteen year old boy de veloped a few days later It was the suppressed rage against his father that had combined these images into intelligible allusions The material was furnished by a mytholo ical reminiscence The sickle was that with which Zeus castrated his father the scythe and the image of the peasant represented Kronos the violent old man who devours his children and upon whom Zeus wreaks his vengeance in so unfilial a man ner The father s marriage gave the boy an op portunity of returning the reproaches and threats which the child had once heard his father utter because he *played* with his genitals (the draught board the prohibited moves the dagger with which one could kill) We have here long impressed memories and their uncon cious derivatives which *under the guise of meaningless pictures* have slipped into con sciousness by the devious paths opened to them

If I were asked what is the theoretical value of the study of dreams I should reply that it lies in the additions to psychological knowledge and the beginnings of an understanding of the neuroses which we thereby obtain Who can foresee the importance a thorough knowledge of the structure and functions of the psychic apparatus may attain when even our present state of knowledge permits of successful thera peutic intervention in the curable forms of psy choneuroses? But it may be asked what of the practical value of this study in regard to a knowledge of the psyche and discovery of the hidden peculiarities of individual charac ter? Have not the unconscious impulses r vealed by dreams the value of real forces in the psychic life? Is the ethical significa ce of the uppressed wishes to be lightly disregarded, since just as they now create dreams they may some day create other things?

I do not feel justified in answerin these questions I have not followed up this aspect of the problem of dreams In any ca e how ever I believe that the Roman Emperor was in the wrong in ordering one of hi ubjects to be executed becau e the latter had dreamt that he had killed the Emperor He should first of all have endeavoured to discover the significa ce of the man s dreams most probably it was not what it seemed to be And even if a dream of a different content had actually had this trea sonable meanin it would still have been well to recall the words of Plato—that the virtuous man contents himself with dreamin of that which the wicked man does in actual life I am therefore of the opinion that dreams should be acquitted of evil Whether any *reality* is to be attributed to the unconscious wishes I cannot say Reality must of course be denied to all transitory and intermediate thou hts If we had before us the unconscious wishes brought to their final and truest expression we should still do well to remember that *psychic re lity* is a special form of existence which mu t not be confounded with *material reality* It eem therefore unnece sary that people hould re fuse to accept the responsibility for the im morality of their dreams With an appreciation of the mode of functioning of the psychic ap paratus and an insight into the relations be tween conscious and unconscious all that is ethically offensive in our dream life and the life of phantasy for the most part disappears.

What a dream has told us of our relations to the present (reality) we will then seek also in our consciousness and we must not be surprised if we discover that the monster we saw under the magnifying glass of the analysis is a tiny little infusorian (H Sachs)

For all practical purposes in judging human character a man s actions and conscious ex pressions of thought are in most cases sufficient. Actions above all de erve to be placed in the front rank for many impulses which penetrate into consciousness are neutrali ed by real forces in the psychic life before they find issue in

On Narcissism: an Introduction[1]

I

The word *narcissism* is taken from clinical terminology and was chosen by P. Näcke in 1899 to denote the attitude of a person who treats his own body in the same way as otherwise the body of a sexual object is treated; that is to say, he experiences sexual pleasure in gazing at, caressing and fondling his body, till complete gratification ensues upon these activities. Developed to this degree, narcissism has the significance of a perversion, which has absorbed the whole sexual life of the subject; consequently in dealing with it we may expect to meet with phenomena similar to those for which we look in the study of all perversions.

Now those engaged in psycho-analytic observation were struck by the fact that isolated features of the narcissist attitude are found

a pla in th egular s xual devel pme t of human be n s Difficulti s in psycho nal t c wo k upo u ot cs led to the sam uppos ti for t seemed as though th s ki d of cis t att tude in th m was on of th f ctors limiting th usc ptibil ty to infl ence Nar ci sm in this se se would ot be a perversion, b t the libidinal c mplement to the ego m of the instinct of self pr ervati me sure of which may j tifiably be ttributed to every livi creature

A pre ing m t f ccupying oursel es with th pt f prim ry and ormal na issism rose when the attempt w made t bri g our knowledge of dem ti pra cox (Kraepelin) o schiz ph (Bleul r) into line with the hypoth po which the lib do th ry is b sed S ch patient wh m I propo e t t rm *par phrem* display tw fu dam tal characteri t c they uffer f m m gal mania and they ha e withdrawn their int rest from the external wo ld (people and th ngs) In consequence of this latter change in them they are inaccessible to the influence of psycho-analysis and cannot be cured by our endeavours But this turning away of the paraphrenic from the outer world needs to be more precisely characterized A patient s suffering from hysteria or obsessional neurosis has also as far as the influence of his illness goes abandoned his relation to reality But analysis shows that he has by no means broken off his erotic relations to persons and things He still retains them in phantasy i e he has the one hand substituted for actual objects imaginary objects founded on memories or has blended the two

It is otherwise with the paraphrenic. He seems really to have withdrawn his libido from persons and things in the outer world without replacing them by others in his phantasy When this does happen the process seems to be a secondary one part of an effort towards recovery designed to lead the libido back towards object.

The question arises What is the fate of the libido when withdrawn from external objects in schizophrenia? The megalomania characteristic of the e c d ti s affords a clue here It has d btl ss come i t being t the expense of the object libido The libido withdrawn from the outer world has been directed on to the ego giving rise to a state which we may call *narcissism* But the megalomania itself is no ew phe ome the c ntrary it as we kn w an exaggeration a d plain manifestation of a c dition which had already existed previously This leads us to the conclusion that the narcissism which arises when libidinal cathexes are called in away from external objects must be conceived of as a secondary form

the cop n of the whole structure and they can be repl ced a d d carded w tho t damaging it. Th same thing is happening i ou day in the science of physics the fundam ntal notio s of whi h as reg rds matt centres f force at tracti n etc are sca cely les d batable than the c rrespo ding ideas in psycho-analysis.

The alue of the concepts *ego-l bido* and *bj t-l bi o* is that the are deri ed from the tudy of the essential characteristics f neu rotic and psychotic processe The differentia t o of the lib do into that which is proper to the ego and that which attaches itself to b-jects is a necessary exten on f an original hypothesis whi h d scriminated between ego- n tincts and sexual in ti cts At any rate anal is of the pure t ansf ence n uroses (hysteria and the obsessi nal eurosis) compelled me so t di criminate and I only know that all at tempts t ccount for these phenomena by ther means ha e been c mpl tely unsucces ful.

In the complete ab e f any theory of the instincts whi h would help us to find ou be r ings w ma be permitted, o rather it is in cumbent upon us in th first place to wo k out an hypothes to its logical co lu ion until t e the fails r becomes confirmed. The e are va ous points in f ou of the hypothes of a prim rdial differentia on between sexual in tincts and oth inst ncts ego-in ti cts be-sides the usefulness f such an assumption in the analysis of th transference ne oses. I ad mit that this latte consid ration alone would t be d cis e f r t might be a question of an indiff e t energy operatin n the m d whi h w c verted nto libido only by the ct of object-cathexis But in the first place this differe tiati of concepts correspo ds t the dist cti n between hunge a d love so wid ly curre t And i th seco d pl c the e are b logical co s d rat on n ts fa The individual does actu lly carry a d bl ex istence one designed t serve his wn pur poses and an th r a link in a ham in which he serves ainst t any rat witho t any v lition of hi own. The d dual hims lf re gards sexuality as f his wn ends while from anoth r point f ew h is only an p-pend ge t his germ pia m, t whi h he l nds hi erg taking i return hi toll f pleasure —th m rtal h le f a (po bly) imm rtal s bstance—like th inherit f an e tailed property wh nly the temporary hold r of an estate which surv ves him The d ff re t tion of th sexual in t cts from th ego-in stincts w uld simply reflect this double func tion of the indi dual Thirdly we must recollect that all our pro is onal id as in psychology will some day be based on an organ c substructure Th s makes it probable that special ubstances and special chem cal processes control the op-erat on of sexual ty and provide for the con tinuat n of the individual l e in that of the species We take this probab li y into account when we sub t tute pecial forces in the mind for special ch m cal sub ta ces.

Just because I try in general to keep apart from psych logy e erythin that is no strictly within its scope even b logical thou ht I wi h at th s poi t expres ly to dm t that the hypothesis of separate ego-in ti cts and sexual instincts (that is to say the l b d theory) rests scarcely at all upon a psychological basis but is es enti lly supported upon the facts of bi ology So I shall also be consiste t enough to drop this hypothesis if psycho analytic work it lf hould sugge t as more valuable another h poth s s about the instincts So far this has n t happened It may then be that—when we penetrate deepest and furthest—sexual en ergy the libido will be found to be only the product of a differen iation in the energy at work generally i the m d But such a state-ment is of no importance It has reference to matt rs so remote from the prol lems f our observat n a d so empty of a ailab e knowl edg that to d spute it is as idle as to affirm t it is pos bl that this primordial identity has as little to do with ou analytical i terests as the primord al kin h p of all human races has t do with the p oof of kin hip with a testato requ red by the Probate Court All these speculations lead nowhere ince we can n t wa for a other science to present us with a theory of the in tincts ready made it is f r m re to th purpose that we hould try to see what li ht may be thrown upon this bas c problem of b ology by a synthesis of psycho-l gical phenomena Let us be fully aware of the pos bi ity of rror but do t l t us be de t rred f om carrying i ts logical co clus on th h pothesis w f rst dopted of an ant thesis bet een ego-instincts and sexual in tincts (an hypothes s to which we were mpelled by analy s f the transfe ence neuroses) and so from seeing whether t turns out to be co tent and fruitful and whether t may be appl ed to oth r aff ctions al o e.g to schizophrenia

Of course it would be a ery diff f it w re ready th la

superimposed upon a primary one that is ob scured by manifold influences

Let me expressly state that I am not attempt ing here to explain or penetrate further into the problem of schizophrenia but am merely putting together what has been said elsewhere in order that I may ju tify this introduction of the concept of narcissism

This development of the libido theory—in my opinion a legitimate development—receives reinforcement from a third quarter namely from the observations we make and the concep tions we form of the mental life of primitive peoples and of children In the former we find characteristics which if they occurred singly might be put down to megalomania an over estimation of the power of wishes and mental processes the *omnipotence of thoughts* a be lief in the magical virtue of words and a method of dealing with the outer world—the art of *magic*—which appears to be a logical ap plication of these grandiose premises In the child of our own day whose development is much more obscure to us we expect a perfectly analogous attitude towards the external world Thus we form a conception of an original libidi nal cathexis of the ego part of which cathexis is later yielded up to objects but which funda mentally persists and is related to the object cathexes much as the body of a protoplasmic animalcule is related to the pseudopodia which it puts out In our researches taking as they did neurotic symptoms for their starting point this part of the disposition of the libido neces sarily remained hidden from us at the out et We were struck only by the emanations from this libido—the object cathexes which can be put forth and drawn back a ain We perceive also broadly speaking a certain reciprocity be tween ego libido and object libido The more that is absorbed by the one the more impover ished does the other become The highest form of development of which object libido is capa ble is seen in the state of being in love when the subject seems to yield up his whole per sonality in favor of object cathexis while we have the opposite condition in the paranoiac s phantasy (or self perception) of the *end of the world* Finally with reference to the dif ferentiation of the energies operating in the mind we infer that at first in the narcissistic state they exist side by side and that our analy sis is not a fine enou h instrument to dis tinguish them only where there is object-cathexis is it possible to di criminate a sexual energy—the libido—from an energy pertaining to the ego instincts

Before going any further I must touch on two questions which lead us to the heart of the difficulties of our subject In the first place what is the relation of the narcissism of which we are now speaking to auto eroti m which we have described as an early state of the libi do? And secondly if we concede to the ego a primary cathexis of libido why is there any necessity for further distinguishing a sexual libido from a non sexual energy pertaining to the ego instincts? Would not the assumption of a uniform mental energy save us all the diffi culties of differentiating the energy of the ego instincts from e o libido and ego libido from object libido? On the first point I would com ment as follows it is impossible to uppose that a unity comparable to the ego can exist in the individual from the very start the ego has to develop But the auto-erotic instincts are primordial so there must be something added to auto erotism—some new operation in the mind—in order that narcissism may come into being

To be required to give a definite answer to the second question must occasion perceptible uneasiness in every psycho analyst One dis likes the thought of abandoning observation for barren theoretical discussions but all the same we must not shirk an attempt at explanation. Conceptions such as that of an ego libido an energy pertainin to the ego instincts and so on are certainly ne ther very easy to grasp nor is their content sufficiently rich a speculative theory of the e relations of which we are speak ing would in the first place require as its basis a sharply defined concept But I am of the opinion that that is just the difference between a speculative theory and a science founded upon const uctions arrived at empirically The latter will not begrudge to speculation its privilege of a smooth logically unassailable structure but will itself be gladly content with nebulous scarcely imaginable conceptions which it hopes to apprehend more clearly in the course of its d velopment or which it is even prepared to replace by othe s For these ideas are not the basis of the science upon which everything rests that on the contrary is observation alone They are not the foundation stone but

his jaw-tooth's chink hole Here libido and ego-interest share the same fate and have once more become indistinguishable from each other The familiar egoism of the sick person covers them both. We find it so natural because we are certain that in the same situation we should behave in just the same way The way in which the readiness to love however great is banished by bodily ailment and suddenly replaced by complete indifference is a theme which has been sufficiently exploited by comic writers

The condition of *sleep* like illness implies a narcissistic withdrawal of the libido away from its attachments back to the subject's own person, or more precisely to the single desire for sleep The egoism of dreams fits in very well in this connection. In both states we have if nothing else examples of changes in the distribution of the libido which are consequent upon change in the ego

Hypochondria like organic disease manifests itself in distressing and painful bodily sensations and also concurs with organic disease in its effect upon the distribution of the libido The hypochondriac withdraws both interest and libido—the latter specially markedly —from the object of the outer world and concentrates both upon the organ which engages his attention. A difference between hypochondria and organic disease now becomes evident in the latter the distressing sensations are based upon demonstrable organic changes in the former this is not so But it would be entirely in keeping with our general conception of the processes of neurosis if we decided to say that hypochondria must be right organic ch... Now m

re not lacking in the other neuroses I have said on a former occasion that I am inclined to class hypochondria with neurasthenia and anxiety neurosis as a third 'actual' neurosis Probably it would not be going too far to put it in this way that in the other neuroses too there is regularly present some small admixture of hypochondria Perhaps we have the best example of this in the anxiety neurosis and in the hysteria superimposed upon it. Now the familiar prototype of an organ sensitive to pain somehow changed and yet not diseased in the ordinary sense is that of the genital organ in a state of excitation. It becomes congested with blood swollen moist and is the seat of manifold sensations If we apply to that activity of a given bodily area which consists in conveying sexually exciting stimuli to the mind the term *erotogenicity* and if we reflect that the conclusions of our theory of sexuality have long accustomed us to the notion that certain other areas of the body—the *erotogenic* zones —may act as substitutes for the genitals and behave analogously to them we then have only one step further to venture here We can make up our minds to regard erotogenicity as a property common to all organs and are then justified in speaking of an increase or decrease in the degree of it in a given part of the body It is possible that for every such change in the erotogenicity of the organs there is a parallel change in the libidinal cathexis in the ego In such factors may lie the explanation of what is at the bottom of hypochondria and what it is that can have upon the distribution of the libido the same effect as actual organic disease

We see that if we follow out this line of thought, we encounter the problem not only of hypochondria but of the other *actual neuroses* —neurasthenia and anxiety neurosis. Let us therefore stop at this point. It is not within the scope of a purely psychological inquiry to penetrate so far behind the frontiers of physiological research. Let us only mention that from this point of view we may surmise that the relation of hypochondria to paraphrenia is similar to that of the other actual neuroses to hysteria and the obsessional neurosis which is as much as to say that it is dependent on the ego-libido as the others are on the object libido and that hypochondriacal anxiety emanating from the ego-libido is the counterpart to neurotic anxiety Further since we are already familiar with the idea that the mechanism of disease and symptom formation in the transference neuroses the passage from introversion to regression, is to be connected with damming up of the object libido we may come to closer quarters with the conception of damming-up of the ego-libido also and may bring this conception into relation with the problems of hypochondria and paraphrenia.

Of course curiosity will here suggest the question why such damming up of libido in the ego should be experienced as "painful. There I shall content myself with the answer that *pain* is in general the expression of in

maintained by C G Jun and so I have been obliged to enter upon this last disquisition which I would ladly have been spared I should have preferred without any discussion of the premises to follow out the course embarked upon in the analysis of the Schreber case But Jun s as ertion is to say the least of it premature The grounds he gives for it are scanty At the outset he quotes me as saying that I my elf have been obli ed owing to the difficulties of the Schreber analysis to extend the conception of the libido i e to give up its exual content and to identify libido with psychic *interest* in general Ferenczi in an exhaustive critici m of Jung s work has already said all that is necessary in correction of this erroneous interpretation I can only corroborate this critic and repeat that I have never thus retracted the libido theory Another argument of Jung s namely that we must not assume that the loss of the normal function of appreciating reality can be brought about only by the withdrawal of the libido is no argument but a dictum It begs the question it anticipates the decision and waives discussion for whether and how this is po sible is just what has to be investigated In his next large work Jung just misses the solution which I had long since indicated At the same time there is this to be taken into consideration a point to which Freud refers in his work on the Schreber case that the introversion of the *libido sexualis* leads to a cathexis *of the ego* and that possibly *it is* this that produces the effect of a loss of reality It is indeed a tempting possibility to explain the psychology of the loss of reality *in* this fashion But Jung discusses this possibility very little further A few pages later he dismisses it with the remark that from this conditioning factor would result not dementia praecox but the psychology of an ascetic anchorite How little this inept comparison can help us to a conclusion may be learnt from the reflection that an anchorite who tries to erase every trace of sexual interest (but only in the popular sense of the word *sexual)* does not even necessarily di play any patho enic disposition of the libido He may have turned away his interest from human beings entirely and yet may have sublimated it to a heightened interest in the divine in nature or in the animal kin dom without his libido havin undergone introversion to his phantasies or regression to his e o This comparison would eem to rule out in advance the pos ibility of differentiating between interest emanatin fro erotic or that from other ources Further when we remember that the re earches of the Swiss school however meritorious have elucidated only two features in the picture of dementia praecox—the existence of complexes common to healthy and neurotic persons alike, and the similarity of the phantasy formations of that disea e to popular myths—but have not been able to throw any further li ht on the patho enic mechanism we may repudiate Jung s assertion that the libido theory has broken down in the attempt to understand dementia praecox and is therefore rendered invalid *for the other neuroses also*

II

*It seems to me that certain peculiar difficul*ties lie in the way of a direct study of narcissism Our chief means of access to an under*standing of this condition* will probably remain the analysis of paraphrenics As the transference neuroses have enabled us to trace the libidinal *instinctual* impulses so dementia praecox and paranoia will give us insi ht into the psychology of the e o Once more in order to arrive at what is normal and apparently so simple we shall have to study the pathological with its distortions and exag erations At the same time there are other sources from which we may derive a knowled e of narcissism which I will now mention in their order—namely the study of organic disease of hypochondria and of love between the sexes

In estimating the influence of organic di ease upon the distribution of the libido I follow a su gestion of S Ferenczi s which he made to me in conversation It is universally known and seems to us a matter of course that a person sufferin organic pain and di comf

i t from his love objects so long as he suffers he ceases to love The banality of this fact is no reason why we should be deterred from translating it into terms of the libido-theory We should then say the sick man withdraws his libidinal cathexes back upon his own ego and sends them forth again when he recovers Concentrated is his soul says W Busch of the poet suffering from toothache in

creased tension and thus a *quantity* of the material event is here as elsewhere transformed into the *quality* of pain in the mind nevertheless it may be not the absolute amount of the physical process which is decisive for the development of pain but rather a certain function of this absolute amount At this point we may even venture to touch on the question whence does that necessity arise that urges our mental life to pass on beyond the limits of narcissism and to attach the libido to objects? The answer which would follow from our line of thought would once more be that we are so impelled when the cathexis of the ego with libido exceeds a certain degree A strong egoism is a protection against disease but in the last resort we must begin to love in order that we may not fall ill and must fall ill if in consequence of frustration we cannot love Somewhat after this fashion does Heine conceive of the psychogenesis of the Creation

Krankhe t ist wohl der let te Grund
Des gan en Schopferd angs ge esen
E schaffend konnte ich genesen
Erschaffend wurde ich gesund

We have recognized our mental apparatus above all as a device for mastering excitations which would otherwise be felt as unpleasant or would have pathogenic effects The working over of stimuli in the mind accomplishes wonders for the internal discharge of excitations which are incapable of direct discharge outwards or for which such a discharge is for the moment undesirable Now it is in the first instance a matter of indifference whether the objects of this internal process of working over are real or imaginary The difference does not appear till later when the turning of the libido towards unreal objects (introversion) has led to a damming up The megalomania of paraphrenics permits a similar internal working over of the libido which has returned to the ego to be made perhaps it is only when this process fails that the damming up of the libido in the ego becomes patho enic and starts the process of recovery which impresses us as being the disease itself

I shall try here to penetrate a little further into the mechanism of paraphrenia and to put together those conceptions which today seem to me worthy of consideration The difference between paraphrenic affections and the transference neuroses appears to me to lie in the circumstance that in the former the libido that is liberated by frustration does not remain attached to objects in phantasy but returns to the ego the megalomania then represents the mastery of this volume of libido and thus corresponds with the introversion on to the phantasy-creations that is found in the transference neuroses the hypochondria of paraphrenia which is homologous to the anxiety of the transference neuroses arises from a failure of this effort in the mental apparatus We know that the anxiety of the neuroses can be relieved by further mental working over e g by conversion reaction formation or defence-formation (phobia) The corresponding process in paraphrenics is the effort towards recovery to which the striking phenomena of the disease are due Since frequently if not usually an only partial detachment of the libido from objects accompanies paraphrenia we can distinguish in the clinical picture three groups of phenomena (1) those representin such remains as there may be of a normal state or of neurosis (phenomena of a residual nature) (2) those representing the morbid process (the detachment of the libido from its objects and, further megalomania hypochondria affective disturbance and every kind of regression) (3) those representing an attempt at recovery In (3) the libido is once more attached to objects after the manner of an hysteria (in dementia praecox or paraphrenia proper) or of an obsessional neurosis (in paranoia) This fresh libidinal cathexis takes place from another level and under other conditions than the primary one The difference between the transference neurosis arising in this way and the corresponding formations where the ego is normal would afford us the deepest insight into the structure of our mental apparatus

A third way in which we may study narcissism is by observing the behaviour of human beings in love with its manifold differentiations in man and woman In much the same way as the object libido at first concealed from us the ego libido so in considering the object choice of the child (and the adolescent) we first noticed that the sources from which he takes his sexual objects are his experiences of gratification The first auto-erotic sexual gratifications are experienced in connection with vital functions in the service of self preservation The sexual instincts are at the outset supported upon the ego instincts only later do they be

tion of neurosis and also of character and which he conceives of as having its origin, not in a narcissistic and therefore still libidinal, trend, but in a social valuation. Psycho-analytic research has, from the very beginning, recognized the existence and significance of the 'masculine protest' but has always regarded it, in opposition to Adler, as narcissistic in nature and derived from the castration complex. It appertains to the formation of character in the genesis of which it enters along with many other factors and it is completely inadequate to explain the problems of the neuroses in which Adler will take account of nothing but the manner in which they serve the interests of the ego. I find it quite impossible to base the genesis of neurosis upon so narrow a foundation as the castration complex, however pre-eminent a part this may play in men amongst the resistances to the cure of a neurosis. Lastly, I know also of cases of neurosis in which the masculine protest or in our sense the castration complex, plays no pathogenic part, and does not appear at all.

Observation of normal adults shows that their former megalomania has been subdued and that the mental characteristics from which we inferred their infantile narcissism have vanished. What has become of the ego-libido? Are we to assume that the whole of it has passed over into object-cathexes? Such a possibility is plainly contrary to the whole trend of our argument; but in the psychology of repression we may find a clue to another *answer to the question.*

We have learnt that libidinal impulses are fated to undergo pathogenic repression if they come into conflict with the subject's cultural and ethical ideas. By this we do not ever mean that the individual in question has a merely intellectual knowledge of the existence of these ideas; we always mean that he recognizes them as constituting a standard for himself and acknowledges the claims they make on him. Repression, as we have said, proceeds from the ego; we might say with greater precision, from the self-respect of the ego. The very impressions, experiences, impulses and desires that one man indulges or at least elaborates consciously will be rejected with the utmost indignation by another, or stifled even before they enter consciousness. The difference between the two, however—and here we have the conditioning factor in repression—can easily be expressed in terms of the libido-theory. We may say that the one man has set up an *ideal* in himself by which he measures his actual ego, while the other is without this formation of an ideal. From the point of view of the ego this formation of an ideal would be the condition of repression.

To this ideal ego is now directed the self-love which the real ego enjoyed in childhood. The narcissism seems to be now displaced on to this new ideal ego, which, like the infantile ego, deems itself the possessor of all perfections. As always where the libido is concerned, here again man has shown himself incapable of giving up a gratification he has once enjoyed. He is not willing to forego his narcissistic per-

[illegible]

wrested from him in the new form of an ego-ideal. That which he projects ahead of him as his ideal is merely his substitute for the lost narcissism of his childhood—the time when he was his own ideal.

This suggests that we should examine the relation between this forming of ideals and sublimation. Sublimation is a process that concerns the object-libido and consists in the instinct's directing itself towards an aim other than, and remote from, that of sexual gratification; in this process the accent falls upon the deflection from the sexual aim. Idealization is a process that concerns the *object*; by it that object, without any alteration in its nature, is aggrandized and exalted in the mind. I[illegible]

is a process that concerns the instinct and idealization one that concerns the object, the two concepts are to be distinguished one from the other.

The formation of the ego-ideal is often confounded with sublimation, to the detriment of clear comprehension. A man who has exchanged his narcissism for the worship of a high ego-ideal has not *necessarily* on that account succeeded in sublimating his libidinal instincts. It is true that the ego-ideal requires such sublimation, but it cannot enforce it; sublimation remains a special process which may be prompted by the ideal but the execution of which is entirely independent of any such incitement. It is just in neurotics that we find the highest degrees of tension between the development of their ego-ideal and the measure

Even for women whose attitude towards the man remains cool and narcissistic there is a way which leads to complete object love In the child to whom they give birth a part of their own body comes to them as an object other than themselves upon which they can lavish out of their narcissism complete object love Other women again do not need to wait for a child in order to take the step in development from (secondary) narcissism to object love Before puberty they have had feelings of a likeness to men and have developed to some extent on masculine lines after this tendency has been cut short when feminine maturity is reached they still retain the capacity of longing for a masculine ideal which is really a survival of the boyish nature that they themselves once owned

We may conclude these suggestions with a short survey of the paths leading to object choice

A person may love

(1) According to the narcissistic type
- (*a*) What he is himself (actually himself)
- (*b*) What he once was
- (*c*) What he would like to be
- (*d*) Someone who was once part of himself

(2) According to the anaclitic type
- (*a*) The woman who tends
- (*b*) The man who protects

and those substitutes which succeed them one after another The justification for inserting case (*c*) of the first type has yet to be demonstrated later on in our discussion

The significance of narcissistic object choice for homosexuality in men must be appraised in another connection

The primary narcissism of the child assumed by us which forms one of the hypotheses in our theories of the libido is less easy to grasp by direct observation than to confirm by deduction from another consideration If we look at the attitude of fond parents towards their children we cannot but perceive it as a revival and reproduction of their own long since abandoned narcissism Their feeling as is well known is characterized by over estimation that sure indication of a narcissistic feature in object choice which we have already appreciated Thus they are impelled to ascribe to the child all manner of perfections which sober observation would not confirm to gloss over and forget all his shortcomings—a tendency with which indeed the denial of childish sexuality is connected Moreover they are inclined to suspend in the child s favour the operation of all those cultural acquirements which their own narcissism has been forced to respect, and to renew in his person the claims for privileges which were long ago given up by themselves The child shall have things better than his parents he shall not be subject to the necessities which they have recognized as dominating life Illness death renunciation of enjoyment, restrictions on his own will are not to touch him the laws of nature like those of society are to be abrogated in his favour he is really to be the centre and heart of creation His Majesty the Baby as once we fancied ourselves to be He is to fulfil those dreams and wishes of his parents which they never carried out to become a great man and a hero in his father s stead or to marry a prince as a tardy compensation to the mother At the weakest point of all in the narcissistic position the immortality of the ego which is so relentlessly assailed by reality security is achieved by fleeing to the child Parental love which is so touching and at bottom so childish is nothing but parental narcissism born again and transformed though it be into object love it reveals its former character infallibly

III

The disturbances to which the original narcissism of the child is exposed the reactions with which he seeks to protect himself from them the paths into which he is thereby forced—these are themes which I shall leave on one side as an important field for work which still awaits exploration the most important of these matters however can be isolated from the rest and as the *castration complex* (in the boy anxiety concerning the penis in the girl envy of the penis) be treated in connection with the effect of early sexual intimidation Elsewhere psycho analytic research leads us to vicissitudes undergone by the libidinal instincts in which they are isolated from and in opposition to the ego instincts but where the castration complex is in question our researches permit us to infer the existence of an epoch and a mental state in which the two groups of instincts are acting in harmony with each other inseparably blent as narcissistic interests It is from this state of things that A Adler has derived his conception of the *masculine protest* which he has exalted almost to the position of the sole motive power concerned in the forma

strated that self-observation—in the sense of the paranoiac's delusion of being watched—plays a part in dream-formation. This part is not invariable; probably I overlooked it because it does not appear in my own dreams to any great extent; in persons who are gifted philosophically and therefore accustomed to introspection, it may become very clear.

We may here recall our discovery that dream-formation takes place under the sway of a censorship which compels distortion of the dream-thoughts. We did not picture this censorship as a special force, an entity, but we chose the term to denote a particular aspect of the repressive tendencies which control the ego, namely, their attitude towards the dream-thoughts. Penetrating further into the structure of the ego, we may recognize the dream-censor again in the ego-ideal and in the dynamic utterances of conscience. If this censor is to some extent on the alert even during sleep, we can understand that the necessary condition of its activity—self-observation and self-criticism—should contribute to the dream content some such thoughts as these: "Now he is too sleepy to think"; "now he is waking up."[1]

At this point we may enter upon a discussion of the self-regarding attitude in normal persons and in neurotics.

First of all, the feeling of self-regard appears to us a measure of the ego; what various components go to make up that measure is irrelevant. Everything we possess or achieve, every remnant of the primitive feeling of omnipotence that experience has corroborated, helps to exalt the self-regard.

Applying our distinction between sexual and ego-instincts, we must recognize that the self-regard has a very intimate connection with the narcissistic libido. Here we are supported by two fundamental facts: that in paraphrenics the self-regard is exalted, while in the transference neuroses it is abased; and that where the erotic life is concerned, not being loved lowers the self-regarding feelings, while being loved raises them. We have stated that to be loved is the aim and the satisfaction in a narcissistic object-choice.

Further, it is easy to observe that libidinal object-cathexis does not raise the self-regard. The effect of the dependence upon the loved object is to lower that feeling: the lover is humble. He who loves has, so to speak, forfeited a part of his narcissism, which can only be replaced by his being loved. In all these respects the self-regarding feelings seem to remain in a relation to the narcissistic element in the erotic life.

The realization of impotence, of one's own inability to love in consequence of mental or physical disorder, has an exceedingly lowering effect upon the self-regard. Here, as I judge, we shall find one of the sources of the feelings of inferiority of which patients suffering from the transference neuroses so readily complain to us. The main source of these feelings is, however, the impoverishment of the ego, due to the withdrawal from it of extraordinarily large libidinal cathexes—due, that is to say, to the injury sustained by the ego through the sexual trends which are no longer subject to control.

A. Adler is right in maintaining that a person's realization of organic inferiorities in himself acts as a spur upon an active mental life and produces by way of over-compensation a higher degree of ability. But it would be altogether an exaggeration if, following this lead of Adler's, we tried to prove that every f[illegible]

instances of excellent achievements springing from superior organic endowment. In the aetiology of neurosis, organic inferiority and imperfect development play an insignificant part, much the same as that played by actual perceptual material in the formation of dreams. The neurosis makes use of such inferiorities as pretext, just as it does of all other suitable factors. So surely as we credit the assertion of one neurotic patient that it was inevitable that she should fall ill, since she is ugly, deformed, or lacking in charm and so no one could love her, the very next neurotic will convince us of our error, for she remains the victim of her neurosis and her aversion to sexuality, although she seems to be desirable, and indeed more desired than the average woman. The majority of hysterical women are among the attractive and even beautiful representatives of their sex, while, on the other hand, the frequency of ugliness, organic maladies and defects in the lower classes of society does not increase the incidence of neurotic illness amongst them.

The relations existing between self-regard and erotism (libidinal object-cathexes) may be

[1] I cannot here determine whether the differentiation of the censorial function from the rest of the ego is capable of forming the basis of the philosophic distinction between consciousness and self-consciousness.

of their sublimation of primitive libidinal instincts and in general it is far harder to convince the idealist of the inexpediency of the hiding place found by his libido than the plain man whose demands in this respect are only moderate Further the formation of an ego ideal and sublimation are quite differently related to the causation of neurosis As we have learnt the formation of the ideal increases the demands of the ego and is the most powerful factor favouring repression sublimation is a way out a way by which the claims of the ego can be met without involving repression

It would not surprise us if we were to find a special institution in the mind which performs the task of seeing that narcissistic gratification is secured from the ego ideal and that with this end in view it constantly watches the real ego and measures it by that ideal If such an institution does exist it cannot possibly be something which we have not yet discovered we only need to recognize it and we may say that what we call our *conscience* has the required characteristics Recognition of this institution enables us to understand the so called *delusions of observation* or more correctly of *being watched* which are such striking symptoms in the paranoid diseases and may perhaps also occur as an isolated form of illness or intercalated in a transference neurosis Patients of this sort complain that all their thoughts are known and their actions watched and overlooked they are informed of the functioning of this mental institution by voices which characteristically speak to them in the third person (Now she is thinking of that again now he is going out) This complaint is justified—it describes the truth a power of this kind watching discovering and criticizing all our intentions does really exist indeed it exists with every one of us in normal life The delusion of being watched presents it in a regressive form thereby revealing the genesis of this function and the reason why the patient is in revolt against it

For that which prompted the person to form an ego ideal over which his conscience keeps guard was the influence of parental criticism (conveyed to him by the medium of the voice) reinforced as time went on by those who trained and taught the child and by all the other persons of his environment—an indefinite host too numerous to reckon (fellow men public opinion)

Large quantities of libido which is essentially homosexual are in this way drawn into the formation of the narcissistic ego ideal and find outlet and gratification in maintaining it. The institution of conscience was at bottom an embodiment first of parental criticism and subsequently of that of society a similar process takes place when a tendency towards repression develops out of a command or prohibition imposed in the first instance from without The voices as well as the indefinite number of speakers are brought into the foreground again by the disease and so the evolution of conscience is regressively reproduced But the revolt against this *censorial institution* springs from the person s desire (in accordance with the fundamental character of his illness) to liberate himself from all these influences, beginning with that of his parents and from his withdrawal of homosexual libido from those influences His conscience then encounters him in a regressive form as a hostile influence from without

The lament of the paranoiac shows also that at bottom the self criticism of conscience is identical with and based upon self observation. That activity of the mind which took over the function of conscience has also enlisted itself in the service of introspection which furnishes philosophy with the material for its intellectual operations This must have something to do with the characteristic tendency of paranoiacs to form speculative systems

It will certainly be of importance to us if we can see in other fields evidence of the activity of this critically watching faculty which becomes heightened into conscience and philosophic introspection I would refer here to what Herbert Silberer has called the functional phenomenon one of the few indisputably valuable additions to the theory of dreams Silberer as is well known has shown that in the states between sleeping and waking we can directly observe the translation of thoughts into visual images but that in these circumstances we frequently have a presentation not of a thought content but of the actual state of the mind (readiness fatigue etc) of the person who is struggling with sleep Similarly Silberer has shown that often the end of a dream or some section of the dream-content signifies merely the dreamer s own perception of his sleeping and waking He has thus demon

trated that self-observation—in the sense of the paran ac s delu on f be g watched—plays part in dream format on This part is ot in an ble pr bably I overlooked it be ca se t does not appear n my own dreams to a y great ext nt in per ons who are gifted philosoph cally and th ref re accustomed to intro pect on, t may become very clear

We may here r call our disc ery that dream form tio takes place under th sway of a cens rship whi h compels di tortion of the dream tho ghts. expressed in the following formula two cases must be distinguished—in the first the erotic cathexes are *ego syntonic in accordance with the ego tendencies* in the second on the contrary those cathexes have suffered repression In the former case (where the path taken by the libido is acceptable to the ego) love takes its place among all the other activities of the ego Love in itself in the form of longing and deprivation lowers the self regard whereas to be loved to have love returned and to possess the beloved object exalts it again When the libido is repressed the erotic cathexis is felt as a severe depletion of the ego the satisfaction of love is impossible and the re enrichment of the ego can be effected only by a withdrawal of the libido from its objects The return of the libido from the object to the ego and its transformation into narcissism represents as it were the restoration of a happy love and conversely an actual happy love corresponds to the primal condition in which object libido and ego libido cannot be distinguished

Perhaps the importance of the subject and the difficulty in surveying it may be my excuse for adding a few remarks that are rather loosely strung together

The development of the ego consists in a departure from the primary narcissism and results in a vigorous attempt to recover it This departure is brought about by means of the displacement of libido to an ego ideal imposed from without while gratification is derived from the attainment of this ideal

At the same time the ego has put forth its libidinal object cathexes It becomes impoverished in consequence both of these cathexes and of the formation of the ego ideal and it enriches itself again both by gratification of its object love and by fulfilling its ideal

Part of the self regard is primary—the residue of childish narcissism another part arises out of such omnipotence as experience corroborates (the fulfilment of the ego ideal) whilst a third part proceeds from gratification of object libido

The ego ideal has imposed severe conditions upon the gratification of libido through objects for by means of its censorship it rejects some of them as incompatible with itself Where no such ideal has been formed the sexual trend in question makes its appearance unchanged in the personality in the form of a perversion As in childhood to be his own ideal once more where sexual tendencies are concerned is the happiness that man strives to attain

The state of being in love consists in a flowing over of ego libido to the object This state has the power to remove repressions and to restore perversions It exalts the sexual object to the position of sexual ideal Since in cases where the love is of the anaclitic or object type this state results from the fulfilment of infantile conditions of love we may say that whatever fulfils this condition of love becomes idealized

The sexual ideal may enter into an interesting auxiliary relation to the ego ideal Where narcissistic gratification encounters actual hindrances the sexual ideal may be used as a substitutive gratification In such a case a person loves (in conformity with the narcissistic type of object choice) someone whom he once was and no longer is or else someone who possesses excellences which he never had at all (cf above (*c*)) The parallel formula to that given above runs thus whoever possesses an excellence which the ego lacks for the attainment of its ideal becomes loved This expedient is of special importance for the neurotic whose ego is depleted by his excessive object-cathexes and who on that acount is unable to attain to his ego ideal He then seeks a way back to narcissism from his prodigal expenditure of libido upon objects by choosing a sexual ideal after the narcissistic type which shall possess the excellences to which he cannot attain This is the cure by love which he generally prefers to cure by analysis Indeed he cannot believe in any other curative mechanism he usually brings expectations of this sort with him to the treatment and then directs them towards the person of the physician The patient s incapacity for love an incapacity resulting from his extensive repressions naturally stands in the way of such a method of cure When by means of the treatment he has been partially freed from his repressions we are frequently met by the unintended result that he withdraws from further treatment in order to choose a love object hoping that life with the beloved person will complete his recovery We might be satisfied with this result if it did not bring with it all the dangers of an overwhelming dependence upon this helper in his need

The ego ideal is of great importance for the understanding of group psychology Besides its individual side this ideal has a social side it is also the common ideal of a family a class or a nation It not only binds the narcissistic libido but also a considerable amount of the person s homosexual libido which in this way becomes turned back into the ego The dis

satisfaction due to the non fulfilment of this ideal liberates homosexual libido which is transformed into sense of guilt (dread of the community) Originally this was a fear of punishment by the parents or more correctly the dread of losing their love later the parents are replaced by an indefinite number of fellow men. This helps us to understand why it is that paranoia is frequently caused by a wound of the ego by a frustration of the gratification desired within the sphere of the ego-ideal and also to understand the coincidence of ideal formation and sublimation in the ego-ideal as well as the demolition of sublimations and possible transformation of ideals in paraphrenic disorders

Instincts and Their Vicissitudes[1]
